CHAPTER III

PER PUPIL COSTS FOR EACH OF THE EIGHT TYPICAL JOINT VOCATIONAL SCHOOLS

From the costs for the eight typical joint vocational schools serving as guidelines; (1) building costs per pupil, (2) gross operating costs per pupil, (3) State operating costs per pupil and (4) net operating costs per pupil for a joint vocational school were calculated for each of the Eight Typical Joint Vocational Schools. These per pupil costs are presented in table 18 and figures 1 and 2.

Table 18:—Per Pupil Costs for Each of the Eight Typical Joint Vocational Schools

J.V.S. Pupil Population	Building and Equipment	Operating		
		Gross	State Reimbursement	J.V.S. Net

CHAPTER IV

PER PUPIL COSTS FOR EACH OF THE FIFTY-SEVEN JOINT VOCATIONAL SCHOOLS

From the frequency polygons on costs per pupil (figures 1, 2, 3, 4 and table 19), the same four costs were calculated for each of the fifty-seven joint vocational schools on a straight line proportional basis by interpelating between the eight typical schools. These costs; (1) building costs per pupil, (2) gross operating costs per pupil, (3) State operating costs per pupil and (4) net operating costs per pupil for a joint vocational school are presented in table 19 and figures 1 and 2.

Table 19:--Cost Per Pupil by Joint Vocational Schools and Pupil Population

@ School would probably serve the community better if divided into three or four schools. Allotment has been provided on that basis.

* Schools are probably too small to operate most effictively. They should join another district of their choice. Allotments have been provided on that basis.

CHAPTER V

SCHOOL DISTRICT FOR EACH OF THE FIFTY-SEVEN JOINT VOCATIONAL SCHOOLS

In studying for joint vocational school districts, the enrollment limits for a desirable joint vocational school were considered first. Existing programs, existing joint vocational school districts, roads, highways, travel distances and population density were then considerable in forming the districts.

The names of school districts, enrollments grades nine through twelve for 1964-65 and the probable joint vocational school enrollments are presented in tables 20 to 56. Probable joint vocational school enrollment is estimated by multiplying the sum of the enrollments of the schools in the joint vocational school district, nine through twelve by 46.5%* and then by 33%**.

* Ration of State enrollment grades eleven and twelve to grades nine, ten, eleven and twelve, 1964-65.

** If 35% of Ohio high school seniors attend college as is estimated, then 33% of enrollment in grades eleven and twelve provides vocational education for approximately 50% of non-college bound pupils.

APPENDIX A

GENERAL ALLOWANCES AND CALCULATIONS FOR TABLE 3, 5, 7, 9, 11, 13, 15 AND 17

Building Costs

Related classroom	720 square feet and $1,000
Academic classroom	720 square feet and $1,000

Shop, related and academic classroom, library, kitchen and lunchroom areas ÷ .7 to obtain total building area.

Total building cost calculated at $16.00 per square foot.

Academic class size	25 pupils
Number academic classes per day per teacher	5 classes

Number academic rooms and/or teachers equal enrollment ÷ 125.

Operating Costs

Units of operating equal number of vocational and academic teachers.

Cost per unit of operation equals $10,000.

Joint Vocational School is reimbursed $5,230 per unit of vocational education.

APPENDIX B

SPECIFIC ALLOWANCE FOR TABLE 3

Building Costs

Library	items J_1, J_2^- - 1,550 square feet	and $4,000
Kitchen	items L_1^- - 1,050 square feet	and $17,000
Lunchroom	items K_1^- - 2,400 square feet	and $2,000

Operating Costs

Director salary $12,000, reimbursement $5,500.

Sight Costs

20 acres at $2,500 per acre.

APPENDIX C

SPECIFIC ALLOWANCE FOR TABLE 5

Building Costs

Library	items J_1, J_2, J_3 - 1,850 square feet	and $7,000
Kitchen	items LL - 1,875 square feet	and $25,000
Lunchroom	items KK_1, features 1 - 4,500 square feet	and $3,000

Operating Costs

Director salary $12,000.

Supervisory salary $9,000.

Director reimbursement $5,500.

Sight Costs

35 acres at $2,500 per acre.

APPENDIX D

SPECIFIC ALLOWANCE FOR TABLE 7

Building Costs

Library	items J_1, J_2^+, J3, features 1, 2	- 2,250 square feet	and $9,000
Kitchen	items LL+	- 2,300 square feet	and $30,000
Lunchroom	itmes KK_1, features 1^+	- 5,500 square feet	and $3,600

Operating Costs

Director salary $12,000.

Supervisory salary $10,000.

Concepts and Generalizations as a New Approach to Teaching Home Economics Education.

Pieretti, Genevieve

Nevada State Dept. of Education, Carson City

Aug65

EDRS Price MF-$0.18 HC-$2.48 62p.

*CONCEPT TEACHING, *HOMEMAKING EDUCATION, *HIGH SCHOOLS, HOME MANAGEMENT, FOODS INSTRUCTION, NUTRITION INSTRUCTION, CLOTHING INSTRUCTION, TEXTILES INSTRUCTION, CONSUMER ECONOMICS, *CURRICULUM PLANNING, HUMAN DEVELOPMENT, HOUSING,

As the model for the graduate in home economics has changed to one of a decision-maker who has the necessary knowledge and abilities to solve problems and make judgments for himself rather than apply prescriptions learned in school, the concept method of teaching has become more important. A conference in February 1961, called to consider how a national group could give leadership to the reexamination of home economics in the secondary school, began to identify concepts for home economics. Subsequently, six workshops were held, with approximately 175 home economics teachers, teacher educators, and supervisors representing all states participating. Concepts resulting from these meetings are grouped under the following headings -- (1) Human Development and the Family (with a glossary of terms), (2) Home Management and Family Economics, (3) Food and Nutrition, (4) Textiles and Clothing, and (5) Housing. Sample concepts are -- (1) In all societies the individual's place within the society depends primarily upon age and sex, (2) The ways in which plans are communicated may affect their implementation, and (3) Non-nutritional as well as nutritional factors play important roles in food selection. The appendix contains a speech by George W. Denemark, "The Curriculum Challenge of Our Times," and an article by Asahel D. Woodruff, "Putting Subject Matter Into Conceptual Form." (MS)

The Curriculum Challenge of Our Times by George W. Denemark

Putting Subject Matter Into Conceptual Form by Asahel D. Woodruff

Chapter I.

THE ROLE OF CONCEPTS IN TEACHING

The rapid expansion of knowledge in all the basic fields makes it impossible for anyone to know all there is to know about a subject. In an address before the Home Economics Seminar at French Lick, Indiana, Dr. Paul L. Dressel[1] stated that "a meaningful organization of knowledge is necessary if the worth of knowledge is to be appreciated and its utility made apparent." He went on to say that much can be done in synthesizing knowledge by introducing global concepts or ideas which tie together what may previously have been unrelated facts. The advantage, of course, is that an individual can become acquainted with the field by mastering a relatively few significant ideas rather than a great number of specifics.

George W. Denemark[2] writing on "The Curriculum Challenge of Our Times," has also stated this need when he said that "teachers of a given subject cannot teach all there is to know about it. For example, the history teacher, even though he is a college professor teaching at the doctoral level, cannot deal with all of history. Drastic choices must be made between what to include and what to leave out. Nevertheless, some of us have made a futile attempt to 'keep up' with the rapid pace of world events by talking faster or assigning more homework."

Dr. Denemark says that an approach which merits careful reflection by all educators is to focus upon the identification of the fundamental principles, the broad concepts, and the big ideas in the various subject matter fields. The answer, he says, is to carefully assess all fields of study and select those elements of each which will provide the strategic keys to an understanding of other events.

Home Economics is not alone in working on the concept approach. In a number of the basic disciplines, emphasis is being placed on developing a list of significant basic or key concepts, so selected that they will be continuously or recurringly used at higher levels of sophistication.

When the basic concepts of home economics are defined, the content of home economics as a discipline becomes more clear. Then curriculum planning may proceed in a more orderly fashion. In the words of George Denemark:[3]

> In large measure the quality of American Education depends upon the extent to which we are able to conceive of a bold new design for the curriculum. The design must include common commitment to a new set of fundamentals derived from rigorous analysis of every field of knowledge.

---

1. Paul L. Dressel. "The Role of Concepts in Planning the Home Economics Curriculum," Home Economics Seminar, July 24-28, 1961. French Lick, Indiana. A Progress Report, p. 7.
2. George W. Denemark. The Curriculum Challenge of Our Times. NEA Journal, December 1961.
3. Ibid.

> It must also include granting each teacher expanded flexibility to select and choose the specifics best suited to the unique combination of conditions for learning. Achieving the proper balance of stability and flexibility in the curriculum is the challenge of our times for education.

Home Economics is an applied science, drawing its content from research in the social sciences, in the physical and the biological sciences and also from its own research. It also draws from the principles of art and design and applies these to problems of improving home and family life.

In its early days, home economics was concerned primarily with the "hows" rather than the "whys" of practices and procedures. However, as research findings began to contribute more and more to the understanding of the "whys", home economics has been increasingly concerned with applying the findings of research conducted in the arts and the sciences to practical applications. According to Dr. Paul Dressel, "In the present day, the increasing complications of our technology make it impossible to provide the potential practitioner in any vocation with a kit of tools and a set of prescriptions. The model for the graduate is changing to one of a decision maker who has the necessary knowledge and abilities to solve problems and make judgments for himself rather than to apply prescriptions learned in school."[4]

Asahel D. Woodruff[5] stressed the importance of cultivating individual decision-making behavior when he said: "If a learner acts on another person's decisions, he does not know how, or learn how, to make his own decisions. He learns only to carry out specific acts in specific situations. If we wish to affect his behavior through his own knowledge, we must cultivate his own decision-making processes. This requires that we stop giving him the end products of another person's decisions (conclusions or admonitions), and give him the concepts with which he can make his own decisions."

"A concept," according to Dr. Woodruff, "is a relatively complete and meaningful idea in the mind of a person. It is an understanding of something. It is his own subjective product of his way of making meanings of things he has seen or otherwise perceived in his experiences. At its most concrete level it is likely to be a mental image of some actual object or event the person has seen. At its most abstract and complex level it is a synthesis of a number of conclusions he has drawn about his experience with particular things."

"Its importance," Dr. Woodruff says, is that "Human beings make their decisions, and take their actions on the basis of their concepts about their environment and the particular parts of it which make up a person's situation at any one time. Concepts are the internally lodged elements that determine how a person will react to a particular stimulus situation. People's lives are lived in accordance with their concepts, insofar as they are able to carry out their wishes and intentions."

Herein lies the importance of the concept method of teaching. As individuals gain concepts, they are able to become more competent in decision-making.

Chapter II.

HISTORY OF THE U. S. OFFICE OF EDUCATION'S SECONDARY SCHOOL HOME ECONOMICS CURRICULUM PROJECT

In February, 1961, the Home Economics Education Branch of the Office of Education under the direction of Edna P. Amidon, called a conference in Washington, D. C. to consider whether and how a national group might work to give leadership to a reexamination of home economics in the secondary schools in light of changing social and economic conditions in the world. Dr. Marilyn J. Horn, Associate Director of the Sarah Hamilton Fleischmann School of Home Economics, was one of about 20 persons from the states--state and city supervisors, home economics educators, and subject matter specialists--together with representatives of national organizations, who met with the staff of the Home Economics Education Branch and other units in the Office of Education to consider this problem. The group discussed how they might give leadership in the development of guidelines for home economics in the secondary schools, and how they might give counsel and work with the Home Economics Education Branch staff in initiating such a project.

Edna P. Amidon stated that the reasons for the meeting, and the thinking back of the plans made, were related to the national concern about secondary school curriculums voiced by numerous people. Many in the profession, she stated, had expressed the view that criteria were needed to determine what in present secondary school programs had continuing value, what should be dropped, and what needed to be added in order to better serve today's youth--boys as well as girls.

At this February meeting, this group discussed the status of home economics in secondary schools as revealed by the 1959 national study,[1] reviewed the widespread home economics curriculum development programs underway throughout the United States at state and local levels, and after hearing about work underway in various other subject matter fields in the secondary school, explored the idea of defining the unifying elements in home economics. It was suggested that if the basic concepts in the field of home economics could be identified, that this resource material could be used in nationwide development of curriculum. It was decided that this would be a productive approach. Also, approval was given to the preparation of a position paper on "The Place of Home Economics in the Secondary School" which had been recommended by the Executive Secretary of the National Association of Secondary-School Principals. The Bulletin of the National Association of Secondary-School Principals, Volume 48, Number 296, December 1964 carries this statement in a chapter entitled "Home Economics in the Secondary School."[2]

2. "Home Economics in the Secondary School". The Bulletin of the National Association of Secondary-School Principals, Volume 48, Number 296, December 1964, pp. 89-97. Washington 36, D.C.: National Association of Secondary-School Principals, National Education Association, $2.00

A small start was made at this initial meeting in February on the process of identifying home economics concepts. Then in January of 1962, a subcommittee of five members reviewed a suggested outline of concepts for home economics with some generalizations to support them. This group, also, revised a tentative outline of material on the place of home economics in the secondary school. Next steps in the project were also considered.

Regional Conferences of home economics education workers -- 1962 and 1963.

Progress reports on the curriculum project were made at the 1962 Central and Pacific Regional Home Economics Education Conferences and at the 1963 Southern and North Atlantic Conferences. Through presentations, panel discussions and group work, key home economics educators were informed of the plans for the curriculum development project and became involved in the project.

Workshops

Two workshops were held in 1962--the first at Iowa State University, July 16-18, and the second at Pennsylvania State University, August 13-24. At the Iowa workshop, concepts and generalizations in family relations were developed. At the Pennsylvania workshop, concepts and generalizations in the area of family economics were developed.

In these workshops specialists and consultants worked with teachers, teacher educators and supervisors to develop a conceptual structure with supporting generalizations. In stating the generalizations basic information given in presentations made by specialists in the areas of the workshops and in supporting disciplines were used. After the workshops these materials were revised in the Home Economics Education Branch on the basis of evaluation and suggestions by workshop participants. Further revisions were made by other selected specialists before duplication of the materials was made for their use at the 1963 workshops as working materials.

Four additional workshops were held in the summer of 1963 as follows:

1. Housing, Interior Design and Furnishings, and Equipment. Oklahoma State University, Stillwater, June 10-21.

2. Food and Nutrition. Cornell University, Ithaca, N.Y., June 24 - July 6.

3. Clothing and Textiles. Washington State University, Pullman, July 1-12. (Dr. Marilyn J. Horn, University of Nevada, served as consultant.)

4. The Development of Children and Youth. Merrill-Palmer Institute, Detroit, Michigan, July 22 - August 3. (Attended by Mrs. Genevieve Pieretti, State Supervisor of Home Economics Education, Nevada.)

Approximately 175 home economics teachers, teacher educators, and supervisors representing all states, along with specialists and consultants participated in the workshops and identified concepts and generalizations in the various areas. After further revisions by workshop participants and specialists, another workshop was held in the summer of 1964 at the University of Missouri to refine and combine the materials on concepts and generalizations for the different areas of home economics which were developed in the 1962 and 1963 workshops.

After final editing by the staff of the U. S. Office of Education, the concepts and generalizations were duplicated and sent to the State Supervisors of Home Economics Education for use in curriculum planning and in teaching. (See Chapter III.)

Relating work of secondary and college groups

While the work was being done on the Secondary School Curriculum Project, colleges were also becoming interested in the concept approach to teaching. In July, 1961 a seminar was held at French Lick, Indiana sponsored by the Home Economics Division of the American Association of Land-Grant Colleges and State Universities. Those who attended the February 1961 conference called by the Home Economics Education Branch were invited to this seminar along with others who were concerned with secondary education. These persons considered implications of the work being done at the Seminar to the secondary school curriculum study.

A plan for continued cooperation between Land-Grant College committees working on definition of content, and the Home Economics Education Branch was made.

With a member of the Home Economics Education Branch of the U. S. Office of Education as a consultant, Dr. Alberta D. Hill, a group of teacher-educators met at the University of Nevada in Reno, October 1964, to develop concepts and generalizations for teacher education in home economics. They considered competencies needed for home economics teachers and developed major concepts and generalizations under each competence. Teacher educators, also, will be using the concept method of teaching.

CURRICULUM RESOURCE MATERIAL
Conceptual Framework and Generalizations in Home Economics

The theory that the identification of basic concepts and generalizations would provide structure for various areas of home economics and valuable resource material for curriculum building was accepted by those who met for a curriculum conference in 1961, and by others who attended the workshops which followed.

A curriculum that is structured on unifying concepts is flexible and can be adjusted to local conditions and to changing conditions, both of which can affect the curriculum. Once the pertinent concepts and generalizations have been identified, the content to develop them can be chosen from among a wide range of possibilities. Also, a curriculum so structured can easily be reviewed in the light of new ideas and information; this would be useful in indicating research which might be needed and in suggesting new approaches to the curriculum. In addition, the identification of concepts and generalizations should facilitate the evaluation of the teaching-learning process.

This paper gives the outlines of concepts and generalizations for home economics developed in the workshops held in 1962 and 1963, and brought together in the 1964 workshop. They are organized under the following headings:

-- Human Development and the Family

-- Home Management and Family Economics

-- Food and Nutrition

-- Textiles and Clothing

-- Housing

The terms concept and generalization are defined in many ways in writings on curriculum. Therefore, it is important to indicate how they are used in this material.

Concepts are abstractions used to organize the world of objects and events into a smaller number of categories. They have many dimensions and meanings and constitute the recurrent themes which occur throughout the curriculum. Examples of concepts which appear in the following pages are:

-- Development and socialization of the individual (See p. 4)

-- Resources and their utilization (See p. 10)

-- Nature of food (See p. 16)

Generalizations express an underlying truth, have an element of universality, and usually indicate relationships. Examples of generalizations which appear in this paper are:

-- As more services are built into foods, the control of industry over the kinds and quality of food increases while that of the home decreases. (See p. 18)

-- The attitudes and information of the meal planner about food and nutrition influence the nutritional adequacy of the food served. (See p. 19)

In developing the generalizations included in this paper, the following criteria were used as guidelines:

-- The generalization is based on objective data, on experience, or on theory accepted by specialists in the field.

-- The terms used have clear and precise meanings.

-- The development of the generalization is an important task of the school.

-- The generalization will provide insight in dealing with new situations in social and cultural learnings.

-- There is a reasonable possibility of learners developing some understanding of the generalization through experiences in the home economics curriculum in the high school.

Since these five outlines were developed by different groups, they are not entirely uniform. Three of the outlines are introduced with brief explanatory statements while the other two are not. The variations in the outline form under which the conceptual structure and generalizations are organized are evidence of the independent work of the subject-matter groups. All generalizations have an Arabic numeral.

HUMAN DEVELOPMENT AND THE FAMILY

The conceptual structure and generalizations for this outline were developed from two separate outlines prepared in two separate workshops--the Iowa State University workshop which focused on Family Relationships, and the Merrill-Palmer workshop which focused on Development of Children and Youth. The two outlines were fused into one because to some extent they overlapped and because it was felt that a single outline would be more useful as resource material for developing home economics secondary school courses or units of courses dealing with child growth and development, and with personal and family relationships.

Numbers in parentheses appearing in certain statements of generalizations refer to the Glossary of Terms included at the end of this outline.

I. Universality of individuals and families

1. In all known societies there is a recognized unit that assumes the functions of child bearing, child rearing, regulation of behavior, and economic support.

2. Cultural patterns are transmitted from one generation to another primarily through the family (1).

3. There are more similarities in family patterns within one culture than there are in family patterns of different cultures.

4. Every known society and every individual has values which give direction to behavior and meaning to life.

5. In all societies the individual's place within the society depends primarily upon age and sex.

6. Within each individual there is an urge to grow (2) toward his fullest potential.

7. There is a universal and irreversible pattern of individual human development (3).

II. Uniqueness of individuals and families

1. Each individual is unique and this uniqueness helps to account for variations in family units within the same culture.

2. There is a reciprocal relationship between the family and society.

3. Each individual family member affects and is affected by his family.

4. Cultures differ according to what is considered acceptable and normal behavior.

5. Since every individual, every family, and every society is unique, the process of socialization (4) is different for each individual.

6. Each individual differs from every other individual in his inherent potentialities.

7. Each individual is unique in his potentialities and in his pattern and rate of development.

III. Development and socialization of the individual

1. Development is continuous and proceeds in an orderly sequence with periods of acceleration and deceleration occurring in each phase of development.

2. When one aspect of development is taking place at an accelerated rate, other aspects may seem to be on a plateau.

3. Critical periods occur throughout the life span during which an individual's total development, or some aspect of it, is particularly sensitive to environmental influences.

4. The human organism has a great capacity for physical, mental, and social self-repair and for adaptability.

5. To the extent that an individual's developmental needs are met as they occur, he is free to move toward his full potential.

6. To the extent that an individual's developmental needs are met consistently and in an atmosphere of emotional warmth and love, he seems to develop a basic trust in himself and in the world around him.

7. Situations conducive to the development of self-respect are those in which the individual is valued as a person of intrinsic worth and dignity.

8. Maturation is change in structure that cannot be measured in amount by means of a standard measuring scale, but can be appraised by reference to an orderly sequence of qualities, features, or stages.

9. Maturity is revealed in an individual's use of the resources available to him to develop his potentialities.

10. A mature adult copes (5) with his environment, shows a certain unity of personality, and is able to perceive and accept the world and himself realistically.

11. The human organism is an open, dynamic system, constantly taking in stimulation from its environment, and constantly behaving in response to the stimulation; such behavior, in turn, affects and changes the environment.

12. Modeling (6) is a particularly effective technique for learning roles, attitudes, and values.

13. When an individual experiences satisfaction from the results of a particular pattern of behavior, he is likely to incorporate that pattern into his behavior.

14. The sense of self (7) grows gradually and continually as the individual participates in an ever-widening environment.

15. Creativity is the capacity to innovate, invent, or reorganize elements in ways new to the individual.

16. In the process of self-development the individual builds up a set of values which are important criteria for his decision making.

17. Value systems are developed as a person's needs are met, as he thinks about and reacts to his experiences, and as he adjusts to change.

18. Some of the most influential and compelling values are held unconsciously.

19. The more accurately the individual perceives his values, the greater his ease in choosing among alternatives of action.

20. Socialization results from a continuous interaction of the individual and his environment.

21. An optimal atmosphere for the socialization process in our society seems to provide a combination of affection and control.

22. Each person's behavior is influenced by the attitudes, values and interpretations of his environment that he has accumulated through his experiences.

23. Values are learned from early and continued experiences in the family, with poor groups, and in the community.

24. The needs of parents and children are sometimes complementary and at other times conflicting.

25. The individual's interpretation of his own role (8) and of the roles of other family members influences his interaction within the family.

26. Families and communities share responsibility for offering children and youth opportunities for education, for maintaining physical and mental well-being, for recreation, for protection from danger, and for developing religious faith.

IV. Challenge and creative possibilities of change

1. The task of socialization is more complex in societies where there is rapid social change.

2. Social change resulting from technological advances, political strategy, and newly emerging or absorbed ideologies places strain on cohesion within and between families.

3. Individuals resist change.

4. Change generally occurs first in the material aspects of culture; this in turn produces change in the nonmaterial culture.

5. Technological changes, advances in science, and improved communication and transportation have resulted in other social agencies assuming some of the responsibilities traditionally performed by the family.

6. When individuals understand change and have some methods and resources for coping with it, they can be a force in determining the direction of change.

Glossary of Terms

1. The family in America: the basic social institution composed of persons united by ties of marriage, blood, adoption, or by common consent; characterized by common residence and economic cooperation.

2. Growth: change in amount or degree of a bodily attribute (structure) which can be measured by means of some standard measuring scale.

3. Human development: all processes of change both in the body itself (structure) and in its behavior (function), from conception through old age.

4. Socialization: a process whereby the individual learns the ways of a given culture; involves learning to know himself as well as his environment.

5. Coping: purposeful problem-solving, behavior.

6. Modeling: the process whereby an individual incorporates into his own behavior the perceived behavior of another with whom he identifies intentionally or unintentionally.

7. The self: a composite of the individual's thoughts, abilities, feelings, values, and perceptions of his roles, as well as his concept of himself.

8. Role: a function assumed by an individual or a group in a particular situation.

HOME MANAGEMENT AND FAMILY ECONOMICS

Home management includes decision-making and the organization of activities involved in the use of resources for defining and achieving goals of families.

I. Environmental influences on individual and family management

A. Societal

1. Conditions in society influence stability and/or change in availability and use of resources.

2. The demands and expectations of society present management opportunities and responsibilities to individuals and families.

3. Individuals and families have the responsibility to provide for their own welfare beyond the basic expectations of, and protection provided by, society.

B. Economic

1. The family economy affects and is affected by the larger economy.

2. Total income and/or goods and services available for consumption are influenced by individual and family productivity.

3. Individual and family choices influence, and are influenced by, market conditions and marketing practices.

II. Managerial processes

A. Decision-making

1. Decision-making reflects varying degrees of rationality.

2. Decisions are affected by the interaction of factors which influence managerial behavior.

3. Rational decisions represent choices resulting from logical analyses of the elements of situations.

4. The decisions of individuals and families reflect differences in the perception of goals and goal achievements.

5. Satisfactory decisions may involve family members in different ways at different times.

6. Disadvantages as well as advantages are usually inherent in the alternatives involved in a decision or choice.

7. Risk and uncertainty in decision making vary with people and situations.

B. Organization of activities

1. Organization is the way in which individuals and families carry out activities.

2. The organization of different individuals and families differs in aim and effect.

3. Plans may incorporate more than one decision.

4. The implementation of plans may involve reappraisal and adjustment of procedures to meet changing conditions.

5. Individuals and families may facilitate management through creating routine procedures and coordinating activities.

6. The ways in which plans are communicated may affect their implementation.

7. Effective organization is related to optimal use of resources.

8. Anticipated outcomes and incentives energize organizational processes.

III. Effective elements in management

A. Resources and their utilization

1. The perception of available resources may enhance or limit the management potential of individuals and families.

2. The assessment of a resource in terms of other resources or managerial activities clarifies its contribution to management.

3. The availability and/or scarcity of resources affect the range of choices.

4. Different forms or combinations of resources may yield similar satisfactions.

5. The cost of using resources for any purpose is that which must be given up because of such use.

6. The optimal use of resources varies with differences in families and situations.

7. The changes in the circumstances accompanying family life stages influence the availability of resources and the demands made upon them.

8. Families differ in resources available to meet economic needs and risks.

B. Values, goals, and standards

1. Management by individuals and families reflects differences in values, goals, and standards.

2. Values serve as guides for developing goals.

3. The extent to which goals are realistic is affected by the assessment of resource potential.

4. Flexibility in standards influences adaptability to changing circumstances.

5. Families holding similar values may seek different goals.

6. The rank order of an individual's or family's values may vary in different situations.

7. Clarity of values, goals, and standards is affected by experience in management.

FOOD AND NUTRITION

I. Significance of food

A. As related to cultural and socioeconomic influences

1. The knowledge that nutrition is related to health, longevity, and general well-being has unfolded through centuries of human experiences and has developed into a science that changes and expands with the additional findings of research.

2. Food habits of individuals change as a result of indirect influences such as changes in supply resulting from advances in production, technology, and distribution; economic resources; and the educational, social, and cultural environment.

3. The adequacy of the food supply of people in all parts of the world has an effect upon people everywhere.

4. Distribution of food from areas of surplus to areas of scarcity is necessary for the physical, economic, and psychological well-being of people and carries political implications.

5. The kinds of foods, the ways they are prepared, their grouping in meals, and even the manner in which they are served and eaten constitute the food customs that are characteristic of a country or region. Though these customs differ widely, they can meet nutrient needs equally well.

6. Specific foods, methods of preparation and serving, and times at which foods are eaten, acquire symbolic meanings associated with religious beliefs and ceremonies, social usages, status, ethnic and family traditions, maturity levels, and masculine and feminine roles.

7. The role of food as a socializer, as an aid to breaking down communication barriers, and as a symbol of hospitality and friendliness justifies an appropriate use of resources.

8. Skill in food planning and preparation can be used to satisfy family values and goals and for gainful employment.

B. As related to nutrition

1. All life is composed of, and requires, combinations of elements which, when utilized to form and maintain tissues or sustain activity, are known as nutrients. Food is the usual source of nutrients.

2. Individuals have need for all nutrients, but their differences in ability to store and snythesize nutrients influence the kind, amount, and timing of intake needed for the most effective utilization of food.

3. Combinations of elements required by living organisms are classed as proteins, lipids, carbohydrates, minerals, vitamins, and water.

4. Each nutrient has specific functions; in some cases one nutrient is known to influence the functioning of another nutrient or other nutrients.

5. The energy needed for growth, maintenance, and bodily activity is provided by the oxidation of lipids, carbohydrates, and proteins.

6. All nutrients are used by the body to build and maintain tissues and to regulate body processes. The various tissues and body processes have characteristic nutrient needs.

7. Inadequate, excessive, or imbalanced intakes of nutrients may be detrimental to health.

8. The amount and kind of nutrients needed by individuals vary and are influenced by heredity, age, sex, size, activity, climate, and physical and emotional state.

9. The digestion, absorption, and utilization of food components are interrelated processes influenced by the physical and chemical nature of the foods ingested, the physical and emotional state of the individual, and the interactions of the various nutrients in the metabolic process.

10. The optimum frequency of eating in relation either to physiological comfort or to utilization of nutrients is not known and may differ with individuals and situations.

11. Adequate nutrition can be attained with many combinations of foods commonly available throughout the world. No single food pattern is essential to health.

12. Basic to the development and evaluation of adequate food patterns is knowledge of the nutrients needed by the body and their sources in available foods.

13. Instinct is not a reliable guide for food choices; how to select an adequate diet needs to be learned.

C. As related to physiological and psychological satisfactions

1. Non-nutritional as well as nutritional factors play important roles in food selection.

2. The primary satisfactions provided by eating include the relatively immediate sensory and physiological effects it produces and the psychological meanings it has acquired.

3. Hunger is an uncomfortable physiological state which occurs in the absence of food and often influences and may dominate behavior until relieved.

4. The occurrence of hunger is affected by the time lapse since the last intake of food, the amount and composition of food eaten, the habits of the individual in relation to each of these, his emotional state, and perhaps his inborn hormonal balance.

5. The degree of comfort or discomfort experienced after eating is influenced by the particular foods eaten and their total volume and the interaction of emotional and/or physiological stress with digestive activity.

6. The association of food with intimacy from the day of birth may make it a means of nonverbal communication of love or indifference, acceptance or rejection, and other emotional feelings.

7. Emotional stresses, having no connection with foods in their origin, may be expressed in irrational behavior toward food such as criticism, rejection, or overeating.

8. People are likely to accept a wide variety of foods if they have wide experience, knowledge, and appreciation of foods and if their environment reinforces positive rather than negative attitudes.

9. Wide acceptance of food by the individual can mean easier adaptability to varied social environments and differing economic circumstances, and increased likelihood of obtaining adequate nutrition and pleasure from food.

10. Food habits and preferences are a product of complex interactions among physiological and psychological satisfactions associated with food, beliefs about foods, and economic resources.

11. Food habits like other behavior patterns are subject to deliberate modification by those who are motivated to change and act accordingly but are highly resistant to direct attempts to change.

12. An individual's food habits may be such an integral part of his personality complex that efforts to change may damage his capacity to function effectively.

II. Nature of food

A. Chemical and phsyical properties

1. A few foods are pure chemical compounds which contain only one nutrient, but most foods are complex systems made up of many chemical compounds, some of which do not have known nutritive value.

2. Similarities in the physical structure and chemical composition of foods are the bases for their classification, handling, and processing.

3. The usefulness of a food in the human diet may be limited by the presence of toxic substances and/or pathogenic microorganisms.

4. The appearance, texture, flavor, temperature, and other sensory qualities that influence the acceptability of food products depend upon the physical and chemical properties of the food.

5. The inherent color of food is determined bythe presence of naturally occurring or chemically produced pigments and those physical properties of the food itself which affect light reflectance. The color seen is affected by external factors such as light source and background color.

6. The texture of a food is dependent upon the physical structure of its components. Texture is recognized by sensations induced by various sensory receptors. Structures associated with texture include: crystalline and amorphous solids; liquids of varying degrees of viscosity; and mixtures of liquids, solids, and/or gases in such forms as foams, gels, and emulsions.

7. Flavor is determined by the chemical composition of a food and, for most foods, by small amounts of many different compounds. Flavor is experienced through the taste and odor sensory organs.

B. Factors effecting change in properties of food

1. The intensity and characteristics of some sensory qualities of food can be changed by temperature and depend upon personal sensitivity.

2. Genetic factors and agricultural practices may influence the chemical composition and physical structure of raw foods and make it possible to produce foods with the specific properties required for a variety of processor and consumer uses.

3. The sensory qualities, nutritive value, and safety of foods may be altered by the physical and chemical environment such as changes in temperature, kind of manipulation, and the presence of water, oxygen, and other chemical substances. These changes are usually interrelated and are often affected by time.

4. The storage life, geographic distribution, and variety of food products can be increased by processing food in various ways such as refining, preserving, and manufacturing of new products.

5. Knowledge of the significant chemical constituents and physical systems present, and of the principles governing the physical and chemical processes used, contributes to understanding and control of the physical and chemical changes that occur during food processing and preparation.

6. Directions for obtaining a product of given characteristics are reliable only when the nature of the original food or food mixture, and the effect of the physical and chemical processes to which it will be subjected are considered.

7. The physical processes commonly employed to alter the nature of food include: heating by conduction, radiation, and internal generation; cooling; evaporating; dialyzing; dissolving; emulsifying; crystallizing; agitating; fractionating; and comminuting.

8. Food storage and preservation methods are designed to retain or enhance the initial nutritive value, safety, and sensory qualities of food through the control of natural maturing processes, the growth of contaminating

microorganisms, and a variety of chemical reactions and physical changes.

9. Research continually extends our understanding of and ability to control the nature of food and its behavior.

10. Technological developments that result in changes in the nature of food and food products often bring a need for changed procedures in food handling, storage, and preparation.

III. Provision of food

A. Production

1. As more services are built into foods, the control of industry over the kinds and quality of food increases while that of the home decreases.

2. Changes in agricultural practices, in technological developments, and in size and the composition of population affect per capita supply, distribution, and consumption of food.

3. When there is a scarcity of land and an increase in population density, the reliance on primary (plant) sources for food increases, and the discovery and use of new sources of food become increasingly important.

4. Technological growth and current sociological trends promote developments in food processing, acceptance of a variety of food forms, and changes in patterns of consumption.

B. Consumer practices

1. Rational choice becomes more difficult as the number of food products and ways of merchandizing them increase.

2. Consumers' choices are a determinant of marketing practices, prices, and of the qualities of foods in the market.

3. Informed consumers making rational and discriminating choices in the purchase of food can influence the functioning of the market to serve consumer interests and to improve the effective use of resources.

C. Protective measures

1. Safety of food is determined by the natural qualities, by the procedures used in the production and processing, and by the sanitary measures used in the handling and storing of food in the market and in the home.

2. Federal, State, and local agencies work toward the protection and guidance of consumers in their purchase of certain foods by assuring the wholesomeness of these foods and their freedom from adulteration, by establishing standards of identity, by requiring truthful labeling, and by prohibiting false statements in advertising.

3. When there is evidence that the addition of a particular nutrient or other additive to a food serves a useful purpose, government defines and regulates such additions.

4. The support and cooperation of informed citizens increase the effectiveness of government and private agencies in improving the quality, safety, and quantity of the food supply.

D. Management of resources

1. The attitude and information of the meal planner about food and nutrition influence the nutritional adequacy of the food served.

2. The individual's knowledge of nutrition contributes to a wider freedom of choice among foods in attaining adequate nutrition.

3. Discrimination is required in the selection of foods that contribute a balance of nutrients to the daily diet and at the same time fulfill such non-nutritive requirements for daily meals as are involved in meeting food budgets, family traditions, and individual preferences.

4. Nutritional knowledge helps the individual evaluate food fads, fallacies, and sensational claims which may be harmful to health or lead to economic problems.

5. Participation in planning, preparing, and serving meals can be a source of pleasure and satisfaction, and can provide an opportunity for aesthetic and creative expression.

6. Participation in accepted social practices can contribute to the individual's facility and sense of security in various situations involving food.

7. The organization of activities in providing food for the family involves planning and coordination of resources and family demands.

8. The resources available for meeting personal and family food needs include personal capacities, available goods and services, and purchasing power.

9. While a competent manager can reduce the amount(s) of money needed for food, there is a practical minimum below which it becomes increasingly difficult to acquire adequate nutrition and to provide culturally accepted variety in food.

10. Use of resources for household food production is influenced by the values (nutritive and non-nutritive) placed on food, the kind and quality of resources available, and the personal satisfaction derived from producing food.

11. The choice of which resource to use in providing food for the family depends upon the quantity of each resource available, the cost of the alternatives and their effectiveness in producing the desired result, and the ability of the user to employ the resources for the purpose desired.

12. Family food costs will vary with the size and composition of the family, the value placed on food, and the resources available.

13. Performance of routine tasks according to a plan designed for repeated use facilitates planning, preparing and serving food.

TEXTILES AND CLOTHING

I. Significance of textiles and clothing to the individual in society

A. Interrelationship of clothing and culture

1. In all cultures dress has provided a means of: physical protection; self-adornment; conveying status; group, role, and sex identification; portraying ritual symbolism; and self-expression.

2. Dress, including self-adornment, emanates from the culture and reflects the political, economic, and religious mores of the times.

3. Variations in clothing exist within a culture as well as among cultures.

4. Clothing customs are transmitted from group to group, generation to generation, and from the society to the individual.

   a. Some customs of dress are only folkways, and conformity to these is not essential to the welfare of the group; other customs of dress are considered mores and embody the basic moral values of the culture.

   b. Dress takes on new meanings and associations as the social environment changes. Similar, but not necessarily identical, customs are carried from generation to generation.

   c. Individuals learn by social sanction what clothing behaviors are accepted in the culture.

5. Clothing reflects social attitudes and values and is related to social change.

   a. Individuals who are able to challenge the status quo bring about innovation in dress which may become integrated into the culture.

   b. The rate of fashion change is related to the rate of change in culture.

   c. Clothing may present a value model for the masses and be an instrument in shaping the values of the multitude.

6. The cultural background of the individual influences choices, means of acquisition, and use of textiles and clothing.

7. Surviving fragments of clothing are tangible resources for the study of cultures of the past, and help to preserve the elements of a culture for future generations.

B. Social and psychological aspects of clothing

1. Clothing is related to group identification and group behavior.

   a. Clothing often reflects social stratification because attitudes and clothing practices may differ at the various socioeconomic levels.

   b. Clothing becomes a less reliable indicator of social class or economic status as similar kinds of clothing become increasingly available to all persons.

2. Clothing is a means of communicating role.

3. An individual may be more readily accepted in a particular role if he conforms to the group's clothing expectations for that role.

4. Clothing may help the individual to make adjustments when changing from one role to another and to attain success in that role.

5. In order to conform to the accepted clothing customs of a group, the individual must accurately perceive these customs.

6. Clothing may be used as a means of satisfying basic needs when these needs are not met in other ways.

7. Clothing is used in defense or enhancement of the self.

8. Clothing reflects an individual's self-concept.

9. Clothing and decoration function to convey the individual's mental state, moods, and feelings to others.

10. Clothing is a cue to personality; it conveys an impression of what the individual is, does, and believes.

11. An individual uses clothing as a cue in forming impressions of others.

    a. Impressions made by appearance and dress have greater impact in limited contact situations.

    b. In order to create desired impressions through dress, the individual needs to be aware of the meaning dress communicates to others.

12. As an individual matures, his clothing perceptions and values change.

C. Clothing as a medium for artistic perception, expression, and experience.

1. Clothing may be a source of beauty and personal satisfaction.

2. Clothing may be a means through which the components of art are perceived, illustrated, and experienced.

3. Art components in clothing may be utilized to express meanings, feelings, ideas, and emotions.

4. The elements of art and dress may be organized in such a way that the effect of individual elements is intensified, tempered, or obscured.

5. Variation in the use of art components may alter the frame of reference in which we see the human form.

6. Clothing as a form of artistic expression reflects the cognitive, moral, and social aspects of the era, culture, or society in which it is created.

7. "Taste" in dress refers to sets of values used by an individual or a society in making critical judgments or fine discriminations.

8. Taste is affected by education, by one's perceptual abilities, and by the moral pattern of an era.

D. Textiles and clothing in the economy

1. Production and distribution of textiles and clothing influence consumption patterns of individuals and families.

2. Methods and risk involved in the production and distribution of textiles and clothing influence the quality, cost, and availability to the consumer.

3. The textile and clothing industry is affected by the consumption patterns of individuals and families.

a. Consumer response to fashion change will result in adjustments in the clothing industry.

b. Producers and distributors adjust the quality of clothing merchandise to the amount of money consumers will spend.

c. Political, social, psychological, and geographic factors influence what is produced in the textile and clothing industry.

4. The complex interaction of the world economy, the clothing industry, and consumption patterns affect the cost, quality, and availability of goods to individuals and families.

5. The welfare of society may be affected by economic decisions of the clothing industry, governments, and consumers.

E. Physiological aspects of textiles and clothing

1. Clothing facilitates adjustment of the human body to the environment.

2. The comfort of clothing is influenced by fabric, finish, construction, and style, and the suitability of these for various activities.

3. The physical condition of the human body influences the type of clothing selected.

II. Nature of textiles and clothing

A. Textiles

1. Textiles are products of fiber and/or yarn, fabric construction, and finish.

2. Each fiber has physical and chemical properties which affect its performance in a fabric.

a. Fibers vary in such properties as length, luster, resiliency, strength, and crimp, and also in their reaction to such conditions as light, moisture, temperature, and stress.

b. Some characteristics of fibers may not be retained in the finished fabric if blended or combined with other fiber(s) or modified during some stage in the manufacturing process.

c. Fibers may be modified both chemically and physically to produce desirable characteristics for specific end uses.

3. Differences in yarns result from variations in ply, twist, count, weight, crimp, texturizing processes, and other design variations.

4. The characteristics of yarns produce variation in fabrics with respect to texture, design, function, and end use of the fabric.

5. Fibers and/or yarns may be converted into cloth by various methods such as weaving, knitting, knotting, interlacing, bonding, felting, extruding.

6. Fabric construction is a determinant of the properties of the end product; fabrics produced by different methods have definable characteristics,

7. Finishes may be applied to fabrics to produce and control desired qualities.

8. Factors influencing the choice of finish for a fabric are: the type of fiber and its arrangement in yarn and fabric, the receptivity of the fabric to various finishing preparations, the extent to which the fabric can be chemically modified, and the use for which the fabric is intended.

9. The finished textile will give more satisfactory service when the characteristics of the fabric are compatible with intended end use.

10. Knowledge of the physical and chemical characteristics of textiles and clothing helps individuals and families predict their performance and gain increased satisfaction from selection, use, and care.

B. Garments

1. Garments are combinations of textile and apparel materials, design, and construction.

2. The extent to which component parts of a garment are compatible determines the functional and aesthetic value of the garment.

3. The engineering in the basic construction of a garment affects its appearance, comfort, and performance.

a. The position of fabric grain in a garment influences fall and pliability of the fabric on the figure. Fabric grain can be distorted by stitching, pressing, and handling during the construction process.

b. The adjustment of fabric to body contour may be accomplished through the manipulation of darts and seams, and the incorporation of ease allowances.

c. The appearance and durability of a garment depend upon the accuracy and detail of workmanship in the construction.

III. Acquisition and use of textiles and clothing

A. Selection

1. The factors involved in making clothing decisions include the individual's resources, needs and desires, family composition, and stage in the life cycle, and on the mobility of people, climatic conditions, social environment, and stage in the fashion cycle.

2. The choices made in the acquisition and use of clothing are influenced by the individual's value patterns and the relative importance of his various clothing goals.

3. The decisions made in regard to clothing are affected by the interaction and emotional interdependence of family members.

4. The resources available for meeting clothing needs include available goods and services, purchasing power, personal information, ability, time, and energy.

5. The availability and use of resources for achieving clothing goals are related to the allocation of resources to other individual and family goals.

6. The information provided by agencies and industry through such means as labels and advertising is one resource which may assist the consumer in predicting the performance of textiles and clothing.

B. Use and care

1. The suitability of a textile product for its intended use is dependent upon the nature of the textile, its design, and its construction.

2. The utilization of a textile product is related to the care needed and the facilities available for providing that care.

3. The type of care needed by the product will be determined by the nature of the textile, construction, and ornamentation.

C. Responsibilities of consumers

1. The consumer can improve production and distribution of textiles and clothing by communicating needs, wants, satisfactions, or dissatisfactions to the retailer and the manufacturer.

2. The consumer's purchase of any item of clothing denotes to the retailer or manufacturer approval of the item.

3. The return of items that are unsatisfactory to the consumer is one way of communicating with retailers and manufacturers.

4. The concerted effort of consumers can bring about improved standards of clothing products and increased consumer information.

5. Full utilization of resources and fulfillment of social responsibility require knowledge of, and adjustment to, social and technological change.

HOUSING

Housing fulfills many functions for man. It is the means of modifying his environment to meet his physical needs such as comfort and safety, his psychological needs such as privacy and security, and his social needs for recognition and interaction with people. Man uses satisfaction of housing needs as a means of self-expression.

Housing performs social and economic functions for society. Many of a society's values, patterns of living, and economic, technological, and cultural nature developments are conveyed manifested in housing.

The community, neighborhood, the dwelling itself, and its furnishings and equipment are all aspects of man's housing environment. Some components of housing include location, structure, design, furnishing, and equipment.

Housing takes many forms including multi-family and single family dwellings, apartments, dormitories, rooms, mobile homes, tents, and retirement houses. Housing may be mobile or stable. It may be located in urban, suburban, rural, or in various vacation areas.

The first workshop called to develop material in this area was called Housing, Interior Design and Furnishings, and Equipment. In this outline the title has been shortened to Housing.

I. Influence of housing on people

A. Physical and psychological

1. Housing provides the setting for the physical and emotional development of individuals and families.

2. The characteristics of environment such as temperature, humidity, lighting, noise, odors, fumes, orderliness, and aesthetic qualities affect the physical and psychological well-being of individuals.

3. The variables in a dwelling such as air temperature, relative humidity, and air movement affect heat loss from the human body and therefore physical comfort.

4. The space organization, structural design, and location of the dwelling influence the ease or difficulty of housekeeping tasks and the types of activities engaged in by the individual and/or family.

5. The number, size, design, and location of storage facilities can simplify or complicate family living.

6. The amount of space and its organization affect the physical, psychological, and social reactions of people.

7. The aesthetic character of housing affects the social activities of individuals and relationships between family members.

8. The aesthetic character of housing affects the mental well-being of the housing occupants.

9. Beauty attained through the use of color, design, texture, orderliness, and scenic views contributes to minimizing psychological fatigue.

10. The use of color in a home is decorative and has a psychological effect.

B. Social

1. Housing provides the setting for the social development of individual and family members and their interactions.

2. The family affects the neighborhood and its environment and in turn is affected by the neighborhood and its environment.

3. Housing and its surroundings are status defining for individuals and families.

II. Factors influencing the form and use of housing.

A. Human

1. Housing enables man to satisfy some of his basic physiological, psychological, and social needs.

2. Man needs shelter for protection, headquarters, privacy, and self-expression.

3. The extent to which an individual's psychological need for beauty is satisfied is related to his aesthetic appreciation.

4. The human factors which influence the form and use of housing are individual and family needs, values, attitudes, aesthetic and educational levels, abilities, and skills.

5. The individual's or family's physical, social, and psychological needs, way of living, and resources influence the choice of dwelling, furnishings, and equipment.

6. Housing standards are influenced by incomes, values, attitudes, educational levels, and housing knowledge.

7. An individual's or a family's requirements for housing change with varying conditions of society, and with variations in the family situation.

8. Persons with physical and mental limitations have special housing needs.

9. The physical condition, age, and personality characteristics of individuals affect the degree to which the dwelling, furnishings, and equipment are used safely.

10. Man consciously or unconsciously expresses his values through housing.

11. The values of individuals and families, their standards, their ways of living, and their preferences affect the neighborhood environment.

B. Environmental

1. Environmental factors which influence the form and use of housing are social, economic, cultural, technological, physical, and political (governmental).

2. Neighborhood and community developments reflect the social organization and cultural values of citizens.

3. The resources expended on housing by a nation or community affect the form, quality, and quantity of available housing.

4. Development and expansion or deterioration and reduction of housing units in a community are affected by policies and activities of Federal, State, and local agencies.

5. The size, design, and construction of housing are affected by zoning ordinances, building restrictions, and by other housing in the community.

6. Planning for neighborhoods and communities is affected by factors such as the role and quality of government agencies and their public support, and by the cooperative or conflicting interests of different individuals and groups in the community.

7. Services, facilities, and utilities supplied by the neighborhood and/or community affect the ways by which an individual or family satisfies its housing needs and wants.

8. Science and technology make it possible for man to regulate environmental conditions within the dwelling by controlling temperature and humidity, providing adequate and appropriate light, controlling noise and odors, and developing aesthetic qualities in the dwelling.

9. Certain technological changes which alter the external environment intensify the need for freedom from distracting noises and for air that is safe from chemical pollution.

III. Processes in providing housing

A. Designing

1. Design is the process of organizing the basic elements of line, form, shape, texture, and color.

2. Art principles are means of design organization.

a. Balance is equilibrium in a design organization.

b. Harmony is the relatedness or agreement among the parts of a design.

c. Rhythm is organized movement in a design.

d. Emphasis is giving significance to those parts of a design considered important.

e. Proportion establishes relations between divisions of space.

f. Scale establishes relations between man and space.

3. Unity is the oneness of a design.

4. Variety is a difference or diversity.

5. Design is the end product of the organization of the basic elements.

6. Form refers to an organization of structural elements in which a designer has expressed his conception and vision.

7. Function as it is understood in architectural theory is an integration of purpose and form at its highest level with beauty as an integral part.

8. Designing any aspect of housing offers opportunities for creativity.

9. Creation of an aesthetic interior requires the harmonious integration of furnishings with structural components.

10. Background interest results from organization of decorative elements.

11. An interior assumes an individual character as the designer responds to the life of the inhabitants and the building structure.

12. The design of housing is affected by the individual and family life cycles and the ability of the designer as well as by the locality, site, and materials available.

13. Advances in technology lead to change in design theory, and change in design theory leads to advances in technology.

14. The extent to which housing satisfies an individual's or a family's desire for privacy depends upon the site, the neighborhood, the placement of the house on the lot, landscaping, and the arrangement of space within the house.

15. Landscaping adds to the beauty, function, and economic value of housing and relates a house to its site and neighborhood.

16. The quality and quantity of lighting affect the function and decorative aspects of rooms.

17. The kind and amount of illumination needed in housing vary with the physical surroundings, the demands of the physical tasks, and the visual acuity of the occupants.

18. Glare occurs when the source of light is too bright for its distance from the seeing task, when the source of light is exposed, when there is a wide contrast, and when the light is intensified by reflection.

19. The quantity and quality of lighting affects the ease of doing visual tasks.

B. Selecting

1. The advantages and disadvantages of buying an existing house (old or new), buying land and having a house built, or of renting, are related to the needs, wants, and resources of the specific individual or family.

2. Rational decisions in selecting, building, or remodeling a house are influenced by the ability of a family to analyze its needs, to recognize areas in which assistance is needed, and to use sources of reliable information and professional services.

3. The decision as to whether to own or rent a dwelling requires weighing of the psychological and financial advantages and disadvantages from the immediate and long-term viewpoints.

4. Rational choice of location and site of housing involves consideration of the climatic conditions, the availability of desired services, and needs, desires, and activities of the individuals or family.

5. The limiting factors in the selection of housing are scarcity of dwellings on the market, availability of materials, inadequate financial resources, governmental restrictions, discriminatory practices, and lack of information.

6. A knowledge of the availability and characteristics of materials, building processes, furnishings, and equipment provides a basis for making rational decisions concerning housing.

7. Legal and other professional advice regarding housing affords protection against ill-advised undertakings and guards against fraudulent and unfair schemes.

8. Space organization, structural design and location of the dwelling influence selection and arrangement of furnishings and equipment.

9. Safety in housing is affected by the type and quality of materials and construction.

10. The factors affecting the choice of fuel for the home are the comparative advantages and disadvantages in its use, availability and cost, user's preference, and practicality of installation.

C. Building

1. The advances in technology and change in design theory result in new building materials and methods of construction.

2. The materials and methods of construction influence the form of housing.

3. The quality of housing is related to quality of design, materials, and methods of construction.

4. The materials and methods used in construction influence the total cost of housing.

5. The adequacy of the installation of utilities affects the safety and efficiency of equipment.

   a. Safety in home wiring is obtained by using materials that carry the label of the Underwriters Laboratories, by installing materials in accordance with requirements of the National Electrical Code and local codes, by keeping wiring in repair, and by using appropriate circuit breaking devices.

   b. Adequacy of home wiring affects the number and kind of appliances that can be used at one time and the performance of heating appliances, motor driven appliances, and lighting.

   c. Where there are regulating agencies, utilities for new and remodeled housing are subject to inspection and approval.

6. Central location of utilities in a dwelling is an economic advantage.

7. Safety in the use of electric equipment is conditioned by safety in home wiring, ratings of fuses and circuit breakers, location of outlets and switches, suitability of outlets, adequacy and repair of insulation within appliances and cords, and precautions in the use of equipment.

D. Financing

1. Housing financing is an integral part of over-all financial management and requires the making of rational decisions with regard to fitting housing expenditures within individual and family income.

2. The kind and amount of housing space a family can secure is influenced by the amount of money available and by its purchasing power.

3. The monetary value of housing changes as the relationship between supply and demand changes.

4. The costs of dwellings vary according to structural design, construction standards and codes, methods and materials used, locality, age of the structure, and condition of repair.

5. Using resources such as time, energy, and money for obtaining housing, furnishings, and equipment requires giving up the use of these resources for other purposes.

6. The willingness and ability of individual family members to do some of the construction of the dwelling and its contents and to do some of the maintenance of the property are means of extending the family income.

7. Factors involved in the total cost of home ownership depends on the sale price; on whether housing is bought for cash and/or credit; the size and terms of loan, if any; taxes; insurance; closing costs; depreciation; and maintenance.

8. Understanding of financing procedures and costs provides a basis for rational decisions in obtaining housing.

9. Financing policies and practices affect the quality of the physical characteristics of the house, its design, materials and construction.

10. The cost of credit for housing is affected by the rate of interest and the length of the amortization period.

11. The terms of mortgages vary among various types of lending institutions as to the maximum amount that can be borrowed, tenure of the mortgage, and rate of interest.

12. The amount and kind of housing insurance purchased is influenced by the need, income, value of the house, nature of the housing mortgage, and cost of the insurance.

13. The consumer's selection of housing, furnishings, and equipment affects marketing and production practices.

14. The cost of using major equipment includes the original purchase price, the cost of installation, operation, maintenance, and repair, and the loss of interest on money if invested.

E. Furnishing and Equipping

1. Furnishings and equipment are means by which man adapts housing structures to his private use.

2. Family composition, values, goals, standards, patterns of living, and available funds and space influence the

kind and quantity of furniture and equipment acquired by an individual or family.

3. The selection and arrangement of interior furnishings are based on needs, personal preferences, and the individual's concept of design.

4. Aesthetic satisfaction in home furnishings requires consideration of personal values, interests and concept of design.

5. Homemaking tasks are facilitated by equipment appropriate for the individual or family and installed or stored for maximum convenience.

6. Well-based decisions in the selection, use, and care of equipment and furnishings are dependent upon the user's being informed of new products and changes in design, materials, and construction.

7. Decisions to buy, make, or remodel furniture, draperies, or floor covering depend upon one's interest and available human and material resources.

8. Efficiency in equipment is affected by the design, construction materials, installation, suitability for the job, and maintenance of the equipment, and the skill with which it is operated.

9. Returns from an investment in equipment depend upon its appropriateness for the purpose(s) to be achieved, the skill and frequency with which it is used, the efficiency of its operation, and the utilization of its special features.

10. The purchase of equipment of an established brand from a reputable dealer increases the possibility of dependable servicing.

11. An understanding of the meaning and the reliability of available seals is useful in buying equipment.

12. The frequency with which the equipment is used is related to convenience of storage or its arrangement in the work center.

13. The arrangement of equipment and supplies in work centers influences the expenditure of time, motion, and energy needed.

14. When safety is emphasized in the selection, placement, installation, and use of household furnishings and equipment, the possibility of physical injury to occupants and damage to property is reduced.

F. Managing

1. Management related to housing involves decisions regarding the allocation of human and material resources.

2. Housing is a resource used in attaining individual and family goals.

3. The extent to which an individual or family can satisfy housing wants and needs depends upon available income and its purchasing power and ability to manage resources.

4. Private and governmental agencies, mass media, and educational institutions are sources of information and assistance for the selection, use, and care of housing, furnishings, and equipment.

5. Planning functional work areas involves decisions on the amount of space needed, according to the characteristics of the individual(s) who will perform the tasks, and decisions on the organization of the equipment and supplies.

6. The arrangement of the work areas affects the organization and direction of work, the methods used and efficiency in the performance of activities.

7. Counter space between work areas helps reduce steps by providing a stacking, loading, and holding zone.

G. Maintaining

1. Public and private maintenance of individual and public sites affects the beauty, safety, and economic value of property.

2. A knowledge of the characteristics of materials used in construction is valuable in the use and care of equipment and furnishings.

3. The proper use and care of furnishings and equipment reduce maintenance and repair costs.

4. The safety of housing is influenced by its construction and maintenance of materials.

GPO 890-798

Chapter IV.

USING THE CONCEPTUAL FRAMEWORK AND GENERALIZATIONS IN THE TEACHING-LEARNING PROCESS

During the past several years in a series of curriculum workshops sponsored by the University of Nevada and the Nevada State Division of Vocational Education, Nevada homemaking teachers have developed a series of curriculum guides using concepts and generalizations developed in the workshops sponsored by the U. S. Office of Education in its Secondary School Curriculum Project.

Since curriculum guides using the concept approach are not yet available in some areas of home economics, homemaking teachers may find the steps as outlined below of some help as they plan to use the concept method of teaching.

STEP 1.

In preplanning for teaching an area of the home economics curriculum, a teacher needs first to think of her objectives. What is the student like? What developmental tasks is she facing? What needs are apparent through observation, pupil-teacher planning, a study of the community or a study of the needs of society? In this preliminary planning, a teacher will find it helpful to study the conceptual framework and generalizations of the area, to refer to State or County curriculum guides for suggestions as to what may be appropriate to teach at that level, and to make some preliminary decisions as to appropriate objectives or desired outcomes for the unit.

STEP 2.

Decide on the major concepts and generalizations for the unit. For example, in a unit on housing at the Homemaking I. level in the Nevada State Curriculum Guide, the following concepts and generalizations were chosen for development.

<u>Concept 1. Influence of housing on people</u>

Generalization: The use of color in a home is decorative and has a psychological effect.

<u>Concept 2. Factors influencing the form and use of housing</u>

Generalization: Man consciously or unconsciously expresses his values through housing.

<u>Concept 3. Processes in providing housing</u>

Generalization 1: The selection and arrangement of interior furnishings are based on needs, personal preferences and the individual's concept of design.

<u>Sub-Generalization</u>: The choice and placement of accessories for the purpose of personalizing and beautifying the interior are influenced by such factors as types of furnishings, space, use, elements and principles of design.

Sub-Generalization: Making or improvising furniture or furnishings provides opportunities for creative expression, developing family interests and stretching the family budget.

Generalization 2: Homemaking tasks are facilitated by equipment appropriate for the individual or family and installed or stored for maximum convenience.

Sub-Generalization: The amount, kind and location of storage needed depends upon the possessions and activities of the individual or family.

STEP 3.

Once a decision has been made concerning the major concepts and generalizations for a unit, the planning for learning activities can begin. For each generalization selected, the teacher may select one or more appropriate desired outcomes, select appropriate text and reference materials, consider facts and background materials students need to know, and plan learning activities which will help students to arrive at the generalization.

EXAMPLE OF TEACHING PLAN

Generalization: Making or improvising furniture or furnishings provides opportunities for creative expression, developing family interests and stretching the family budget.

Desired Outcome: Becomes aware of values in making or improvising furniture or furnishings.

My Wishbook of Home Furnishings. pp.22, 25-34.

Background Information:

1. Making something attractive out of something unlovely and inappropriate is an achievement that carries with it tremendous satisfaction for everyone who participates.

2. Ideas can save money. A little ingenuity can sometimes result in a very attractive substitute for an expensive piece of furnishing.

3. Handicrafts give a feeling of pride in workmanship. However, what you make for your home should be useful and attractive. Often the simplest things are the most beautiful.

4. Some things that can be made for a bedroom are:

- - Bookshelves, made from boards and a few bricks, glass or concrete blocks.
- - Dressing table, made from orange crates or unpainted chests connected with a board or plate glass.
- - A bench or stool, made from an inverted nail keg, an old round piano stool or a low chair with a back removed.
- - Drawer dividers.
- - Closet accessories.
- - Curtains and bedspreads.

Learning Experiences:

1. Visit homes where family members have improvised or made furnishings. Ask family members to describe satisfactions they received or listen for expressions of satisfactions.

2. Ask class members to describe projects which their family members have created.

3. Read references on do-it-yourself projects.

4. Plan and carry out a project for the homemaking department or for your own home.

5. As a home experience, make something for your own home.

Summary Questions to help students formulate generalizations in their own words:

1. What were the big ideas we have been discussing during the past few days?

2. What discoveries have we made as we visited homes where families have created things for their homes, or as we have read about ideas for do-it-yourself projects, or as we have actually created something ourselves?

3. How might you apply these ideas in a new situation?

4. What are the basic ideas we can formulate out of this?

Dr. Barbara Osborn,[1] Associate Professor of Home Economics Education, University of Connecticut, gave these suggestions for teachers to use as guidelines for teaching students to generalize:

1. After selecting concepts, guide the thinking of students through asking questions; guide the students to locate, interpret and evaluate supporting facts; use a variety of experiences.

2. Lead students to point out the differences and similarities among the factors in a situation and to begin to draw conclusions.

---

1. Osborn, Barbara. "A Lesson Outline for Concept Teaching," Penneys' Fashions and Fabrics, Spring/Summer 1965.

3. Ask students to state conclusions orally or in writing of complete sentences. This enables the teacher to discover mistaken ideas and re-teach if necessary. These first conclusions should be tentative since generalizations must be based on many experiences.

4. If students have misconceptions, plan and present additional experiences to clarify the concept.

5. Ask for conclusions of students and accept the kind of statements that students are ready to make. They may not be able to generalize as broadly as you had anticipated and may state generalizations very differently than you did when planning. It is important to recognize when they are saying the same thing though using different words and to accept their first attempts at stating generalizations.

6. Plan further experiences in applying the generalizations. This will increase the understanding of them and develop ability to use them.

Dr. Osborn has also suggested that teachers use the following criteria to evaluate the generalizations they select in curriculum planning:

-- Is the generalization needed for solution of problems important to the student? Will it lead to insights in dealing with new problems?
-- Is the student ready for the generalization? Has he had meaningful experiences from which to generalize?
-- Is the generalization based on objective data or theory accepted by specialists in the field?
-- Is there a reasonable possibility of developing the generalization through experiences in high school home economics?
-- Is the generalization necessary for further growth in ability to think in the area?

Remember that concepts grow out of experience in pursuit of a problem or purpose of some sort. The school, therefore, must provide many and varied experiences. Opportunities for observation, handling, experimentation, and discovery are necessary.

Concepts are not achieved quickly nor at a given time. They are never fixed or final. Levels are to be discerned. The process goes on continuously. Concepts are achieved ordinarily through an active, dynamic process, not through a formal or so-called "logical" process (except with very well-informed, mature learners).

Concepts to be developed should be carefully selected and then presented through many and varied learning experiences.

Burton, Kimball and Wing[2] in "Education for Effective Thinking" have given some suggestions for teaching which will help students develop an understanding of concepts. They remind teachers of the importance of learners being provided with as rich and varied environments as circumstances will permit. The school must often compensate for a meager neighborhood environment.

---

2. W. N. Burton, R. B. Kimball and R. L. Wing, Education for Effective Thinking. New York: Appleton-Century-Crofts, 1960.

This means that learning situations and activities should be provided to make it possible for learners to come into contact with numerous and vivid, clear-cut examples of things, persons, processes and relationships for which concepts are being achieved. The examples of things, processes, and relationships should be met as far as possible through direct experience. Direct experience (field trips, for example) should be supplemented by vicarious experience obtained by means of motion pictures, radio and television programs, dramatizations, lectures, pageants, and many types of printed materials.

Learners should be stimulated to reflect upon and to analyze experiences, illustrations, meanings, and the process of developing concepts. Reflection and analysis are almost certain to result if the learning situations are lifelike and meaningful to the learners.

Learners should be encouraged to state their understanding (meaning growing into concept) in simple everyday terms, as far as possible. This is a simple direct test for the possession of meaning; a verbalist cannot state meanings in everyday words. Learners should be encouraged to illustrate concepts with specific situations drawn from their own experience. When a concept is difficult to put into words, students can be encouraged to demonstrate his understanding in other ways such as drawing pictures, making models, presenting dramatizations. If a student cannot express what he knows in some manner, the teacher can assume he does not know. Learners should be taught to avoid meaningless repetition of words that they have read or heard.

THE CURRICULUM CHALLENGE OF OUR TIMES[1/]

By
George W. Denemark
Dean, School of Education, University of Wisconsin, Milwaukee;
formerly Executive Secretary of the Association for Supervision
and Curriculum Development, NEA.

Is it possible to combine both stability and flexibility in the modern school curriculum? Can common objectives for education be established that allow ample room for adapting learning experience to individual learners, teachers, and community settings? Can we achieve broad national commitment to certain goals in elementary and secondary education while still preserving the character of community and regional strengths? Can various subject fields and different grade levels build on each other without necessitating a tightly regimental instructional program that makes the teacher a technician rather than a professional? What can be done to provide continuity of education for the twenty per cent of our school children who are in a new school each year?

17 These questions represent the major dimensions of the central curriculum issue facing our schools today. The issue is not what a small group of attention-seeking writers and speakers would have us believe. It is not a choice between a standardized traditional curriculum devoted to the fundamentals and an individualized curriculum growing out of the emerging interests of each child. It is not a superficially simple either-or choice at all, for our times demand large measures of both stability and flexibility in the education of every boy and girl.

We cannot afford to choose stability or flexibility, continuity or adaptability, enduring cultural values or urgent problems of contemporary life, group welfare or individual fulfillment. Good education demands all of these components, not half of them. Today's thoughtful teachers and administrators are increasingly asking themselves how these important ingredients may best be combined in a curriculum for elementary and secondary schools.

One approach that merits careful reflection by all educators is to focus upon the identification of the fundamental principles, the broad concepts, the big ideas in the various subject fields. Closely associated with this emphasis is a growing concern for the interrelationships between fields of knowledge--linkages between fundamental ideas associated with different subjects or areas of inquiry. The combination of these approaches has much to offer those concerned with a design or rationale for modern school curriculum.

1/ NEA Journal, December 1961. Copied with the permission of the NEA Journal.

What has always been true must be obvious to all today: Teachers of a given subject cannot teach all there is to know about it. For example, the history teacher, even though he be a college professor teaching at the doctoral level, cannot deal with all of history. Drastic choices must be made between what to include and what to leave out. Nevertheless, some of us have made a futile attempt to "keep up" with the rapid pace of world events by talking faster or assigning more homework.

Such measures cannot solve the dilemma confronting today's teacher, for the curriculum sandwich is already stacked so high with miscellaneous layers of information and detail that few if any learners can manage a solid bite. The answer lies in carefully assessing all fields of study and selecting those elements of each which provide the strategic keys to an understanding of other events.

These questions should guide this process: What are the fundamental principles, the central concepts, the major ideas associated with a field of study? Which ideas are central to an understanding of the methods of inquiry unique to that field? Which ideas underlie a whole series of other ideas and are thus essential if any real understanding of that field is to come about?

Lest this approach be understood by some to mean a return to an old-fashioned, traditional curriculum, let us be clear that it implies instead revolution in the various subject fields. This revolution is already under way in certain subject fields such as mathematics, biology, physics. Fortunately, the revolution is being led by some of our most eminent scholars, for it demands that the most penetrating, searching kinds of analyses be made of each discipline for the purpose of identifying its unique structure, its basic principles, its central ideas. Classroom teachers and other curriculum workers must join with scholars and scientists in the search for these central ideas and must take the initiative in designing school curriculums that reflect and communicate them.

Discovery on the frontiers of knowledge is important in every field and important to us all, but perhaps even more important, at least at this moment in history, is the discovery of a fundamental rationale--of an organizing framework within which new knowledge can be viewed and interpreted. The best minds in each discipline must be focused on this important task.

As insight is gained into the fundamental principles of knowledge in various fields, every teacher at every grade level and in all subject fields will have the task of planning specific learning experiences that will focus on these principles in such a way as to enrich and illuminate each child's understanding and utilization of them. The task will, of course, remain a never-ending one, necessary as long as knowledge and experience expand.

Such a concept of curriculum can help teachers of all age levels and all subjects to understand the basic unity of teaching as a profession and of learning as a continuing process. Such a concept will provide continuity to education, for the most fundamental, most far-reaching principles

will have relevance at the kindergarten level, just as they will at the graduate school level and at each school milestone along the way.

Such a concept makes it possible for a student to relate his experiences in a high-school English class to those he is having in history class. The education of the engineer or architect can be viewed not only in terms of drafting and mathematics but in terms of art and music as well, for the principles of balance and of rhythm will be seen to have application in many facets of living. The education of a skilled professional in law, medicine, engineering, or other vocational field will be perceived as having its beginnings in the grasp of fundamental principles introduced in the elementary school and continued through high school and the general-education programs of college or university.

Some people might object that such a plan would result in endless, boring repetition of a narrow scope of learning in grade after grade and subject after subject. Actually, however, the range of specific content and experience is unlimited, and repetition is involved only as relationships between specific learning experiences are made clear in the process of enlarging a concept or general principle.

This does not differ from the way in which any concept is developed: through progressively widening a circle of experience by observing many areas in which an idea has application. For example, we come to a fuller understanding of the meaning of democracy as a way of life by viewing examples of democratic behavior not only in politics but also in labor-management dealings, in family relationships, in religious institutions, in teacher-pupil relationships, and the like. The concept grows beyond its political meaning as opportunities are presented to reflect on its relevance to other dimensions of human relationships.

19

An illustration of generalization and a possible set of related learnings may be helpful in understanding this approach to curriculum planning. One of the important ideas which many educators believe schools should help to communicate is the generalization that a person's ideas of right and wrong, of importance, of good, are heavily influenced by his social-cultural environment. In other words, what someone believes is determined in large measure by the values of his nation, church, school, and family and by other environmental influences, Such an understanding could be developed in countless ways at various age levels and through many different content fields. Here are but six to serve as illustrations.

1. Soon after children enter school, a teacher might point out and discuss differences among them with respect to certain religious beliefs and practices. The discussion could touch upon the fact that some religious denominations in the United States prohibit their members from saluting the flag or repeating the Pledge of Allegiance.

2. A geography lesson in the intermediate grades focusing on a study of the West Indies might call attention to the fact that as a result of experiences under the rule of Denmark prior to World War I many Virgin Islanders today associate working in the fields, or even gardening, with inferior social status.

3. At an appropriate point in her course, a home economics teacher might call students' attention to the fact that in certain areas of the United States white eggs bring a premium price because housewives consider them better than brown ones, while in other areas exactly the reverse is true.

4. In tracing the patterns of authoritarian ideas, a high-school history class might examine how the doctrine of Aryan superiority indoctrinated in German school children during the Hitler regime led many German youth to support the persecution of minority groups in the name of patriotism.

5. A college anthropology class studying various customs of other cultures might give attention to the Kwakiutl Indians of British Columbia, who still practice a ceremony called "potlatch," in which the status of an individual is determined not by how much property he owns but rather how much he has given away.

6. In a course in tests and measurements, a college instructor might refer to a study of answers given on an intelligence test which showed that an item concerned with the musical term "sonata" resulted in unusually large differences in the per cent of correct response when analyzed according to the social-status background of the students tested.

These are six specific areas of content which might be dealt with at some point in the education of a student from kindergarten to graduate school. On the one hand, they might be viewed as six discrete learning experiences. On the other, they might be seen as illustrations of the general principle identified earlier--that a person's ideas of right and wrong, of importance, of good, are heavily influenced by his social-cultural environment.

For the most part, the importance of the specific knowledge associated with each separate illustration is slight, but the importance of the generalization toward which they all point is tremendous and pervasive. The student who truly grasps this generalization will have learned a fundamental lesson applicable to a wide range of personal and societal relationships.

It is easy to see in these illustrations that the particular facts chosen are not critical to the major learning involved. True, they must be relevant and sufficiently unambiguous to prevent confusing the learner. Which illustrations are used, however, will vary--must vary--according to a number of significant variables in the learning situation. Deciding factors may be the interests of the particular children in the class; the background and experience of the teacher; the nature of the community and the cultural background and ethnic composition of its members; the books, films, field trips, and other learning resources that are available; or significant events in the news. All of these and more represent important variables in the teaching-learning situation that might cause a teacher to employ one content rather than another as the basis for communicating a generalization to his students.

The teacher who had traveled in Mexico rather than in the Virgin Islands might wish to see cultural patterns of that nation as a basis for building understanding of the link between personal values and cultural patterns. The interests of some children in explorers or scientists might cause a teacher to cast her illustrations in those areas. Teaching in a culturally deprived section of Chicago populated by recent immigrants from many cultures would perhaps suggest a different set of illustrations than would teaching in one of the fashionable, culturally homogeneous suburbs of that same city.

This approach to teaching calls for flexibility, imagination, and creativity. It calls for as many differentiated educational activities as there are varying combinations of pupil interests, teacher competencies, community resources, and world problems. It rules out use of a single textbook, courses of study repeated dully year after year, dusty specimen exhibits dragged out annually and single standards of achievement enforced uncritically throughout entire communities and states. It offers countless opportunities for individual teachers and school faculties to design learning experiences that truly fit the learner and the community. Teaching will be exciting to teachers as they assume creative roles in selecting and ordering the content which fits the unique combination of factors composing a particular teaching-learning situation.

In large measure the quality of American education depends upon the extent to which we are able to conceive of a bold new design for the curriculum. The design must include common commitment to a new set of "fundamentals" derived from rigorous analysis of every field of knowledge. It must also include granting each teacher expanded flexibility to select and choose the specifics best suited to the unique combination of conditions for learning. Achieving the proper balance of stability and flexibility in the curriculum is the challenge of our times for education.

21

PUTTING SUBJECT MATTER INTO CONCEPTUAL FORM

2/6/64 ADW

1. THE COGNITIVE CYCLE IN BEHAVIOR AND LEARNING

Cognitive processes operate in a learning-behaving cycle, a model of which is useful in discussing teaching processes and materials. See attached figure.

2. SOME DIFFERENT FORMS OF CONCEPTUAL ELEMENTS IN THE LEARNING-BEHAVING CYCLE

PERCEPTS (The sensory beginnings of concepts)
CONCEPTS (Organized perceptions; the raw material from which decisions and behavior are produced)

Of Processes
Of Structures
Of Qualities

Derivations from conceptual knowledge:
Topical organization of knowledge for "filing" purposes
Items of information (verbal form) related to concepts
Definitions of terms

23 CONCLUSIONS (Part of the process of decision-making when one is seeking a line of action in a situation that requires an adjustive act)

Derivations from conclusions:
Admonitions (Recommendations to others based on previously reached conclusions)

3. REQUIREMENTS FOR CULTIVATING INDIVIDUAL DECISION-MAKING BEHAVIOR

If a learner acts on another person's decisions, he does not know how, or learn how, to make his own decisions. He learns only to carry out specific acts in specific situations. (Following procedures)

If we wish to affect his behavior through his own knowledge, we must cultivate his own decision-making processes. This requires that we stop giving him the end products of another person's decisions (conclusions or admonitions), and give him the concepts with which he can make his own decisions.

4. THE NATURE OF A CONCEPT

Definition:

A concept is a relatively complete and meaningful idea in the mind of a person. It is an understanding of something. It is his own subjective product of his way of making meaning of things he has seen or otherwise perceived in his experiences. At its most concrete level it is likely to be a mental image of some actual object or event

the person has seen. At its most abstract and complex level it is a synthesis of a number of conclusions he has drawn about his experience with particular things.

Its importance:

Human beings make their decisions, and take their actions on the basis of their concepts about their environment and the particular parts of it which make up a person's situation at any one time. Concepts are the internally lodged elements that determine how a person will react to a particular stimulus situation. People's lives are lived in accordance with their concepts, insofar as they are able to carry out their wishes and intentions.

A Conceptual Statement:

A description of the properties of a process, structure, or quality, stated in a form which indicates what has to be demonstrated or portrayed so a learner can perceive the process, structure, or quality for himself.

Kinds and Examples of Conceptual Statements:

Process Concepts

24

A concept of a process, event, or behavior, and the consequences it produces when it occurs. A statement of this kind should take this form:

When { this / or / these } { event(s) / process(es) / behavior(s) / circumstance(s) / quality(ies) / structure(s) } { occur(s) / exist(s) } { it / they } will tend to produce { this result / or / these feelings / or / these conditions / or / these reactions }

e.g.

When dissipative forces are increased, matter tends toward the gasious state.

When individual politicians with similar goals organize themselves for political purposes, they become much more effective in achieving their goals.

Structural Concepts

A concept of an object or structure of some kind. e.g. a physical object, a chemical structure, or a geographical unit. A statement of this kind should take this form:

This	object process quality idea condition place organization etc.	has these elements	height depth width number substance motion time units	in this	form structure configuration	

e.g.
Electrons exist in more or less concentric electron shells surrounding a nucleus.

Atomic crystals consist of atoms in a regular arrangement.

Amorphous solids are composed usually of large, long chain molecules which are entangled with each other.

Cherryvale's business district is three blocks long and one block wide.

Concepts of Qualities

25

A quality is a property of an object or process and has no independent existence. Nevertheless, we speak of qualities as if they had independent existence, by abstracting them, or taking them out of the objects or processes in which they are found and treating them in the abstract.

However, qualities operate in our thinking in the same way as structures and processes. We see them as structural entities, or we see them as processes having certain effects. "Square" is an abstract structural concept. "Kind" is an abstract process concept.

A concept of a quality will therefore take the same form as any structural or process concept.

e.g. (Structural)
A square has (or squareness is having) four sides of equal length which are connected by right angles.

(Process)

Speed causes accidents.
When people are honest (fulfill obligations and honor the rights of others) security is increased for all.

Quasi-Concepts and Statements

Many conclusions that have been reached by people are put in less than complete form, and lack something of helping a reader come to an understanding of life, offering him instead the judgment of another without substantiating data. In contrast, a fully stated concept supplies the data on which a conclusion is based, and permits a person to examine the evidence for himself. Hence, it offers the possibility of more complete comprehension, and the freedom of individual acceptance or rejection of the conclusion.

Statements of believed or established fact have the nature of "information" but they do not in and of themselves play a central role in the decision-making process. In order to become useful in that manner, they must be turned by the listener into his own concepts, or complete thoughts about a process, a structure, or a quality. This is usually difficult for him to do because he lacks the perceptual background. Examples of conclusions, which are quasi-conceptual statements are:

America is a haven for the oppressed.
Truth is beauty.
Religion is a force for good in human life.

Conclusions lead to the formation of admonitions, which are often offered to students as subject matter. Examples are:

Oppressed people ought to go to America.
Everyone should be truthful.
Religion should be encouraged.
Our natural resources ought to be protected.
Farmers should plow along contour lines.

5. PUTTING SUBJECT MATTER INTO CONCEPTUAL FORM

a. Be sure the author's conclusion or admonition is stated concisely and clearly so his intent and meaning are clear.

b. Find the events, of which the writer was aware, that led him to reach the conclusion. Cite the events, and the consequences. Put them into an if...then form, as a process concept.

c. If the subject matter consists of information, that is, data in verbal or symbolic form, three possibilities exist:

(1) Have the students memorize it.

(2) Recast it in conceptual form, as a concept of structure, or process, or quality.

(3) Ignore it.

Much information, when it is directly related to a useful concept, is itself useful even in verbal form, and justifies memorization. To put it into conceptual form and teach it as concepts is time consuming. If its usefulness can be realized in verbal form, and if concepts of the verbal information are of marginal value, the time and labor to recast the materials is not justified. Information which is not directly related to some useful concept is not worth memorizing.

The Cognitive Cycle in Behavior and Learning, with Forms of Conceptual Elements Located in Relation to the Decision-Making Process

*COOPERATIVE EDUCATION, *WORK EXPERIENCE PROGRAMS, SECONDARY SCHOOLS, DROPOUT PREVENTION, TEACHER QUALIFICATIONS, *PROGRAM PLANNING, CHILD CARE WORKERS, HOMEMAKERS ASSISTANTS, NURSES AIDES, FOOD SERVICE WORKERS, CLOTHING AND TEXTILE WORKERS, *OCCUPATIONAL HOME ECONOMICS, ADMINISTRATOR GUIDES,

Vocational Education Act of 1963,

As required by the Vocational Education Act of 1963, part of the home economics program includes classes for high school girls and/or boys who wish to prepare for gainful employment utilizing home economics knowledge and skills. Ohio offers the cooperative 2-year program, and the occupational work experience which is designed primarily for the 11th and 12th grade students of limited ability in a single skill area. The manual gives state requirements for student eligibility, teacher qualifications, space, and equipment and procedures for establishing and administering job training programs. The appendix contains program outlines, job description, job opportunities, and characteristics of trainees for -- (1) child care workers, (2) homemaker's assistants, (3) nursing and rest home aides, (4) food service workers, and (5) clothing service workers. The criteria for vocational approval, and application forms for job training programs are also given. (MS)

INTRODUCTION

An increasing number of women now assume a dual role - that of homemaker and wage earner. They need preparation for both roles, since the proficiency with which a woman can carry both will determine the quality of her home and family life and her effectiveness as a wage earner.

The Vocational Education Act of 1963 provides the opportunity for education in gainful employment for occupations involving knowledge and skills in home economics. This Act emphasized the need to develop programs which meet the needs of persons attending high school.

The following are the general characteristics of the job training programs for high school students in home economics:

- The purpose of the program(s) is to prepare persons enrolled in high school for gainful employment in an occupation which uses home economics knowledge and skills.

- The programs are offered in the eleventh and/or twelfth grades.

- Types of programs are determined by available job opportunities, needs, and abilities of persons to be trained.

- The training program is an integral part of the total school program, thus allowing students enrolled to complete requirements for graduation.

- The program combines and coordinates instruction with field, laboratory, and work experience.

- Entry into occupation is the focus of the program.

- Preparation for employment is a more specialized type of program than one which centers on preparation for home and family living.

- The instruction needs to be sufficiently inclusive and, at the same time, intensive enough to insure preparation for wage earning.

This Manual of Operation interprets and explains the purposes and programs of vocational education in home economics which is directed toward job training in occupations using home economics knowledge and skills.

VOCATIONAL HOME ECONOMICS EDUCATION

HIGH SCHOOL PROGRAMS DESIGNED TO PREPARE INDIVIDUALS FOR GAINFUL EMPLOYMENT

GENERAL INFORMATION

Purpose of the Program

To offer Vocational Home Economics Education classes for high school girls and/or boys who wish to prepare for wage earning (at the completion of high school) in an occupation utilizing home economics knowledge and skills.

Groups to be Served

Girls and boys, enrolled in 11th and 12th grade high school (approximately 16 to 18 years of age), who wish to prepare for wage earning occupations while they are completing high school requirements for graduation.

Youth enrolled in school grades (9-12) who are potential drop-outs due to academic, socio-economic, or other handicaps that prevent them from succeeding in the high school program. They are often handicapped academically due to low intellectual ability and/or due to a lack of educational and cultural advantages. These students are frequently two to four years behind normal reading level.

Types of Schools Where Program Can Be Offered

A job training program in Vocational Home Economics may be offered in either a Comprehensive High School or an Area Vocational School or a Joint Vocational School District.

PROGRAMS TO BE OFFERED

TYPE I - Cooperative Training Program -- For Students of Average and Above Average Abilities

The program serves boys and girls grades 11 and 12. The training will include instruction in home economics and a supervised on-the-job work experience in the occupation for which the student is trained.

Suggested Cooperative Training Programs and Length of Training
(See Appendix A for Job Description)

(1) FOODS AREA
_____ Food Service and Catering Workers - 2 year program (11th-12th grades)
_____ Food Service Workers - 1 year program (12th grade)

(2) CHILD CARE AREA
_____ Child Care Assistants - 2 year program (11th-12th grades)
_____ Child Care Aides - 1 year program (12th grade)

(3) HOME MANAGEMENT AREA
_____ Homemaker's Assistants - 1 year program (12th grade)
_____ Nursing and Rest Home Aides - 1 year program (12th grade)

(4) CLOTHING AREA
_____ Clothing Service Workers - 2 year program (11th-12th grades)
_____ Clothing Service Aides - 1 year program (12th grade)

(5) Other programs may be developed as employment opportunities arise.

(6) A program directed toward employment may also be offered jointly with other vocational divisions.

TYPE II - Occupational Work Experience Program -- For Students of Limited Abilities

The occupational work experience program is to assist the student identified with limited ability to find a place in employment at the unskilled occupational level. The major objective is one of job placement combined with school work, both aimed at helping the student become a productive citizen and to continue his education as long as possible.

Suggested Occupations and Length of Training Programs
(See Appendix A for Job Description)

(Single Skill Performance)

(1) FOODS AREA
_____ Food Service Helpers - 2 year program (9-12 grades)

(2) HOME MANAGEMENT AREA
_____ Homemaker's Helpers - 2 year program (9-12 grades)
_____ Nursing and Rest Home Helpers - 2 year program (9-12 grades)

(3) CHILD CARE AREA
_____ Child Care Helpers - 2 year program (9-12 grades)

(4) Other programs may be developed as employment opportunities arise.

STUDENT ELIGIBILITY FOR THE TRAINING PROGRAM

The Students in the Cooperative Training Program Must:

- Be enrolled in high school in grade 11 and/or 12.
- Meet employment age requirements established by federal, state, and local laws for the occupation in which they are training.
- Have ability for and interest in the job for which training is offered.

One year of previous training in home economics is recommended at either the junior high or senior high school level.

The Students in the Occupational Work Experience Program Must:

- Be identified by a guidance counselor or teacher as not being qualified for the regular Cooperative Training Program.
- Be 2-4 years behind normal reading level.
- Meet age requirements established by federal, state, and local laws for which training is provided.
- Have interest in the job.
- Have ability for success in the training program.

One year of previous training in home economics is recommended at either the junior high or senior high school level.

TEACHER QUALIFICATIONS FOR JOB TRAINING PROGRAMS

General Qualifications

The teacher must:

- Meet state certification requirements in vocational home economics at the secondary level.
- Have proficiencies in the basic skills required in the specific occupation which is to be taught.
- Have had occupational experience
  - (a) as a paid worker (or) as a volunteer worker.
  - (b) in a supervised work project.

Special Qualifications

In addition to the above, teachers for Occupational Work Programs must have:

- 6-9 semester hours in special education and/or guidance courses or can secure a temporary certificate until courses are completed.
- A minimum of 2 years of teaching experience in either home economics education, special education, or in guidance or its equivalent.
- A minimum of 12 months of employment experiences (outside of public education) in one or more occupations.

Special Cases

A temporary certificate may be issued upon request of local school administrators to instructor for teaching job training classes to the following individuals:

- Professional home economists who are specialists in the subject matter area(s) involved.
- Persons who have had successful experience in an occupational field involved.
- Home economics teachers with a degree in home economics education.

Teachers employed on a temporary certificate to teach job training courses will be required to follow a planned pre-service and in-service program as recommended by the Head State Supervisor of Vocational Home Economics to meet the necessary certification requirements.

EQUIPMENT AND SPACE

In most instances, the regular high school home economics department equipped to teach all phases of homemaking will be adequate for the job oriented program. Additional equipment, storage, and teaching aids will be determined by the needs of the course(s) offered. (See Appendix A for Job Description.)

PROCEDURE FOR ESTABLISHING A JOB TRAINING PROGRAM

(1) Secure information concerning jobs in which there are opportunities for employment in the community.

This is essential as job training programs should be established only when studies indicate that there are opportunities for employment.

(2) Determine the number of potential students.

It is important to find out whether there is a sufficient number of potential students to justify the establishment of training program in the occupations which offer job opportunities.

(3) Establish a local advisory committee.

It is important that the following persons be represented:

The local school administrator, school board member, teachers to be involved, employer(s) in field for which workers are being trained, representatives of community agencies or groups allied with particular field(s) and other local people who could make special contributions. (Recommend that member of State Supervisory Staff in Home Economics Education serve as ex-officio member.)

(4) Select the occupations for which training programs will be developed.

The advisory committee assists the school administrator and teacher(s) in selecting the specific occupations for which training will be offered, and it assists the teacher(s) in planning the scope and emphasis of the training program so that it will meet the unique needs of the community.

(5) Identify the job(s) by title.

Example - Food Service Worker

(6) Analyze the job.

The job analysis is usually made by the State Employment Service, and the definition derived therefrom is found in the Dictionary of Occupational Titles.

(7) Prepare a job description.

A description is based on the job analysis and defines all major functions of the job and performance requirements. (See sample of Job Description in Appendix.)

(8) Determine qualifications of trainees as a basis for selection.

For minimum qualifications see job descriptions in Appendix A.

Other desirable qualifications may be considered as requirements in the selection of trainees.

(9) Plan the program.

Contact the Vocational Division of Home Economics, State Department of Education for application forms and curriculum materials.

(10) Locate possible work experience stations and select those in which trainees will be placed for work experience.

(11) Identify qualifications of teachers.

- Personal qualities
- Professional preparation
- Teaching experiences
- Work experience

(12) Determine facilities and equipment needed.
(See Appendix A for Job Description)

(13) Secure cooperation of other departments in the school.

(14) Assist in job placement and follow-up of trainees.

Both the teacher and the advisory committee assist in job placement. The school also keeps records on placement and evaluate job success.

ADMINISTRATION AND SUPERVISION OF THE PROGRAM

Program Coordinator

The person employed to teach in either the cooperative training program (for students of average and above ability) or the occupational work experience program (for students of limited abilities) shall be known as a coordinator. In addition to teaching the class, the coordinator is responsible for (1) assisting with the selection of students for the program, (2) identifying work stations for students, (3) placing students on jobs, and (4) supervising and evaluating the student work with employer during the work experience phase of the program.

Employment of Teacher

Employment of the teacher for a period of either (4, 8, or 12 weeks) beyond the school year is necessary to establish, instruct, and evaluate the work experience programs. The length of the employment is established at local level.

Travel Funds

Travel funds are allowed during the regular school year and the time of extended employment for supervising work experiences and attending approved conferences and meetings.

Teacher's Schedule

The teacher's schedule must include time to supervise the work experience of trainees as well as the time required for class instruction.

Attendance of the teacher at in-service conferences, workshops, and meetings related to job training called by the Division of Vocational Home Economics, State Department of Education, is considered part of the program and is recommended.

Student Visitations

It is recommended that the teacher plan in her schedule to visit the business establishment where each student in the job training program has been placed once every two weeks.

Size of Classes

The number of students assigned to any one job training class shall be not less than eight and should not exceed thirty. (See Appendix B for Criteria for unit approval.)

Student Schedule

A student shall spend a minimum of 15 clock hours each week or a comparable alternating week(s) plan in employment for wages in the occupation for which he or she is training.

Each student shall spend a minimum of one-half day in school devoted to class instruction related to the occupation for which he or she is training and also for subjects meeting graduation requirements.

A minimum block of two 45 minute periods or one 60 minute period of time daily shall be devoted to class instruction related to the occupation in a 1 year program. One period (either 45 or 60 minutes) is required for a 2 year program.

Evaluation

Continuous evaluation is to be carried on and used as a basis for maintaining an effective program. Evaluation shall be concerned with appraising the total growth of the student and his success on the job. The State Supervisory Staff, teachers, administrators, and employers shall plan and carry out an evaluation of the program and make recommendations for improvement.

FHA

A student enrolled in a job training program may be a member of the Future Homemakers of America Association.

The Future Homemakers of America is recommended as an integral part of the total Vocational Home Economics program. The organization and supervision of the activities of the Future Homemakers of America may be a responsibility of the teacher employed for the work experience program.

APPENDIX A

Suggested Use of Job Description Materials

Specific suggestions are given for the two different programs:

(1) Cooperative training

(2) Occupational work experience

Teachers will need to adjust and adapt the job description to the needs of the particular group they are teaching. This is important because the duties expected in service occupations may differ from community to community and the trainees will vary in education, experience, and ability.

In addition to having first-hand information concerning job requirements, the individual teacher must secure as much information as possible about the trainees from the testing service of the Guidance Staff in the school or from the Employment Office.

The specific objectives, teaching methods, and time alloted to each aspect of the training can then be adjusted to the local situation and to the trainees.

COOPERATIVE TRAINING PROGRAM FOR CHILD CARE WORKERS

CHILD CARE AIDE (ONE YEAR)

Job Description

The child care aide will assist the director of the nursery school or a child care center working under her supervision. Her dutues will include helping the director carry out the activities of the nursery school or child care center.

Employment Opportunities

Child care center worker
Private and community nursery school aide
Aide to private kindergarten teacher
Self-employment in a home, caring for children

Characteristics of Trainees

Good personal habits in speech and mannerisms
Cooperative, courteous, friendly, and tactful in dealing with people
Works effectively under supervision
Free from non-communicable diseases
Sound physical and mental health

CHILD CARE ASSISTANT (TWO YEAR)

Job Description

The child care assistant upon completion of the two year program will be able to accept the position of assistant director of a nursery school or a child care center. Students will become skilled in caring for the needs of pre-school age children and in carrying out a planned program of work in either a nursery school or child care center.

Employment Opportunities

Child care center workers
Private and community nursery school assistant
Private kindergarten assistant
Recreation center aide
Self-employment in home, caring for children
Assistant in children's home
Assistant in pediatric ward in hospital

Characteristics of Trainees

Good personal habits in speech and mannerisms
Cooperative, courteous, friendly, and tactful in dealing with people
Ability to make decisions
Works effectively under supervision
Free from non-communicable diseases
Sound physical and mental health

Program Outline for Child Care Aides (one year program)

(1) Job Orientation

Credentials and regulations
Qualities for job success
Opportunities for employment
Applications and interviews
Analysis of the job

(2) Becoming oriented to the nursery school.

(3) Understanding the needs of young children.

(4) Understanding characteristics of young children.

(5) Keeping the child healthy.

(6) Helping children develop good habits.

(7) Preparation of foods for young children.

(8) Directing play and learning activities.

(9) Sanitation practices and housekeeping duties.

Program Outline for Child Care Assistant (Two Year Program)

In addition to the content for the one year program the following topics should be included:

(1) Understanding and management of children in child care centers.

(2) Guidance techniques for child care centers.

(3) Management of the children's day.

(4) Planning and preparing menus for children in child care centers.

(5) Relationships with parents.

(6) Management techniques in the operation of a nursery school or child care center.

Teaching Facilities

The instructional situation for a day care center or nursery school should provide opportunity for the trainee to have experience working with children. In many cases, the school or home economics department may have the necessary space.

The following facilities are needed:

- Indoor and outdoor play equipment.
- Play material and furnishings of sufficient quantity and quality and variety so that each child has a variety of things to do each day.
- Play equipment must be directly related to the developmental needs of the children and to the total number of children in attendance.

OCCUPATIONAL WORK EXPERIENCE TRAINING PROGRAM

CHILD CARE WORKER

The instruction will be mainly work activity, providing trainees with repetitive experiences with children. The only responsibility given to trainees will be helping or assisting with the care of children in nursery school or child care center.

Employment Opportunities

Child care center or nursery school helper
Helper in retarded children's home
Private nursery school or kindergarten helper

Training Program Outline for Child Care Helper (Two Year Program)

(1) Job Orientation

Credentials and regulations
Qualities for job success
Opportunities for employment
Application and interviews
Analysis of the job

(2) Purpose and function of child care center.

(3) Assisting children remove garments and put them in designated places.

(4) Helping children in routine activities as eating, resting, and toileting.

(5) Arranging facilities and equipment in the center for various types of play activities.

(6) Help children develop habit of caring for own clothing, and picking up and putting away toys and books.

(7) Preparation of simple foods for children.

(8) Helping keep the day care center clean and attractive.

(9) Practicing accident prevention.

COOPERATIVE TRAINING PROGRAM

HOMEMAKER'S ASSISTANT

A person trained as a homemaker's assistant will be employed to work either in a home or an institution (hospital, nursing home, child care center) under the direction of a homemaker if employed in a home or a housekeeping supervisor if employed in an institution.

Employment Opportunities

Full-time or part-time in private home
Housekeeping aide in a nursing or rest home
Hospital housekeeping aide
Hotel and motel housekeeping aide

Characteristics of Trainees

Sound physical and mental health
Neat personal appearance
Ability to follow both oral and written directions
Ability to work with people

Program Outline for Homemaker's Assistant

(1) Job Orientation

Credentials and regulations
Qualities for job success
Opportunities for employment
Application and interviews
Analysis of the job

(2) Desirable characteristics of workers.

(3) Methods of performing essential household tasks.

(4) Development of skills in the performance of household tasks.

(5) Management principles in the use of time and energy.

(6) Personal and social relationships.

(7) Guidance of children when mother is away from home.

(8) Use of family resources in providing for:

- Care of children
- Family meals
- Medical services
- Clothing
- Safety
- Emergencies in the home

(9) Preparation and service of food.

(10) Laundering.

Teaching Facilities

The facilities provided for teaching home economics in the established high school may be used. A large flexible room is desirable. In addition, there should be a large walk-in storage room. A portable wall to divide the room will increase the possibility of full utilization of space. Teaching aides and supplies should include illustrative materials to teach.

OCCUPATIONAL WORK EXPERIENCE PROGRAM (TWO YEAR PROGRAM)

HOMEMAKER'S ASSISTANT

Employment Opportunities

Laundress
Maids in institutions such as hotels, rest homes, day care centers
Dishwashers
Dining room assistants
Janitress
Helpers in the home

Repetitive experience is needed in performing simple tasks in housekeeping and the operation of the home. The topics listed for instruction in the work experience program will comprise the contents for the cooperative work experience program and will be geared to the ability level of the student. The program will be developed over a two year period.

COOPERATIVE TRAINING PROGRAM FOR NURSING AND REST HOME AIDE (ONE YEAR PROGRAM)

NURSING AND REST HOME AIDE

Job Description

The trainee will be qualified to work in a private home or in a public institution assisting with the housekeeping responsibilities of the home and with the physical care of older persons.

Employment Opportunities

Nursing home aide
Rest home aide
Private home aide for elderly person(s)
Companion to an elderly person(s)

Characteristics of Trainees

Sound physical and mental health
Neat personal appearance
Follows both oral and written directions
Good character, patience, and interest in people

Training Program Outline for Nursing and Rest Home Aide (One Year Program)

(1) Job Orientation

Credentials and regulations
Qualities for job success
Opportunities for employment
Applications and interviews
Analysis of the job

(2) Desirable characteristics of a home nurse.

(3) An understanding and appreciation of the attitudes and behavior of aging individuals.

(4) Techniques in caring for the sick.

(5) Planning and preparing of menus including special diets.

(6) Sanitation and housekeeping practices.

(7) Effective management practices in caring for the room and the laundry.

(8) Meeting emergencies.

(9) State and local regulations for public institutions caring for the aged.

Teaching Facilities

In addition to the home economics department with modern equipment and furnishings to teach homemaking, there are various types of public and private facilities which, if available, could be used to enhance the effectiveness of the course.

The following facilities may be utilized:

- Rest homes and nursing homes to observe techniques used in carrying for older people, home management practices, and meal preparation.
- Hospitals, rehabilitation centers, and housing developments for the aging.
- Food stores, banks, and libraries.
- The Red Cross unit may assist in providing some of the equipment needed to teach home care of the sick.

OCCUPATIONAL WORK EXPERIENCE PROGRAM FOR NURSING AND REST HOME HELPER (TWO YEAR PROGRAM)

NURSING AND REST HOME HELPERS

The instruction must be geared to the ability level of the student and the curriculum be chiefly centered on work activity. The topics to be included in the curriculum will be the same as those identified for the cooperative work experience program above and will be developed over a two year period.

Employment Opportunities

Dishwashing
Aide to housekeeper
Carrying trays and feeding patients

COOPERATIVE TRAINING PROGRAMS FOR FOOD SERVICE WORKER

(ONE OR TWO YEAR PROGRAM)

FOOD SERVICE WORKER

Job Description

A person who works under supervision in the preparation of food. Upon completion of the training, the trainee will be qualified for a job in food service in institutions such as hospitals, nursing homes, homes for the aged, child day care centers, school cafeterias, restaurants, and other eating establishments.

Job Opportunities

Completion of one year training program -

- Assistant to cook in large institutions
- Cook or baker doing basic food preparation
- Worker in setting up hot food table and serving food
- Worker in preparing trays and serving food
- Worker in filling food containers and sending food to the diet kitchen
- Salad girl, cafeteria server

Completion of two year training program -

- Head cook in small institution kitchen
- Assistant to the supervisor
- Ordering food
- Planning menus
- Cook or baker doing food preparation
- Food preparation
- Dietary aide in hospital

Characteristics of Trainee

- Have manual dexterity
- Be of sound physical and mental health
- Have a physical examination
- Be able to follow both oral and written directions

Program Outline for Food Service Workers (One Year)

(1) Job Orientation

- Credentials and regulations
- Qualities for job success
- Opportunities for employment
- Applications and interviews
- Analysis of the job

(2) Essential hygiene and health practices.

(3) Nutritional quality of food.

(4) Safety requirements.

(5) Safe food handling.

(6) Sanitation and housekeeping practices.

(7) Care and use of equipment.

(8) Adequate and proper storage of food.

(9) Basic skills in preparation of foods.

(10) Basic skills in service of foods.

(11) Organization of work in relation to space and time limitations.

Program Outline For Food Service and Catering Workers (Two Year Program)

In addition to the content for the one year program the following topics should be included:

(1) Principles of time and energy management. (Time and work study charts.)

(2) Food purchasing. (On an institutuional basis.)

(3) Food cost estimates.

(4) Menu planning.

(5) Increased skill in the preparation of food on a quantity basis.

(6) Increased skill in the service of food.

(7) Interviewing techniques of employees.

Teaching Facilities

The teaching situation should provide opportunity for the trainee to have repetitive experiences in the preparation and serving of hot food.

In addition to the facilities provided in the regular homemaking department, the following facilities are needed:

- Large quantity food equipment to make large quantity food preparations. (School cafeteria may be utilized.)
- Sufficient work stations and supplies for repetitive experiences.
- Texts, visual aids, and resource books.
- Opportunities for observation of actual institutional facilities in use.

OCCUPATIONAL WORK EXPERIENCE TRAINING PROGRAM (TWO YEAR PROGRAM)

FOOD SERVICE HELPERS

The training program in food service may be a part of the total occupational work experience in home economics. The instruction will be geared to the ability level of the student and will be focused on a work activity program. Operation skills must be kept as a single skill level and repetitive performance if necessary.

Employment Opportunities

Bus girl
Dishwasher
Pot washer
Cook's helper (simple food preparation)
Simple preparation worker
Janitress
Pantry service sandwich worker
Pantry service dessert worker
Steam table worker

Program Outline in Food Service for the Occupational Work Experience Program (Two Year Program)

(1) Job Orientation

Credentials and regulations
Qualities for job success
Opportunities for employment
Application and interviews
Analysis of the job

(2) Essential hygiene and health practices.

(3) Safety requirements.

(4) Safe food handling.

(5) Sanitation and housekeeping practices.

(6) Adequate storage of food.

(7) Single operation skills in preparation of foods.

(8) Single operation skills in serving food.

(9) Simple organization of work.

COOPERATIVE TRAINING PROGRAM FOR CLOTHING SERVICE WORKER

(ONE OR TWO YEAR PROGRAM)

Job Description

The clothing service worker upon completion of the two year program shall be able to work with a dressmaker helping with fitting, alteration, construction, and finishing of garments. Trainees may also work in shops with persons making draperies and slipcovers. This training will also provide for work with an upholsterer in recommending fabrics for different styles of furniture as well as assisting with the upholstering processes.

Employment Opportunities for Clothing Service Workers

Dressmaker assistant
Fitter or seamstress in a dress department or store
Dressmaker (self employed)
Assistant to a drapery or curtain seamstress
Assistant to a slip cover seamstress
Drapery or slip cover seamstress (self employed)
Upholstery seamstress (self employed)
Coin operated dry cleaning worker

Characteristics of Trainees

Interest in sewing
Ability to learn to manipulate pattern and fabrics effectively
Mechanical dexterity to manipulate machines and tools of the trade

Program Outline for Clothing Service Worker (One Year Program)

(1) Job orientation

Credentials
Qualities for job success
Opportunities for employment
Applications and interviews
Analysis of the job

(2) Use of patterns and guide sheets.

(3) Alteration and fitting problems.

(4) Machine construction processes.

(5) Hand sewing.

(6) Selection.

(7) Spotting of stains.

(8) Pressing.

COOPERATIVE TRAINING PROGRAM OUTLINE FOR CLOTHING SERVICE WORKER

(TWO YEAR PROGRAM)

In addition to the content for the one year program, the following topics should be included:

(1) Slip cover construction processes - fitting, cutting, assembling.

(2) Drapery and curtain making techniques.

(3) Upholstery techniques.

(4) Styles of furniture and fabrics suitable.

(5) Business management techniques.

Teaching Facilities

A suggested teaching facility is a well equipped clothing laboratory with sewing machines, pressing boards, laundry facilities as well as upholstery tools and materials. It is recommended that planned visits to dressmakers, upholstering shops, department stores, and dry cleaning establishments be included in the course.

APPENDIX B

Criteria for Approval of Vocational Unit(s) in Home Economics Job Training Programs

One unit of approval will be given when one teacher is employed, when all class periods of the one teacher are devoted to the occupational work experience program utilizing home economics knowledge and skills for the students of limited ability, and when the enrollment is 15 - 30 students.

One half unit of approval will be given when one teacher is employed and devotes one half day to the occupational work experience program and when the enrollment is 8 - 14 students.

One unit of approval will be given when one teacher is employed, when all class periods of the one teacher are devoted to the cooperative training program utilizing home economics knowledge and skills, and when the enrollment is 15 - 30 students.

One half unit of approval will be given when one teacher is employed and devotes one half day to the cooperative training program utilizing home economics knowledge and skills and when the enrollment is 8 - 14 students.

Whenever less than full time or less than half time is devoted to the occupational work experience program or the cooperative training program utilizing home economics knowledge and skills, the approved vocational unit or the fraction thereof will be reduced a corresponding amount.

Number of Units or Fractions of Units Approved in Cooperative Training or Occupational Work Experience Programs Utilizing Home Economics Knowledge and Skills According to Enrollment of Students in the Programs and Number of Periods Devoted to the Program

SECT	Periods Devoted to Cooperative Training of Occupational Work Experience Programs Based on Total Periods in the Day.		Enrollment of Students in Occupations or Cooperative Programs

Vocational Home Economics - Room G-15
State Department of Education
State Office Building
65 South Front Street
Columbus, Ohio 43215

SUBJECT: ESTABLISHING PROGRAMS IN HIGH SCHOOL IN JOB TRAINING FOR OCCUPATIONS USING HOME ECONOMICS KNOWLEDGE AND SKILLS

(1) The purpose of vocational education in home economics which is directed toward gainful employment provides instruction that qualifies individuals to engage in occupations using home economics knowledge and skills.

(2) Some Criteria for Determining Approval of Vocational Units and Fractional Units in high school job training in home economics.

Approval of Vocational Units under the School Foundation Program shall be based on the following:

- Availability of sufficient number of students who are interested in and who have aptitude for training for specific occupations.
- Evidence of opportunities for employment in occupations for which training programs are proposed.
- Teachers who are qualified or who can become qualified.
- Work station experience can be provided for trainees.
- Reasonable opportunities for placement of trainees after completion of training.
- Proposed plan for needed facilities can be justified on the basis of continued use.
- School and community are able and willing to support the program.
- Students meet legal age employment laws (local, state, and federal).

(3) TYPES OF JOB TRAINING PROGRAMS - Vocational Home Economics

The following information and data supplies evidence for supporting such a job training program in our Vocational Home Economics school in the program selected by our school.

TYPE I - Cooperative training program
A program for students of average or above average ability.

TYPE II - Occupational work experience program
A program for students of limited ability.

PRELIMINARY APPLICATION AND INFORMATION DATE FOR APPROVAL FOR A HIGH SCHOOL JOB TRAINING PROGRAM IN VOCATIONAL HOME ECONOMICS

Acting on behalf of the _____ Board of Education, I hereby apply for approval to initiate a program of Vocational Home Economics Education as a vocational unit(s) under the Ohio Foundation Program. The following information has been obtained to justify consideration of the program in the above named school.

Signed _____

Title _____

School _____ County _____ Date _____

Mailing Address _____

Number in High School _____ (Girls - _____) (Boys - _____)

Type of High School -

Senior High _____ (Grades 10 - 12) _____ (Grades 9 - 12)

Junior High _____ (Grades 7 - 9) _____ (Grades 7 & 8)

Complete the following form in duplicate and return to:

Miss Margaret McEniry
Head State Supervisor
State Department of Education
Division of Vocational Education
Vocational Home Economics
State Office Building
65 South Front Street
Columbus, Ohio 43215

This data supplies evidence for offering a job training program in your school.

TYPE I -- COOPERATIVE TRAINING PROGRAM - Check below the program you selected
(Program for Students of Average and Above Average Ability)

(1) FOODS AREA

____ Food Service and Catering Workers - 2 year program (11th and 12th)
____ Food Service Workers - 1 year program (12th)

(2) CHILD CARE AREA

____ Child Care Assistants - 2 year program (11th and 12th)
____ Child Care Aides - 1 year program (12th)

(3) HOME MANAGEMENT

____ Homemaker's Assistants - 1 year program (12th)
____ Nursing and Rest Home Aides - 1 year program (12th)

(4) CLOTHING AREA

____ Clothing Service Workers - 2 year program (11th and 12th)

SUPPLY THE FOLLOWING INFORMATION ABOUT COOPERATIVE TRAINING PROGRAM
(For Students of Average and Above Average Ability)

(A) Teachers for the Program

Name of Teacher _____

Qualifications

____ holds a Vocational Home Economics Certificate
____ can qualify for Vocational Home Economics Certificate by attending summer school

Has had the following Occupational Work Experience

____ as a paid worker in the field of _____
____ as a volunteer worker in the field of _____
____ as a supervisor in the field of _____

(B) Students

____ meet legal employment laws (local, state, and federal)
____ have approval of parents to do work experience for one half day and can secure work permit
____ will be employed at work stations for an average of fifteen hours per week or on a comparable alternating week(s) plan
____ are of average or above average ability

(C) Schedule

____ allows for one half day of field work experience
____ allows for one half day in school for instruction in the occupational class experience and other required high school courses
____ allows two (45 minute) instructional periods daily for 1 year program
____ allows one (60 minute) instructional period daily for two year program

(D) Work Stations

____ have been agreed upon by _____ employees.
(number)

TYPE II -- OCCUPATIONAL WORK EXPERIENCE PROGRAM - Check the program you selected
(Program for Students of Limited Ability) - Single skill, unskilled

(1) FOODS AREA

_____ Food Service Helpers - 2 year program (9th - 12th)

(2) HOME NURSING

_____ Nursing Home Helpers - 2 year program (9th - 12th)

(3) HOME MANAGEMENT

_____ Homemaker's Helpers - 2 year program (9th - 12th)

(4) CHILD CARE AREA

_____ Child Care Helpers - 2 year program (9th - 12th)

INFORMATION NEEDED ABOUT OCCUPATIONAL WORK EXPERIENCE PROGRAM
(For Students of Limited Ability)

(A) Teachers for the Program

Name of the teacher _____

Qualifications

_____ holds a Vocational Home Economics Certificate
_____ can qualify for a Vocational Home Economics Certificate by attending summer school

Has had occupational work experience

_____ as a paid worker in the field of _____
_____ as a volunteer worker in the field of _____
_____ as a supervisor in the field of _____
_____ has six to nine semester hours in special education and/or guidance courses, or secure a temporary vocational certificate until hours are earned
_____ has minimum of two years of teaching experience in either home economics education, special education, or in guidance or its equivalent

(B) Students

_____ meet legal employment laws (local, state, and federal)
_____ have parents approval to do work experience and can secure work permit
_____ will be employed on their job stations for an average of fifteen hours per week or a comparable alternating week(s) plan
_____ are of limited ability (75 to 89 I.Q.)
_____ be identified by a guidance counselor or teacher as not being qualified for the regular Cooperative Work Experience Program
_____ have ability for success in the training program

(C) Schedule

_____ schedule allows for one half day for field work experience
_____ schedule allows for one half day in school; includes instruction for the occupational work experience program as follows:
_____ two (45") instructional period daily (Two year program)
_____ one (60") instructional period daily

(D) Work Stations

_____ have been agreed upon by _____ employees
(number)

THIS PAGE TO BE COMPLETED FOR TYPE I AND/OR TYPE II PROGRAMS

I. Indicate provisions for administration of program

____ Exact number of students enrolled for the program

1 Unit (15 - 30 Students)
½ Unit (8 - 14 Students)

____ Teacher's Travel Budget allowed to coordinate program
(75% reimbursed up to $300 from State)

Teacher employed beyond the regular school year

____ 4 weeks
____ 8 weeks
____ 12 weeks

II. Describe plans for providing space, equipment, and maintenance of physical plant facilities for the program.

III. Outline of course and content for this course is attached

Supervising Occupational Experience Programs. (A Special Conference Report, Resident Instruction Series, no. 7).

Davis, Lowery H., Ed.

New Mexico State Univ., University Park

Feb66

EDRS Price MF-$0.18 HC-$2.68 67p.

STUDENT PLACEMENT, ADMISSION CRITERIA, *COOPERATIVE EDUCATION, COMMUNITY SURVEYS, ADVISORY COMMITTEES, PUBLIC RELATIONS, *PROGRAM GUIDES, *PROGRAM PLANNING, PROGRAM EVALUATION, VOCATIONAL FOLLOWUP, QUESTIONNAIRES, EMPLOYERS, COMMUNITY RELATIONS, *VOCATIONAL EDUCATION, WORKSHOPS,

Nine participants in a workshop at New Mexico State University developed this 4-part handbook for operating supervised occupational experience programs. Resource persons from adult education, agricultural education, vocational and technical education, and horticulture worked closely with the group. Part one covers steps for organizing and administering the occupational experience program, and elaborates on the role of community surveys and advisory councils. Part two gives details of selecting and placing students in the occupational work experience program. Part three explains the teaching, supervising, and coordinating of occupational experience programs. Part four presents guidelines for evaluating the program. The appendix contains an employment opportunities survey form, student information sheet, and a placement agreement. (EM)

- FOREWORD -

New Mexico State University was especially fortunate to have Dr. Lowery H. Davis, Head of the Department of Agricultural Education at Clemson University, to conduct a workshop on supervising occupational experience programs. The results of the workshop published in this report will be most helpful at a time when program challenges are being focused toward experience programs.

The Department of Agricultural & Extension Education appreciates the leadership which Dr. Davis gave to directing the conference and the editing of the final report.

APPRECIATION

Appreciation is expressed to the Consultants who worked closely with the group during the workshop. There was no attempt to have formal presentations from the resource personnel. Rather, they worked informally with the group. Therefore, their ideas are found incorporated throughout the report.

ORGANIZING AND ADMINISTERING

THE OCCUPATIONAL EXPERIENCE PROGRAM

Committee I

Jack M. Parker

Bloomfield, New Mexico

Ronald A. King

Amarillo, Texas

Organizing and Administering the Occupational Experience Program

Occupational Experience Programs

Occupational experience programs are designed to provide supervised experiences for gainful employment. Students are given classroom instruction in various occupations and then have the opportunity to further their education while on the job. This program is accomplished by establishing a cooperative arrangement between the school and the businesses and industries in the community. This enables students who are in the 11th and 12th grades to receive occupational experience while completing the requirements for a high school diploma. The student spends a predetermined number of hours during the year working in the occupational experience center. These hours may or may not occur during the regular school day. The training received at the occupational experience center is under the direction of an instructor selected from the firm or business in which the student is working. The teacher has the responsibility for providing the related instruction and coordinating the program.

In organizing an occupational experience program, the teacher should meet with the school administrators to discuss the program and agree on the steps to follow in developing a new program. These steps are not necessarily in the order to be accomplished.

1. The appropriate State Supervisor of Vocational Education should meet with local officials to explain state policies and standards.

2. A local advisory council should be appointed.
3. The public should be informed.
4. A survey should be made of local businesses that are related to the desired occupational experiences.
5. A survey of the student body should be made to determine the number of prospective students.
6. The school should develop local policies for directing the occupational experience program.
7. Obtain the necessary equipment and facilities.
8. Select students and occupational experience centers.
9. Develop occupational experience plans and complete necessary forms and certificates.
10. Obtain all instructional material needed.

The Community Survey

The purpose of a Community Survey of Occupations is to provide information for occupational guidance and for planning new programs.

The primary intent of the survey is to analyze the segment of our economy not now adequately served by vocational and technical education, and about which sufficient knowledge for program development is not available.

Specific Objectives of the Community Survey[1]

1. To identify present and emerging occupations, for which

---

[1] A Study to Determine Employment Opportunities and Needed Competencies in Agricultural Occupations Other Than Farming, University Park, Pennsylvania, Department of Agricultural Education, Pennsylvania State University.

occupational experience programs should be available.

2. To determine present and anticipated numbers of employees in these occupations and their job titles.
3. To estimate the annual turnover and entry opportunities in these occupations and job titles.
4. To determine competencies needed for entry and advancement in these occupations.
5. To determine other characteristics of the occupations such as salary, minimum age of entry, labor laws and union restrictions, required formal education and experience, licensing and certification.
6. To determine continuing education needs of those employed in these occupations.
7. To structure course outlines and curricula.

The community survey may be used to indicate movement of the student population. Do they remain in the community after graduation or move to another area to accept different occupations? These answers will be important in developing the needed areas of occupations.

The survey form[2] shown in Appendix 1 was developed at Pennsylvania State University for use in determining employment opportunities in agricultural occupations. This survey may be used as a guide for other occupational experience programs.

---

[2]Ibid., pp. 6-9.

The Advisory Council

The advisory council is a lay committee which assists in the planning, execution, and evaluation of the occupational experience program. To qualify as a member of the advisory council a person should experess an interest in the problems of the school. The membership should be represented by a respected leader in the business field, and represent a cross-section of those affected by the program. Not all advisory committee members need to come from a school attendance area. The teacher and a member of the administrative staff should serve as ex-officio members of the council.

The advisory council may aid in public relations, provide a closer tie between the community and school, provide a clearer image of community problems and needs, and present to the community the expected goals of the occupational experience program.

The advisory council should be initially appointed for different terms so experienced members will be on the council at all times. This council should consist of five or more members. The advisory council members should be appointed or elected by the local school board. The council should serve a definite term of office.

Function of an Advisory Council[3]

1. Assist in the selection of training centers.
2. Renders service in developing employment opportunities.
3. Assists in setting standards for student selection.
4. Provides guidance in wage and hour problems.

---

[3]Marvin G. Linson and Harold Anderson (ed.), Handbook for Developing and Operating Agricultural Occupations, Fort Collins, Colorado, Vocational Education Department, Colorado State University, p. 10.

5. Helps publicize the program.
6. Gives advice on the selection of references and other instructional aids.
7. Assists in setting local training standards.
8. Renders assistance in conducting the community survey.
9. Assists in the selection of subjects, course content, and special emphasis that should be included in the occupational experience program.
10. Assist in evaluating the occupational experience program.

Local Policies

It is difficult to suggest specific policies which would be suitable for every situation. Local policies being basically essential in any program for proper administration require their use. The following policy guides are suggested for the local school board and teachers of the occupational experience program to consider when establishing local policies.

A. School Board Policies
   1. Insurance
      a. Accident insurance
      b. General liability insurance
      c. Workman's compensation insurance
   2. Transportation
   3. Course schedule for participating students
   4. Scheduling occupational experience program
   5. Providing for supervisor time and travel allowance

6. Eligibility of students
7. Approval of areas of occupational experience to offer

B. Departmental Policies
1. Number of students in class
2. Evaluating students (grades)
3. Standards for occupational experience centers
   a. Suitability for student participation
   b. Health and safety
   c. Progressive learning opportunities
   d. Wages received by students

Informing the Public

The best publicity for an occupational experience program is a successful program. However, success of failure of any program is often dependent upon the publicity it receives. If the public has a good understanding of the aims and objectives of the occupational experience program, the chances are that the program will be easier to organize and supervise.

There are numerous methods of introducing the program to the community. It is advisable to use a combination of the communication outlets rather than just one or two. It is also important to keep the program in the news at all times.

The teacher should become acquainted with the newspaper editor and the radio and television personnel in the community. These mass media services provide an excellent means of introducing the program to the community.

The school teaching staff, student body, and the Parent-Teachers Association should be informed of the occupational experience program. If the people who are closely associated with the school have a clear understanding of the value of the program, their approval and support may be obtained.

The Chamber of Commerce, civic clubs, and other groups provide excellent opportunities for acquainting the businessmen of the community with the program. It would be desirable to contact these organizations before conducting a community survey so that the businessmen will have some knowledge of the program when contacted by the interviewer.

When the teacher is visiting prospective occupational experience centers, he should have a calling card with his name, office telephone number, home telephone number, and the name of local high school. A brochure that briefly explains the occupational experience program should be left with the prospective employers to give him a better understanding of the program.

As the program develops, the teacher should accumulate an album of pictures of local students receiving education in the occupational experience center. These pictures will be useful in securing new experience centers and will also be valuable in newspaper publicity.

A final reminder - the best publicity for an occupational experience program is a successful program.

Public Relations

The occupational experience program requires the teacher

to work closely with employers and the student's supervisors. The cooperation of employers is mandatory to provide occupational experience for the students and future permanent employment.

The teacher should strive to gain the cooperation of organized labor. The teacher should learn the requirements for admission and the possibilities of substituting occupational experience for part of apprenticeship requirements.

The teacher should gain valuable assistance by cooperating with the Employment Security Commission. The Employment Security Commission may assist in finding part-time occupational experience centers, securing full-time employment for graduates, and could assist in recruiting and testing prospective students.

Governmental agencies are very important due to the large number of employees maintained. The cooperation and backing of these agencies may yield excellent placement opportunities for occupational experience program graduates.

In school, the cooperation of other teachers is highly desirable. Through mutual cooperation the occupational experiences may be expanded, the training in the active occupational experience areas may be intensified, and the experience program may even reach a team teaching situation.

SELECTING AND PLACING STUDENTS IN THE OCCUPATIONAL WORK EXPERIENCE PROGRAMS

Committee II

Stanley H. Lewis, Chairman

Estancia, New Mexico

Ethel Jane Strode

Alamogordo, New Mexico

Francisco Rodriguez

San Jose, Costa Rica

Selection of Occupational Experience Centers

The selection of adequate training centers is an important key to successful training. The following steps are listed as a guide in the selection of training centers.

1. Compile a list of all possible training centers, utilizing:
   a. Yellow pages of telephone directory
   b. City directory
   c. Chamber of Commerce
   d. Records on file of previous training stations
   e. Employment Commission
   f. Leads through:
      (1) Civic organizations
      (2) Advisory committee members
      (3) Counselors and other school personnel
      (4) Other business people
      (5) Trade Associations
      (6) Professional organizations
   g. Door to door contact.
2. Have the superintendent send out a letter, introducing the program and the teacher of occupational work experience, to the prospective employer.
3. Arrange for an interview in each firm which might serve as a training center. This would be a follow-up to step 2.
4. Use the following criteria in selecting training centers:
   a. The training center must provide a suitable occupation.

b. The job should require training, not be just a routine work experience of a repetitive nature.

c. The training center should be able to provide a wide variety of work experiences in the occupation, with a progression of difficulty or skill needed. There should be possibility for advancement within the establishment.

d. The establishment should provide the student with adequate supervision by an on-the-job instructor--this does not necessarily mean the manager.

e. The employer and his personnel should understand and appreciate the importance of the occupational work experience program.

f. The training center personnel should be capable and willing to provide adequate number of training hours and be willing to provide continuous training.

g. The employer should be willing to pay the student.

h. The employer should be willing to help plan the course of study for the student.

i. The employer should be willing to provide reports on attendance, evaluation of work done, the personality development of the student--such as: attitude, judgment, initiative, cooperation, etc.

j. The employer should be willing to work with the advisory council and perhaps serve on it if requested to do so.

k. The training center should do a reasonable volume of business.

l. The training center should be within a reasonable traveling time from the school--a suggestion of approximately 30 minutes might be made.

m. The training center should have a good reputation and be accepted by the community as a reliable respected business establishment.

n. The working conditions should be clean, safe and satisfactory.

o. The moral climate should be good and employer-employee relations good.

p. The training center should have adequate facilities and equipment and use up-to-date methods.

Selection of Students

Much of the success of occupational experience programs depends upon the motivation of the students enrolled. Students of a high calibre are important. This does not necessarily mean those in the upper quartile, but refers to those students who possess the aptitude and motivation required for success in a given occupation. The objectives of a program of this type can only be attained when the student is capable and desirous of receiving training. There is a tendency among some educators to gear a program of this type toward students with low academic and leadership ability. Education in many occupations requires students with desirable personal traits and above average aptitudes.

The following steps are suggested as a guide to follow in selecting desirable students.

1. Get information on the program to the students through personal contact with student leaders who will "spread the word" about your program.
2. Make a general announcement concerning the program to all eligible students at least two months before the pre-registration for the next school year.
3. Have all interested students fill out an "Application for Enrollment" form. See example at the end of this section.
4. Make arrangements with the school counselor to obtain various test scores and other confidential information which will not be reported on the "Application--" form. Record this information on the teacher's copy ONLY of the "Student Information Sheet."
5. Request the permission and cooperation of the administration and guidance personnel in the administering and interpreting of all the vocational interest tests possible, such as Kuder and Strong.
6. Review the "Student Information Sheets" to determine those students who meet the minimum qualifications.
7. Before a final selection is made, each student should be interviewed personally. This will help obtain information that has not been listed elsewhere.
8. After completing the preceding steps, sufficient information should be available to make the final selection of students. The following criteria should be kept in mind when selecting students. Select students who:
   a. Have an occupational objective.

b. Have shown that they possess ability and willingness to work.

c. Possess the ability to assume responsibility when necessary.

d. Possess basic knowledge and interest in the subject matter in the training area.

e. Have parents approval of their participation in the program.

f. Will be at least 16 years old when the on-the-job experience period begins.

g. Have maintained good school attendance records.

h. Will be able to work the minimum required hours per week.

i. Will be able to get to and from the training centers.

j. Do not possess any handicap which would impair them in the performance of their duties on the job.

k. Can secure a health permit to work when it is required at the training center.

l. Have recommendations of his other teachers or the recommendation of the principal.

The Student Information Sheet for Vocational Occupations Courses (see Appendix 2) would be filled out by the student and signed by the parent, then returned to the teacher.

The teacher could then prepare a typewritten copy in duplicate of the Student Information Sheet for Vocational Occupations Courses, completing the additional information called for at the bottom from the official records. This would provide the employer, the teacher and the school with a copy, which is desirable.

It would be most desirable to have these copies color-coded.

The teacher may find it desirable to maintain a separate file of Parent Permission blanks. If this is adaptable to the situation, a separate file could be handled more compactly by utilizing a 3 x 5 card file. The information would be duplicated on the card and the parent would need to fill in only the name of the child and sign on the bottom line.

> _____

Placement of Student in Occupational Experience Centers

After the list of qualified students and suitable occupational experience centers has been completed, the teacher has a big job in insuring that the proper student is placed in the right occupational experience center. We must keep in mind that the employer will always make the final selection of the student to be placed in his

business, but the teacher can perform certain activities that will make the transition smooth.

1. Prepare the Student.

   a. Give instruction in the competencies necessary for success on any job.

   b. Give orientation on the various job categories, so the student will have at least an acquaintanceship with this particular line of work.

   c. Help the student become aware of the competencies required specifically in the job area he is about to enter.

   d. Stress the necessity for consideration of personal appearance; cleanliness, suitable clothing that is neat and clean, appropriate shoes; hair that is cut in a conservative fashion and make up applied modestly.

   e. For the interview by having him:

      (1) Telephone the firm for an appointment for the interview.

      (2) Prepare a self-evaluation so he will recognize his own strong points and weak points; his ambitions; what he can do; what he has to offer; why he is interested in the work.

      (3) Know something about the company at which he is applying.

      (4) Get some idea of what salary or wage he can expect.

      (5) Realize the importance of being prompt for the interview.

(6) Know proper personal behavior during the interview.

(7) Know how to leave the interview.

f. To fill out an application blank if requested to do so, by:

(1) Reading directions carefully FIRST.

(2) Having work experience log available--most recent job listed first, etc.

(3) Having references: names, addresses and permission to use names.

(4) Knowing something about the job for which the student is applying.

(5) Realizing that spelling, handwriting, neatness and accuracy of the information on the application blank are all taken into consideration.

2. Prepare the Employer.

a. Provide him with detailed personal information on several eligible students.

b. Make sure that there is a clear-cut understanding of the mutual responsibilities of the employer and the student, the employer and the teacher, and the student and the teacher, in this program.

c. Assist the employer in any way possible in establishing the interview time, the selection of students if he requests it, and assure the employer of your utmost cooperation in making this experience mutually profitable to him and to the student.

Regulations in the Occupational Experience Program

There are so many facets of the occupational experience program that will be affected by prevailing laws, the teacher should prepare a check list in order to be sure that all phases of the program are in compliance with all of these prevailing laws and restrictions.

The following is suggested as such a check list:

1. School Liability
2. Teacher Liability
3. Employer Liability
4. Student Liability
5. Child Labor Laws
   a. Federal
   b. State
6. Social Security
7. Withholding Tax
8. Workmen's Compensation
9. Unemployment Insurance
10. Labor Unions
11. Other restrictions

State and Local Labor Regulations

The following laws may affect students working part-time and attending school part-time. Single agencies have issued pamphlets and bulletins covering one type of law, and these are usually available for a more detailed study from such agencies as the State Department of

Education, the United States Department of Labor, the State Security Commission, the State Department of Public Welfare, the Social Security Office, and the State Department of Distributive Education.

1. School District Liability

   A school district is a governmental function and as such is not liable in performance of governmental functions. If the school board approves, the school is not liable nor can it be sued. Be sure the occupational experience program is approved by the local board, and this is indicated by being recorded in the minutes of a board meeting.

2. Teacher Liability

   This is a matter of degree. There are no laws, basic principles or guide lines. In court, decisions are based on evidence of proper safety instructions. In such cases, it is helpful to have safety tests given, materials taught, dates, etc. Decisions are based on prudence. A jury decides negligence, if any.

   A teacher can purchase insurance. A comprehensive personal policy is specifically endorsed for teaching as an occupation. Teachers are agents of the school board and as long as they are acting for and under the school board, they are protected. In New Mexico, a teacher who is a member of the New Mexico Education Association is covered by a $10,000 court-costs policy.

   A comprehensive general liability policy or contract covering agents and employees of school districts and buildings is

available. This covers situations such as falling down stairs, cutting one's self, etc.

3. Employer Liability

An employer must have Workmen's Compensation Insurance. An employer or teacher cannot sign away rights for any individual as to a liability. Workmen's compensation policy premiums depend on the amount of the payroll. There are two kinds of workmen's compensation:

a. Statuatory employment--compensation is required.

b. Voluntary employment--for farmers, chauffeurs, servants, etc.

4. Student Liability

Insurance for himself is not required; however, it is well to suggest it. Two people cannot effect the rights of the third party.

Students working as a part of the work experience program would be subject to strict supervision of teachers, working as the agent of the school board would not be liable, but employer is not excused for tort--a wrong inflicted, injury.

5. Child Labor Laws

a. Federal--For those occupational experience centers which come under federal jurisdiction, the employer is charged with having all available information. The teacher, however, should familiarize himself with the laws, by referring to Child-Labor Bulletin #101, A GUIDE TO CHILD LABOR PROVISIONS OF THE FAIR LABOR STANDARDS ACT--U. S. Department of Labor.

b. State--Each state has slightly different child labor laws. Each teacher should contact the Employment Security Commission of his state for the laws and for assistance in correct interpretation of the laws. In New Mexico the law states:[1]

(1) Minimum age--14 in any occupation during the hours school is in session.

(2) Hours--for minors under 16, 8-hour day, 44-hour week. Prohibited to work between 7 p.m. and 7 a.m. in any occupation.

(3) Permit Certificate--Permit certificates are required for employment of children 14 and 15 years of age during school term, under 14 outside of school hours and vacations. Age certificates for minors 16 and over are issued by the superintendent or principal of schools for children residing within their respective school district.

(4) Minimum Wage--Students regularly enrolled in primary and secondary schools, working after school hours or on vacation, are exempted from minimum wage.

(5) Prohibited Occupations for Minors under 16--Minors under 16 are prohibited to work in any hotel, place of amusement, pool or billiard hall, bowling alley, theaters, concert halls, wholesale drug stores; in or about any establishment where malt or alcoholic liquors are manufactured, packed, wrapped, or bottled; in the

---

[1] How New Mexico Labor Laws Protect You, Pamphlet, New Mexico Department of Labor; Santa Fe, New Mexico.

preparing any composition in which dangerous or poisonous acids or alkalies are used; manufacturing of paints, colors, or white lead; dipping, drying or packing matches; manufacturing, packing, or storing powder, dynamite, nitroglycerine compounds, fuses or other explosives; manufacturing of goods for immoral purposes; oiling, wiping, or cleaning machinery while in motion, or assisting therein. Prohibited from operating the following: passenger or freight elevators; automobile, motor cars, or trucks; laundering machinery, dough brakes or cracker machinery of any kind; belted sewing machines in any workshop or factory (or assisting therein in any capacity whatever); adjusting any belt to any machinery; circular saws (or assisting in operating) wood jointers, wood shapers, planes, sandpaper, or wood polishing machinery; picker machines, wool, cotton, or hair picking machines; paperlacing machines, burnishing machines in any tannery or leather manufactory; job or cylinder printing presses operated other than foot power; emery or polishing wheels for polishing metal; wood turning or boring machinery; steam boilers, steam machinery or other steam generating apparatus; power punches or shears; washing, or grinding or mixing mills.

6. Social Security

If a student does not have a social security card, he should check at the nearest Social Security Office and apply for one.

Application blanks may also be picked up at the local post office. Nearly all occupations are now covered by social security and if the student earns more than $50 in a quarter of a year, he will have social security deducted from his wages.

7. Withholding Tax

The employer will withhold a certain portion of the student's wages from his pay for Federal Income Tax purposes. If the earnings during a calendar year do not exceed $600, the student may file for a refund. This is not to say that the student may not file a tax return if he makes over $600, but only indicates that each student is presently given a $600 deduction regardless of whether his parents claim him for tax purposes.

8. Workmen's Compensation

Workmen's compensation for business is a madatory program in most states. Students are covered by this insurance as long as they are compensated employees. State Insurance covers all age groups whereas some private insurance rates vary according to the age groups to be covered. Since employers are given the choice of buying state or private insurance, it would be best if each teacher would check to see if each employer's insurance covers the age bracket in which the student falls.

9. Unemployment Insurance

Check with your State Unemployment Security Commission about unemployment insurance. In New Mexico, students are considered part-time employees and are not eligible for unemployment.

10. Labor Unions

Before any student is placed in a training center, it should

be determined to what extent, if any, the labor unions representing employees are involved. This information can be secured from the employer, employees or labor union representatives. As each occupational experience center is an individual establishment and the work may vary, each student's case must be handled individually. It is the responsibility of the teacher to see that this determination is made.

Developing Educational Plans

In order that the occupational experience program can meet the goals set forth, planning will need to be a cooperative activity between the teacher, and the employer. There needs to be a definite understanding between the teacher and the employer as to which learning experiences will be supervised by each one, and the responsibility of the student himself in developing certain competencies.

It is to be assumed that the student will have a general background in the subject matter of the vocational area. How much specialized information or level of skill the employer is entitled to expect of the student at the time he enters his employment, will depend to a great extent upon the specific job.

For example, in the area of Office Occupations Experience, a secretarial student would be equipped with a salable skill of shorthand and typewriting. In the same Office Occupations Experience Program, a student placed in an office-clerical position, would possess no shorthand skill, but would have only a salable skill in typewriting. From the same Office Occupations Experience Program, a student with no IBM Machines experience, might be placed in an office that is willing to take the student with no previous acquaintanceship with IBM machines and develop right on the job a salable skill on machine operation.

It is to be assumed, however, that there are competencies needed to be successful in any line of work. These are to be developed to the greatest extent possible by the student, motivated by the teacher and the home, in order that the student will be better equipped to take his position as an employee and can benefit to the maximum extent from his experience.

The community survey could serve as a guide in preparing a list of specific competencies needed for a particular job, but the following might be a good starting list of general competencies needed.

General Competencies Needed for Success in any Occupation

1. Health habits
   a. Cleanliness about person and clothing
   b. Adequate sleep as it reflects in alertness and disposition
2. Responsibility
   a. On time
   b. Accepts and carries out duties
   c. Honest
   d. Accurate and careful
   e. Care of and concern for materials, equipment, and safety factors
3. Adaptability
   a. To other people
   b. To changing situations
   c. Or application of knowledge in the work situation
4. Appreciation of or attitude toward
   a. Himself
   b. His teacher
   c. His fellow students
   d. His employer
   e. Work to be done
   f. Life in general
   g. Plans for the future
   h. Desire for Improvement

5. Ability to

   a. Follow instructions

   b. Use time effectively

   c. Exercise initiative and judgment

   d. Look ahead; anticipate problems as well as opportunities

Specific Plans for Occupational Experience Program

A coordinated plan for the classroom instruction and on-the-job experience is a must. Therefore, it should be made jointly by the teacher and the employer.

The employer should prepare a list of the duties or the steps in the progressive learning situation on the job and the teacher would have a plan of study in the classroom to prepare the student to meet the demands of the work experience. This means the classroom instruction would be a step ahead of the occupational experience; however, in the event the student encounters a situation in which a skill or concept has not been taught, the teacher would make prevision for this need in the plans.

The following form might be used for such planning.

CLASSROOM INSTRUCTION	ON-THE-JOB EXPERIENCE
July 1	July 1
July 2	July 2

The student would keep a record of the various experiences or duties performed each day and a periodic check-up would indicate whether

or not the plan is being followed and point up needs for revisions in plans or in teaching procedures of either the teacher and/or employer.

See Appendix 3 for Placement Agreement.

TEACHING, SUPERVISING AND COORDINATING

OCCUPATIONAL EXPERIENCE PROGRAMS

Committee III

Joyce Coffey

University Park, New Mexico

Glen Gabehart, Chairman
Lovington, New Mexico

Teaching, Supervising and Coordinating Occupational Experience Programs

Occupational experience is essential if a student is to become proficient in the skills necessary to become successfully employed. Along with experience on the job, the student needs classroom work related to the occupational experiences. The occupational experience program requires proper cooperation and communications between the school, teacher, occupational experience center, student and parents.

OBJECTIVES:

1. To develop an understanding of and appreciation for occupations being considered for employment.
2. To determine qualifications needed for the available job opportunities.
3. To provide experience to each student for the purpose of determining his strengths and limitations to aid him in making occupational choices.
4. To develop skills and abilities required for students to assume duties and progress on the job.
5. To integrate the subject matter being taught with the needs of each student at the occupational experience center.
6. To provide proper supervision of the student by the teacher and employer at the occupational experience center.

Teaching Occupational Experience Programs

Several plans may be used in teaching occupational experience programs. Consideration should be given to the available training centers, the number of students that can be placed in each training center, the number of closely related training centers, the facilities

of the school, and the competencies of the teacher. A survey may be conducted to determine local conditions and possibilities and serve as an aid in selecting the best plan for the community.

No attempt has been made to set up time schedules or requirements because of the wide range of occupations available for training, the differences in the length of periods at schools, and the differences in school requirements.

One of the following plans may be employed. Variations of these plans could be adapted to fit local situations.

Plan A. (For multi-occupational experience programs)

Plan A is probably the most difficult occupational experience program to properly instruct, supervise and coordinate. More information on Plan A is included in this study because of its difficulty.

Instruction may be of two types: A core of general related instruction which will be presented to all students regardless of the occupation in which they are working, and technical instruction related to each specific job area in which the different students will be working. There may be specific technical information common to two or more job areas that could be taught as a unit by the teacher. If this is feasible it may be employed.

General related subject matter

1. The occupational opportunities available in the area, state, and nation with respect to persons employed, trends, etc.
2. The effect of education on lifetime earnings.
3. Steps in selecting a career.
4. Developing career briefs.
5. Desirable characteristics for a job.

6. What the employer expects from you.
7. Writing letters of application.
8. The personal interview.
9. How to succeed on the job.
10. The importance of continuous education.
11. The apprenticeship program--labor organizations.
12. Laws affecting workers.
13. Insurance programs (Social Security, Workmen's Compensation, Life Insurance programs.)
14. Your responsibilities as a citizen of the community.
15. Safety.
16. Work habits and attitudes.
17. Cleanliness and grooming.
18. Problem solving ability.
19. Job initiative.
20. Loyalty.

Specific technical subject matter has to do with the information and knowledge needed for competency in a skilled occupation. Since each student will be covering different material involving different occupations, group teaching techniques may be more difficult to employ. Individualized instruction must be used more frequently so that the needs of each student can be met. Most of this will be done through individualized study.

The material which a student studies during the specific related instructional period will be determined from the education plan and should be correlated with the occupational experience in which the student is engaged.

A student study guide should be developed for each phase of the occupational experience program. In some cases these have been developed by other states and are available for a nominal fee.

The student study guide should contain key questions, problems and other assignments to enable the student to become familiar with the information which the occupational experience plan lists as being pertinent to the occupational experience. The study guide should also list the references and, in some cases, present basic information so that the student may comprehend the material by working on an individual study basis. A sample student guide is included. A source of information on student study guide can be obtained from Industrial Education Department, University of Texas, Austin, Texas. The title is "Student Study Guide for use in Cooperative Training Programs."

Plan B. (For single-occupational experience programs)

Plan B should be the most effective plan because it allows the use of common instructional materials, is more concentrated and lends itself to more teacher control because group teaching is used. It should allow the teacher to use his abilities and training more effectively in the area for which he is most qualified.

This plan requires the teaching of a core of general related material and technical information as did Plan A. However, the technical information will be the same for each student because Plan B will consist of students studying for a single occupation. (Example: ornamental horticulture) This eliminates the necessity of individual study as the primary means of instruction and allows the teacher to use group instruction methods. Attempts may be made to correlate the instruction with the work activities at the occupational experience center, but it

Assignment Sheet

JOB TITLE

1. Job description, history and other general information.

2. Student assignment.

   a. Assign references to read.

   b. Drawings or other special assignments.

3. List of references.

4. Problems to be solved: (Questions)

   a. Questions are in the form of an objective type test.

is not considered as a must. A student might receive instruction for one or two years prior to being placed in an occupational experience center.

This plan could use a laboratory when the development of skills prior to job placement are either necessary or desirable. The use of a school laboratory might also aid the student in developing proficiencies needed to progress on the job that would not be possible under classroom situations.

Plan C. (For multi-occupational experience programs with laboratory facilities.)

Careful consideration should be given to the selection of job areas in Plan C. The use of laboratories requires that the job areas be closely related. The teacher must be proficient in teaching laboratory skills. In most cases he would not be effective outside his educational field. Team teaching of laboratory instruction might be given consideration.

This plan may be used when extensive laboratory facilities can be made available for several job areas. In some instances a single laboratory might fit the needs of several job areas. In other instances several different laboratories may be needed. For example, a single "office machines" laboratory may fit the needs for a business occupations experience program. A multi-experience program in agriculture might require a greenhouse, farm mechanics, and animal science laboratories.

Coordinating Classroom Instruction With the Occupational Experience

To be effective, occupational experience programs must provide "learn by doing" experiences. The occupational experience must bridge the gap between classroom theory and actual practice. The classroom

work should aid in developing skills and abilities needed in the student's occupational experience program. Effective coordination of all phases of the occupational experience program must be maintained to insure that the training being received by the student is developing necessary skills and abilities and is fitting him for future employment.

The following are suggestions that will help in coordinating the classroom instruction with the occupational experience.

1. Use community, area, or state occupational surveys to determine job opportunities and skills necessary for these jobs. In some cases the teacher may have to make his own survey or interpret existing surveys in terms of his needs.

2. Organize an advisory council.

3. Prepare common instructional material needed by all students.

4. Have graduates of the occupational experience program evaluate the classroom instruction.

5. Confer with employer on shortcomings of student.

6. Check progress reports of student and compare them with their occupational experience schedules. Make adjustments in classroom instruction if necessary.

7. Confer with school administration concerning needs of instructional equipment to better fit classroom instruction to the needs of the students.

8. Develop study outlines or units for each occupational experience area.

Supervision of Student at the Occupational Experience Center

It is important that there be a clear understanding of the responsibilities of the student, parents, the school, and the employer. Close working relationships between the school and the business establishments result in improved community understanding of the entire school program and greater cooperation in all school activities.

Both students and teacher are able to bring to the school a fresh outlook and a keener realization of how the school can be of greater practical service to both individual students and the entire community.

Supervision by the employer

1. Assist in the development of the occupational experience plan.

2. Provide instruction at the training center.

Supervision by the occupational experience teacher

1. Work closely with the employer and/or the person directly responsible for training the student.

2. Make periodic visits to the training center to check with the employer.

3. Observe the student in training.

4. Develop course content for in-school instruction.

5. Cooperate with the employer in establishing work processes and schedules for the occupational experience.

6. Secure occupational experience positions for students enrolled in the course.

7. Recommend to employers the students with the skills, abilities, and interests necessary for each job.

8. Be responsible for a continuous follow-up to make certain that both student and employer are satisfied with the occupational experience plan and benefiting from the arrangement.

A workable program of cooperative part-time training is impossible unless the teacher can arrange to visit and observe those enrolled in the program. Through these visits the teacher will be able to create a friendly and sympathetic attitude between school and business and at the same time broaden his own knowledge. They are valuable in correlating related classroom instruction with the occupational experience; in making comparisons between actual work accomplished with the occupational experience plan content; and in evaluating the student's progress on the job.

It is necessary for the teacher to know in what ways a student does well on the job and in what ways he is weak. The teacher who supervises the work of employed students serves in a dual capacity. In addition to his responsibilities for the instruction and guidance of the students, he performs an extremely important public relations function.

Following is a list of information to gather when a coordinator makes a supervisory visit.

1. Is the employer satisfied with the student?
2. What is the student's attitude toward his job, employer, fellow workers?
3. Is the student progressing according to the occupational experience plan?
4. What instruction is being given on the job?
5. Is the student satisfied with his occupational experience?
6. What related instruction is in need of urgent attention?

EVALUATION OF THE OCCUPATIONAL EXPERIENCE PROGRAM

Committee IV

Alvin Cook, Chairman

Quemado, New Mexico

Mario L. Cardenas

Taos, New Mexico

Evaluation of the Occupational Experience Program

Evaluation defined:

"Evaluation is the process of determining how well people are accomplishing what they set out to do."[1] The evaluation of occupational programs is concerned with collecting and analyzing evidences of progress towards goals or objectives accepted as being important by the persons who conduct these activities.

Evaluation becomes a valuable tool for measuring progress towards goals and for determining the weaknesses as well as the strengths in the process of attempting to reach these goals. To be worth while evaluation must be continuous. It has to be part of the teaching process. It is not just something that is done at the end of a course or program.

Evaluation is a tool; it is not an end in itself. It is the means by which programs and methods can be made more effective. If an evaluation is to be effective, those workers must incorporate the findings into their program.[2]

Evaluation of the Occupational Experience Program by the Teacher, the Student and the Employer

The teacher, the student and the employer must each contribute his fair share in the evaluation process. The success of the program will be determined by how well the following objectives have been met:

---

[1]George P. Deyoe, Farming Programs in Vocational Agriculture (Illinois: The Interstate Publishing Company, 1953) p. 152

[2]Adopted from Evaluation in Extension, Division of Extension Research and Training, Federal Extension Service. H. M. Ives and Sons, Inc. Topeka, Kansas. 1959

Objectives

1. To develop an understanding of and appreciation for occupations being considered for employment.

2. To determine qualifications needed for these available job opportunities.

3. To provide experience to each student for the purpose of determining his strengths and limitations to aid him in making occupational choices.

4. To develop skills and abilities required for students to assume duties and progress on the job.

5. To integrate the subject matter being taught with the needs of each student at the occupational experience center.

6. To provide proper supervision of students by teacher and employer at the experience work center.

The following factors must be considered in accomplishing the above mentioned objectives by persons as indicated:

Teacher responsibility

1. To establish guide lines for measuring progress towards the objectives, and a program for the individual student. Guide lines should be established in cooperation with the school's guidance department.

2. To establish and maintain a cumulative record which will contain the following:
   (a) Test scores
   (b) Personality rating scales of the student as rated by the teacher and employer.
   (c) Student's medical record.
   (d) Program appraisal forms.
   (e) Summary of student's occupational experience records.

3. Place student in proper occupational work center.

4. To visit and observe the student on-the-job. The frequency of visits will depend upon need of student.

5. Check student's records to establish a systematic method of keeping them current.
   (a) Criteria for advancement in youth organization.
   (b) Performance and progress on the job.

6. To maintain a favorable environment among the persons involved in the training program.

7. Develop annual and long range programs and make the necessary modifications as the need arises.

8. Together with the employer evaluates the student's progress.
   (a) By casual on-the-job observation.
   (b) During individual conferences.
   (c) Classroom work
   (d) Employer conferences.

9. Develop and establish a method of evaluating student's progress up to five years after termination of training.

10. Develop the most adequate way of grading the student up to the termination of the course.

11. Inform the student of the method of grading for the type of course.

12. To cooperate with the counselor in determining any changes of student's concepts, ability to solve problems, interests, attitudes, increase in knowledge and shift in values.

13. Develop criteria for the evaluation of the training center.

14. To evaluate his teaching effectiveness in those areas concerned with occupational experiences.

15. Furnish the employer with a rating sheet for evaluation purposes.

<u>Student's responsibility</u>

1. Discusses his present occupational experiences during student-teacher conferences.

2. Discusses with the teacher his further needs and interests to obtain maximum benefit from the program.

3. Discusses with the teacher the possibility of making additions to the program.

4. Keeps accurate and up to date records.

5. To establish and maintain a good working attitude throughout his occupational experience.

6. To follow the rules and regulations set up by the school, the teacher and the employer.

<u>Employer's responsibility</u>

1. To work in conjunction with the teacher in making program evaluation.

2. To cooperate with the teacher in evaluating periodically the student's performance.

Follow-up

"Follow-up refers to a number of purposes and procedures by which continuous information can be gathered and analyzed to determine development, activities, and adjustment of students."[1]

Purpose of Follow-up

"Essentially, a follow-up of students can be used to revise the curriculum, to identify students in need of assistance and to improve the occupations program generally."[2] A follow-up also helps in measuring the effectiveness of the individual supervising the program, and to evaluate in terms of whether the program has provided the necessary experiences.

A follow-up study requires careful planning, careful delegating of responsibility, and means of collecting data continuously.

Follow-up for occupational experience programs should consist of

1. Gathering data about the student up to five years after the termination of his work experience program.

2. Work together with guidance services to help gather, analyze, and interpret data.

The following factors should be used in evaluating the classroom instruction[3]

1. Is the class carefully planned for in advance?

2. Does the classroom instruction include a variety of teaching methods and techniques such as conferences, lectures, films, panel discussions, student reports, and individual and group projects?

---

[1]Dean C. Andrew and Roy DeVerl Willey, Administration and Organization of the Guidance Program (New York: Harper and Brothers, 1957) p. 294

[2]Ibid

[3]Work Experience Education, California State Department of Education, 1965 Edition.

3. In the planning of instruction, is full advantage taken of community resources by such activities as field trips to local firms and appearances of community leaders before the class?

4. Are the students' individual problems given attention?

5. Is information presented concerning the basic skills and attitudes that are common to all employment?

6. Does the instructor use suitable instructional materials in the classroom?

7. Are reports made by the employer and teacher used as a basis for classroom instruction and conferences?

8. Are students given an opportunity to participate in the evaluation of classroom instruction?

The following factors should be used in evaluating the occupational experience centers

1. Are employers carefully briefed concerning the purposes of the work experience education program and of the work centers?

2. Are work centers selected on the basis that facilities provide adequate work experience?

3. Do the work centers provide opportunities for well-organized, varied learning situations?

Suggestions for Evaluating the Courses

1. The number or percentage of students who were placed in the occupations for which they were trained.

2. The degree of success of the employee on the job as reported by the employer.

3. The acceptance of the course by present and prospective employers of students.

4. Employer evaluation of the quality of work performed by employees who have completed the course.

5. Number of students who are enrolled in post high school programs following graduation.

6. Upon completion of the course, what is the reaction of student toward the value of the program?

7. The number of students who for six months continued to work for their first employer following graduation.

8. Number of former students who are employed in the area for which they were trained a year or more after completion of the course.

9. Reason given by students who: (a) dropped out of the course (b) who terminated their employment.

10. Number of former students who have advanced to a higher level of employment.

11. Reaction of parents of student toward the course of instruction.

12. Reaction of school administrators toward the effectiveness of the course.

13. Acceptance of the course by the advisory committee.

14. Enrollment trends in the course.

PLACEMENT AGREEMENT
for
SUPERVISED OCCUPATIONAL EXPERIENCE

If the student is to benefit to the fullest extent from the occupational experience program, it is necessary to have the cooperation of the student, the parents, the teacher and the employer. This cooperation can best be attained if all the people participating in the program have a definite understanding of their responsibilities to the program as well as an understanding of the responsibilities of each of the other people involved in the program.

IT IS UNDERSTOOD THAT THE TEACHER AGREES TO:

___ 1. Assume responsibility for the planning and implementing of the program.

___ 2. Assist the employer in the occupational experience program planning.

___ 3. Assist the employer in ghe selection of students for employees.

___ 4. Visit the student on the job at regular intervals for the purpose of coordinating class instruction and the actual occupational experience.

___ 5. Evaluate the progress of the student in terms of the objectives outlined in the planned program.

IT IS UNDERSTOOD THAT THE EMPLOYER WILL:

___ 1. Provide the student with opportunities to learn how to do a job well.

___ 2. Provide a progressive learning situation for the student.

___ 3. Teach the student the most effective ways of doing the work, and at the same time, develop work habits and attitudes that will enable the student to adapt to changing situations.

IT IS UNDERSTOOD THAT THE STUDENT WILL:

___ 1. Recognize that the employer must profit from his labor in order to justify hiring him.

___ 2. Behave in a business-like manner on the job; punctual, dependable, loyal and well groomed.

___ 3. Follow instructions, avoiding unsafe acts and staying alert at all times.

___ 4. Be courteous and considerate at all times.

___ 5. Keep accurate records of occupational experiences as designated.

IT IS UNDERSTOOD THAT THE PARENTS WILL:

___ 1. Cooperate with the teacher, employer, and the student in their efforts to make the occupational work experience program most profitable to the student by:

___ stressing the opportunities provided by such a program, that cannot be found elsewhere.

___ encouraging the student to develop and cultivate desirable personal habits of cleanliness about the person and clothing.

___ encouraging the student to develop good work habits and attitudes toward the world of work and life in general.

ALL PARTIES AGREE TO:

An initial trial period of _____ working days to begin on _____ 19 __, to allow the student to adjust and prove himself at _____ Occupational Experience Center and will continue to work until _____ 19 __, unless the arrangement becomes unsatisfactory to either the student or employer or both.

The usual working hours will be as follows:

While attending school_____

When not in school_____

Provision for overtime_____

Provisions for time off_____

Wages will be at the following rate(s):

DOCUMENT NOT AVAILABLE FROM EDRS 73p.

*INDIVIDUAL CHARACTERISTICS, *AGRICULTURAL SKILLS, *VOCATIONAL AGRICULTURE, HUMAN RELATIONS, SALESMANSHIP, BUSINESS SKILLS, PLANT SCIENCE, ANIMAL SCIENCE, AGRICULTURAL MECHANICS, LIVESTOCK PROCESSING OCCUPATIONS, DAIRY PROCESSING OCCUPATIONS, CROP PROCESSING OCCUPATIONS, AGRICULTURAL SUPPLY OCCUPATIONS, POULTRY PROCESSING OCCUPATIONS, ORNAMENTAL HORTICULTURE OCCUPATIONS, AGRICULTURAL MACHINERY OCCUPATIONS, *EMPLOYMENT OPPORTUNITIES,

*EDUCATIONAL NEEDS,

An analysis of data from 2,000 job title interviews in over 700 agricultural businesses in Oklahoma resulted in the identification of 100 job titles requiring competencies in agriculture. The competencies were grouped into nine categories -- (1) human relations, (2) employee traits, (3) salesmanship, (4) business management, (5) agricultural business management, (6) plant and soil science, (7) animal science, (8) agricultural machinery and power, and (9) building construction technology. Current and anticipated employment opportunities, worker characteristics, and needed competencies were determined for the 33 job titles offering the greatest employment opportunity and are included in the report. The job titles are in agricultural machinery, livestock processing, dairy processing, crop processing, agricultural supply, ornamental horticulture, agricultural machinery, and poultry processing occupations. JOB TITLE PROFILES
IN
OFF-FARM AGRICULTURAL OCCUPATIONS

INTRODUCTION

This report is an analysis of data from two thousand job title interviews in over seven hundred off-farm agricultural businesses in Oklahoma. These interviews identified one hundred job titles indicating positions which require competencies (skills, knowledge, or understanding) in agriculture. Managers of the businesses studied indicated from a list of sixty competencies the degree of competency level (3-High, 2-Some, 1-None) needed in the various job titles in their businesses.

The sixty competencies have been grouped into nine categories as illustrated on the following two pages and the level needed in each category has been calculated for each of the leading job titles. There are many other job titles but this report deals only with those found to offer the greatest employment opportunities for agriculturally trained people in the next few years.

Information on the thirty-three job titles in this report covers the employers' estimate of current and anticipated employment; worker characteristics such as salary, education, minimum age, and residential background preferred; and competencies needed to be successful. This information should be useful in determining course offerings and in planning curriculum. The degree of competency needed in each of the competency groups should determine the amount of instruction given in that subject for a particular job title within a type of business. Use of these tables in curriculum construction should result in a training program specifically designed to develop the level of competency in the employee which the employers have indicated is necessary.

It is hoped that vocational agriculture instructors will make this information available to guidance and counseling personnel within their respective schools in order that students may become more familiar with opportinities in the field of agricultural business.

A Checklist for a Survey of Distributive Education Programs Organized Under the "Cooperative Plan."

Levendowski, J. C.

Calif. State Dept of Educ, Sacramento. Bur of Bus Educ.

Sep 65

DOCUMENT NOT AVAILABLE FROM EDRS 17p.

*DISTRIBUTIVE EDUCATION, *PROGRAM EVALUATION, *COOPERATIVE EDUCATION, *SENIOR HIGH SCHOOLS, *POSTSECONDARY EDUCATION, CHECKLISTS,

Statements concerning cooperative distributive education are grouped under headings -- (1) "Organization of the Distributive Education Program," (2) "Staff Members," (3) "Support of the School," (4) "Selection and Guidance of Students," (5) "Placement of Students in Training Stations," (6) "Coordination and Public Relations," (7) "Curriculum Organization and Instruction," and (8) "Classroom Facilities and Library." The survey respondent is to read the statements twice, first rating each as (1) undesirable, (2) of average importance, or (3) highly desirable, and second, to show the degree to which each practice is carried out in his program -- (1) not at all, (2) average, with room for improvement, and (3) to a high degree. An answer sheet is included. (SL)

A CHECKLIST FOR A SURVEY

OF

DISTRIBUTIVE EDUCATION PROGRAMS ORGANIZED UNDER THE

"COOPERATIVE PLAN"

September, 1965

Prepared by:
J. C. Levendowski
Researcher and Teacher Educator
Bureau of Business Education
California State Department of Education

VT000332

DISTRIBUTIVE EDUCATION PROGRAMS ORGANIZED UNDER THE "COOPERATIVE PLAN" *

A CHECKLIST FOR A SURVEY

Prepared by J. C. Levendowski
Bureau of Business Education

Your Name _____ City _____ State _____

Your Position _____

Your School _____ Is it a high school? ___ Junior College? _____

Total School Enrollment at Present _____ How many years of continuous experience have you had in distributive education programs? _____

Present distributive education class enrollment: _____ boys, _____ girls, _____ Total _____

How many years has this school been operating a distributive education program? _____

Is your school program aided by state vocational education funds? _____

Do you receive Bureau of Business Education distributive education instructional aids and supervisory visits in the operation of your program? _____

DIRECTIONS FOR USE OF CHECKLIST

Distributive education teachers should make ratings in both the (1) desirability and (2) accomplishment of practices in Columns 1 and 2.

The two columns of numbers 0, 1, and 2 and alphabetical terms A, B, and C are to be circled. PLEASE COMPLETE ALL OF COLUMN I - "DESIRABILITY" BEFORE BEGINNING COLUMN II - "ACCOMPLISHMENTS."

Under the "desired" column the meanings applied to the numbers are as follows: 0 to mean that the practice is undesirable and should be omitted, 1 that you consider the practice of only average importance and desirability, and 2 to mean that you agree that the practice is very important and highly desirable.

Under the "accomplished" column the numbers are to be used with the following meanings: A to mean that the practice is not being carried out at all or does not prevail in your program, B that your program is accomplishing the practice to an average degree with some room for improvement, and C to mean that your program is accomplishing or has achieved the practice to a high degree.

* Basic material for this survey was developed by Dr. William B. Runge, Distributive Education Teacher Educator, University of New Mexico.

DISTRIBUTIVE EDUCATION PROGRAMS ORGANIZED UNDER THE "COOPERATIVE PLAN"

A CHECKLIST FOR A SURVEY

Part I
ORGANIZATION OF THE DISTRIBUTIVE EDUCATION PROGRAM

1. A clearly written statement of objectives has been developed for the distributive education program.

2. Objectives have been developed through the cooperative efforts of employers, educators, and students.

3. The school administrators and faculty members have been given a clear concept of the place of this program in the total educational system.

4. Standards for the operation of the program have been developed and accepted by the school administrators.

5. The teacher coordinator checks to see if practices meet standards which have been developed.

6. A clear cut assignment of functions and duties has been given to all persons concerned with the distributive education program.

7. A long range plan of development has been worked out and serves as a guide for operations.

8. An advisory committee representative of all groups interested in the program has been formed and its advice is used in the development of the program.

9. The distributive education program is operated as an occupational education program and not just as an employment office for students.

10. The teacher coordinator is allowed sufficient time for coordination activities.

11. The teacher coordinator is not overloaded with extra-curricular activities and other subjects to teach.

12. School and training station schedules are developed to meet the needs of students in the distributive education program.

13. School credit is given for the occupational experience of students in training stations.

14. Secretarial and clerical help are available to the teacher coordinator.

15. A record keeping system has been designed to meet the needs of the distributive education program.

16. The records and reports are kept up to date and complete.

17. Funds are provided for the travel expense of the teacher coordinator.

18. The program receives state supervision in planning and development.

19. The staff from the Bureau of Business Education helps in the continued development of the local program.

Part II
STAFF MEMBERS

1. The teacher coordinator has completed at least a bachelor's degree in college.

2. The teacher coordinator has completed a minimum of 9 semester hours in professional vocational and distributive education subjects such as organization, coordination, methods, and curriculum development.

3. The teacher coordinator has completed at least 15 semester hours in technical subjects such as merchandising and management.

4. The teacher coordinator gains additional occupational experience in a distributive occupation at least once every three years.

5. The teacher coordinator maintains membership in at least one local civic organization such as the chamber of commerce or a luncheon club.

6. The teacher coordinator takes an active part in community affairs other than those dealing strictly with business.

7. The teacher coordinator attends most local and state meetings called by the Bureau of Business Education.

8. The teacher coordinator takes an active part in local and state school activities in addition to those for distributive education personnel.

9. The teacher coordinator makes a constant effort to improve business and professional relationships.

10. The teacher coordinator has had at least one professional magazine article accepted and published in the past three years or has one in the process of preparation.

11. The teacher coordinator contributes to the state and national student club program.

12. The teacher coordinator plans and carries out research resulting in the constant improvement of the program.

13. The teacher coordinator welcomes constructive criticism and constantly strives for improvement of his program.

Part III
SUPPORT OF THE SCHOOL

1. Vocational education is accepted and acknowledged as a desirable and essential function of the school.

2. The distributive education program is accepted as an integral part of the total school plan.

3. The school administrators take an active and interested part in the planning and operation of the distributive education program.

4. The school administrators occasionally accompany the teacher coordinator when contacting employers and visiting students at their training stations.

5. The school administrators cooperate with the state and national distributive education organizations.

6. Teachers and other staff members cooperate with the teacher coordinator in the operation of the distributive education program.

7. Most financial requests of the teacher coordinator have been allowed.

8. Assignment of building space and facilities is sufficient to carry on a distributive education program.

9. School administrators check with business representatives, faculty members, community groups and pupils relative to the effectiveness of the program.

10. The school administration and the teacher coordinator use the services of the state department in evaluating and in improving the program.

Part IV
SELECTION AND GUIDANCE OF STUDENTS

1. Prospective distributive education students are given a clear understanding of the purposes and nature of the program before they are enrolled.

2. Experienced counselors help each student in determining his aptitude, interest, and ability to profit from the distributive training.

3. The teacher coordinator arranges for the collection of occupational information regarding distributive occupations.

4. Minimum age, grade, and other standards have been developed and must be met by students before they enroll in the distributive education program.

5. Distributive education pupils are successful in the general education program before entering the distributive education program.

6. Students may elect the distributive education program and also meet graduation requirements.

7. A top limit is placed on the total number of students enrolled in the distributive education program.

8. The teacher coordinator determines the final selection of students who are recommended for the distributive education program.

9. Employers are given a part in the final selection of students.

10. The teacher coordinator has a definite part in the performance of the guidance functions in the school.

11. A cumulative record is kept on each student.

12. Periodic counseling interviews are held with each student concerning his general progress in the program.

13. Provision is made for parents to contact the teacher coordinator when needed.

14. Definite provision is made for checking on each student's progress in school.

15. A student follow-up survey has been made of school leavers and graduates to see whether they enter distributive occupations.

16. Graduates and school leavers return to the school for counseling and guidance on personal and other problems.

17. Former students are followed up to find how additional adjustments can be made in the program.

18. Follow-up records are kept for each student in the distributive education program during the past five years.

Part V
PLACEMENT OF STUDENTS IN TRAINING STATIONS

1. An employment opportunities survey which indicated a need for training in the distributive occupations has been made in the community.

2. A written statement has been prepared outlining the criteria by which training stations are finally selected.

3. The teacher coordinator contacts employers and sets up training stations for all students in the class.

4. Employers provide training stations throughout the entire school year rather than for just seasonal work.

5. Plans of training and training agreements are drawn up by the employers, school, and students.

6. Students who already have part time jobs are admitted to the distributive education program after the training station is approved by the teacher coordinator.

7. The teacher coordinator checks conditions under which students work to see that they are in accordance with state child labor laws.

8. Students are regularly employed for a monetary wage at a rate comparable to that paid other employees for similar work.

9. Pay schedules provide for gradual increases throughout the training program.

10. The total time students spend in school and on the job does not exceed 48 hours per week including Saturdays.

11. All students enrolled in the class are employed on the average at least 10 hours per week, Monday through Friday, during the school year.

12. Training stations may provide an opportunity for full time employment after students complete school.

13. Instruction in how to apply for a job is given before students are referred to prospective employers.

14. Before students are considered permanent members of the program, they must be accepted for employment in a training station.

15. Training sponsors are appointed by employers for each student.

16. Students are rotated and given a variety of on-the-job occupational experiences.

17. The teacher coordinator helps employers and training sponsors in the techniques of supervision.

18. Provision is made occasionally for students to be released from school in order to work during special sales and rush hours.

19. Provision is made occasionally for students to be released from work to participate in school sponsored activities.

20. Employers are informed of the progress made by students in their school work.

21. Employers make periodical ratings and reports on each student in their business establishments.

22. The teacher coordinator assists employers in evaluating the on-the-job progress of students.

23. The teacher coordinator develops new training stations continuously.

Part VI
COORDINATION AND PUBLIC RELATIONS

1. The teacher coordinator plans his coordination time and develops a schedule which is followed to a reasonable extent.

2. Coordination time is used only for coordination purposes.

3. The teacher coordinator visits all students at their training stations a minimum of once each month.

4. Visits are made by the teacher coordinator to the employers of students at least once a month.

5. Labor union regulations are followed in the placement and training of distributive education students.

6. The teacher coordinator uses the information from coordination activities to help in adjusting problems that arise relative to the program.

7. Reports of coordination activities are kept.

8. The teacher coordinator has a written promotional plan and schedule for the year.

9. The teacher coordinator makes talks at club meetings and before business groups.

10. Articles on the program appear regularly in the local newspaper.

11. The teacher coordinator has a mailing list of all interested persons who receive information on program activities and progress.

12. The distributive education program has been explained at meetings of various educational groups in the community.

13. All students who are eligible enrollees are acquainted with the distributive education program.

14. Distributive education students appear before community groups and help in the development of public relations for the program.

15. Articles on the distributive education program appear in each issue of the school newspaper.

16. The students sponsor joint employer-employee dinners and other such activities.

17. Parent groups have been acquainted with the program.

18. Alumni are kept informed of the growth and development of the program.

19. The teacher coordinator is conscious of the value of publicity at all times and makes an effort to keep the school and community informed of the progress of the program.

Part VII
CURRICULUM ORGANIZATION AND INSTRUCTION

1. A distributive education curriculum has been developed for students entering the program.

2. The instructional activities are correlated whenever possible with activities in other subject matter areas.

3. The teacher coordinator teaches the "control class."

4. The teacher coordinator either teaches or helps plan other courses which are related to the distributive education student needs.

5. Follow-up studies of graduates are used to guide curriculum revision.

6. Student-teacher planning is carried on in the development of class and on-the-job occupational experiences.

7. A real effort is made by the teacher coordinator to make the daily instruction in the classroom dovetail with experiences at the training station.

8. Provision is made for individual study in the "control class."

9. Frequent use of student occupational experiences is made in class discussions.

10. Remedial teaching is given on a basis of individual student needs.

11. Adequate records of student progress are available, and they are used in developing the instructional program.

12. Audio and visual aids are used whenever such techniques will make the activities more meaningful to students.

13. Opportunity is provided for field trips to business firms.

14. Students are encouraged to and do contribute instructional materials, information, and other aids.

15. The teacher coordinator periodically evaluates the classroom instruction.

16. Students participate in the evaluation of their own achievement.

17. Students are encouraged to participate in extra class activities related to this business area.

Part VIII
CLASSROOM FACILITIES AND LIBRARY

1. Classroom and laboratory facilities are of sufficient size to meet instructional needs.

2. Tables and chairs are provided in order to give students ample room for learning activities.

3. The classroom is equipped with proper equipment needed for the type of instruction being provided.

4. The room has adequate blackboard and bulletin board space.

5. Storage facilities are provided for materials and supplies.

6. Suitable office space is provided the teacher coordinator for counseling purposes.

7. The teacher coordinator has access to a typewriter and duplicating machine.

8. Miscellaneous supplies such as stationery, stamps, and stencils are available to the teacher coordinator.

9. Selected films, filmstrips, projectors and other supplementary teaching aids are available.

10. The room is equipped with book shelving and files.

11. All equipment is maintained in good working condition.

12. Textbooks are available for reference in the classroom covering the materials needed by each student.

13. Such materials as charts, maps, posters, graphs, and business display materials are provided.

14. Current booklets, pamphlets, and leaflet materials from manufacturers, producers, and business groups are available for student study.

15. Newspapers, magazines, and trade journals are supplied for class use.

16. United States Government and state business education publications are provided.

17. Teacher prepared materials (such as study guides and work sheets) are available for use in the classroom.

18. Printed materials in the form of study guides, workbooks, and manuals are used by all students.

19. Students contribute materials such as samples of merchandise, trade journals, etc. for use in the classroom.

20. Teachers utilize teaching equipment in the classroom that is available on loan from local stores in the community.

21. A good system of cataloging and filing for instructional materials has been developed and is used.

22. Instructional materials are constantly kept up to date.

23. Instructional materials used are continuously evaluated on the basis of student needs.

DOCUMENT NOT AVAILABLE FROM EDRS 11p.

PROGRAM EVALUATION, *CURRICULUM EVALUATION, *HOMEMAKING EDUCATION, ADMINISTRATOR RESPONSIBILITY, HOME VISITS, HOME EXPERIENCES, TEACHER RESPONSIBILITY, *CITIZEN PARTICIPATION, SECONDARY SCHOOLS, ADULT EDUCATION, *EDUCATIONAL IMPROVEMENT,

One hundred and thirty students, parents, citizens, teachers, and school administrators attended five meetings to evaluate the homemaking curriculum, and recommendations or "challenges" were made to secondary teachers, adult teachers, and school administrators. Specific suggestions for home visits and home experiences are listed. It was recommended that a brief annual review be initiated to evaluate the program and consider new problems. (MS)

5 Nights - ~~23.4~~ 23.6

A TOTAL LOOK AT HOME ECONOMICS

Home Economics Education personnel in Pinellas County conducted a comprehensive evaluation of the present curriculum at a series of meetings in March. Individuals and panels discussed various aspects of the total program at four night meetings. Students, parents, citizens, teachers and school administrators participated in the open discussions which followed each presentation. Listening Panels composed of FHA girls, parents, citizens, teachers and school administrators reacted each night and turned in suggestions.

At a fifth meeting, committees representing all groups involved in the evaluation, read, discussed, and compiled the suggestions. Suggestions and recommendations were divided into the following categories:

Challenges to Secondary Teachers
Challenges to Adult Teachers
Recommendations to School Administrators
Home Visits and Home Experiences
FHA Suggestions

The committees also recommended that a brief review, organized along similar lines but held earlier in the school year, be initiated on an annual basis for the purpose of reviewing progress and considering new problems and suggestions.

A junior high school student serving on one of the Listening Panels remarked, "I never knew grown-ups spent so much time and effort planning and thinking about young people's needs and education. I thought before that schools and curriculum just happened. I didn't realize that so much went into planning the school program. You flattered me by asking me to come, but you also sincerely

wanted to know what I, as a junior high student, wanted to say about home economics. I've learned a lot. Thank you for letting me help."

Those concerned with Home Economics Education in Pinellas County are grateful to the many people who devoted so much time and effort to the evaluation. It is sincerely hoped that all who participated will share the views expressed by the junior high student and feel, personally, that it was a worthwhile experience.

The programs on the various nights were as follows:

March 17

Committee work on suggestions and recommendations to submit to various appropriate groups in the school system: Pincheta, Secondary, Curriculum Committee, Secondary Principals, etc.

CHALLENGES TO SECONDARY TEACHERS

1. Establish and initiate new and better approaches to home visits and other contacts with parents.

2. Establish and initiate more challenging and more student-involved home experiences. Stress management concepts instead of humdrum skills. Plan and work on home experiences for slow learners and for low-income level families.

3. Update own knowledge and get ready to help teach venereal disease and related sex-education in the county-wide pilot program next year. Home economics teachers should avail themselves of the opportunity to help with the VD pilot program either through individual school team teaching approach or by preparing themselves to lead supplementary discussion in regular home economics classes.

4. Become better informed about the total field of home economics, its historical background, the current trends, occupational opportunities, and implications for the future.

5. Be sure that as an individual teacher, and as part of the home economics education team, you project the image of a professional in your work--reflected by your interest-in people-approach, excellence in teaching, deep understanding of human beings and how they learn and change, and by your own warm and dynamic personality.

6. Teachers must accept the responsibility for pointing out vocational opportunities in home economics and related occupational fields. Starting at the junior high level, there should be some direction given to help orient girls to the dual roles that the majority will follow most of their lives--that of being homemakers and wage-earners. Stress must be placed upon the need for management skills, decision making, and a better understanding of the shifting value system and its relationship to the problems of a working mother.

7. Allstudents must be challenged. This means more work, fresh and different approaches, more individual or small group work, less reliance on text books and more reliance on references, self-developed teaching materials, and better planning. This also means improved pupil-teacher planning and evaluation.

8. Utilize adult television program in home economics classes as a resource for advanced skills and consumer buying. The schedule of topics to be taught could be circulated among secondary teachers and reports, either on a voluntary or an assigned basis, could be given on aspects of interest to the secondary school students.

9. Initiate a county-wide action research project to determine extent of youth's involvement in home and adult responsibilities. Results of the survey would help teachers to plan more realistic home experience, more meaningful class activities, and would form a sound basis for future curriculum revisions,

10. Home economics is a human relations oriented field. Special education reminds us that we teach pupils not subjects. Principals remind us that we set examples in our intra-departmental and intra-school faculty relationships. Parents and citizens remind us that we must meet the needs of people today and help youth and adults with today's problems.

CHALLENGES TO ADULT TEACHERS

1. Accept the responsibility for acquainting women with career and vocational opportunities utilizing home economics skills.

2. Incorporate more the managerial skills needed by working mothers into all home economics courses.

3. Intensify efforts to reach more newly married couples, young mothers, and working mothers. Home economics has a great deal to offer most of these people.

4. Broaden the scope of the adult program. Areas other than clothing and housing should be offered from time to time in updated and attractive course- packages.

5. People of all ages and all economic levels need to be able to turn to the schools for education and have their needs and interests met. Are we meeting the needs and interests of our adults?

6. Make better use of the WEDU television home economics programs by circulating program topics among adult teachers in advance. Correlate adult class work with special television programs whenever possible. Each can do much to enhance the other. Mrs. Lutz's new program on consumer economics could do much to spark interest in that area.

7. Work to up-date adult courses to include recent research findings and new pertinent materials.

8. Encourage more local control over course content and course titles. This is necessary if we are to pay more than "lip-service" to meeting the needs and interests of adults in different communities.

Suggestions to Principals and Administrators

1. Work toward a firmer and more uniform policy at junior high level requiring home economics at eighth level so that there are fewer girls who must take first year in ninth grade. If all eighth grade girls had home economics there would be less confusion at ninth grade level and the articulation would be improved.

2. Make Modern Family Living courses available at all high schools. Encourage boys to take it.

3. Encourage a coordinated approach between social studies and home economics to eliminate overlap and strengthen both social studies and home economics in interrelated areas such as Psychology, Modern Family Living, Personal Family and Social Relations semester courses.

4. Encourage a coordinated approach between guidance and home economics for better understanding of pupils. Students reported they were greatly helped when guidance people, home economics teachers and pupils held 3-way conferences on pupils' problems.

5. Encourage use of men from guidance, social studies and other fields as resource people or guest speakers in home economics classes in order to get the masculine viewpoint. So many children have no father in the home, they need to have a strong male influence injected in family life discussions.

6. FHA advisers need help at the high school level in resolving the FHA Chapter and semester course difficulties. As each school has its own school organizations set-up, a school community needs, the problems will have to be worked out at the local school level. The semester courses seem to be successfully meeting needs of high school students but they, in turn, are creating problems as to organizations, type of chapter, continuity, meeting time, etc. as far as FHA is concerned. In the adjusting of FHA activities and organization to the semester courses the adviser and officers will need the help and understanding of the principals in tailoring the program to the school.

7. Home economics teachers could work with physical education teachers as resource people in the teaching of health, grooming, and nutrition, in junior high school

8. Home economics teachers could be resource poeole in the teaching of health, nutrition, and food habits, grooming, home safety, and housing in the elementary school--as an enrichment of existing curriculum not an addition.

9. Explore with home economics education the possibilities for occupationally oriented home economics courses at junior and senior high school levels to interest and encourage many youngsters for whom high school will be terminal.

10. Encourage independent study in high school home economics classes and for fast learners in junior high.

11. In schools which have a seven period day, or when feasible, explore possibility of offering a boys home economics course to seventh or eighth grade boys in relationships and manners, food selection and simple cookery, clothing selection and care. Young boys need help, too, as well as girls.

12. Encourage and back all concerted efforts to secure top-notch current courses in different areas of home economics to be offered by nearby colleges, university extension services, or continuing university studies each year in the vicinity of the county. Also, support the effort to bring in resource people for up-dated in-service training.

Home Visits

1. If home visits are valuable to students, home economics teachers, and parents, then visits should be made regardless of grade level, reimbursement from state, or a required number. Visit when there is a real need-not just to fulfill a required number. Try to encourage invitations to visit homes. Avoid any pressure on the students or homes.

2. Recognize that some parents, homes, students do not want a visit made for many reasons. Try to find other wqys to meet, know and communicate with parents. Do not push home visits. Respect students' and parents' beliefs about home visits.

3. Be professional about home visits. Do not gossip about homes or people. Be sure parents and girls know purpose of visit. A letter at beginning of the year may help.

4. Home economics teachers need to re-evaluate ome visits and their tie-in with home experiences. Home visits are to help and guide home experience not to check a project.

Home Experiences

1. New ideas sho ld be creatively collected and tried. Home experiences should offer fresh and helpful approaches to present day living.

2. Home experiences should stress management and challenging involvement of students rather than acquisition of mechanical skills.

3. More effort should be expended in informing students and parents of purposes and satisfactions to be gained through home experience program. Emphasis should be placed on the challenge and the desire to do one and less on the ordinary routine and the requirement to do. More work needs to be done to sell parents on them as parents freqeuently are the limiting and discouraging factor due to lack of understanding or communication between teachers and home.

4. One question raised in the home experience discussion was, "Are we giving students enough training in using conveniences in the home to the best advantage?" Home economics should take a long look at conveniences, their use, and our teaching of their use.

5. Teachers should work on ideas and plans for home experience for girls who do not have equipment, facilities, materials, etc. These girls need help too. Home economics tends toward middle class approach to home experiences. We also have students from other economic levels and should consider their needs and interests.

6. Home experiences can give opportunity for slow learners to succeed.

7. Ways of reporting home experiences should be explored. Brief oral and simplified written reports should be tried. Involved written reports discourage and take away enthusiasm.

EDRS Price MF-$0.09 HC-$1.64 41p.

*VOCATIONAL EDUCATION, *TECHNICAL EDUCATION, *ADULT EDUCATION, POSTSECONDARY EDUCATION, *EDUCATIONAL PLANNING, UNEMPLOYED, DROPOUTS, EDUCATIONAL NEEDS, STUDENT ENROLLMENT, ENROLLMENT TRENDS, EMPLOYMENT STATISTICS, EMPLOYMENT TRENDS, STATE PROGRAMS,

Illinois,

The study committee presented its report to the Board of Higher Education for use in developing a "Master Plan" for higher education in Illinois. Included are -- (1) characteristics of Illinois' unemployed, (2) data on high school droputs, (3) the role, nature, and demand for adult and technical education, (4) a recommended plan for adult, technical, and semi-technical education, and (5) conditions for successful technical education in 2-year colleges. It was projected that -- (1) by 1970, 58,000,000 persons now at work and still employed will need training to keep pace with new methods, new materials, and new opportunities, (2) 26,000,000 young workers starting to work between 1960 and 1970 must match the needs of a changing economy, and (3) 3,000,000 women who will switch from housework to jobs will need marketable skills in the decade ahead. Illinois should provide new college level educational facilities and programs to enroll approximately 13,900 full-time and 13,200 part-time students at the technical level (2 years), and 43,000 full-time and 40,000 part-time students at the semi-technical level (1 year). V Desirable Enrollments in Post-High School Semi-Technical Curriculums in Public Institutions in Illinois 30

RECOMMENDATIONS

Committee H was concerned with adult education and with vocational and technical education at the college level. Its conclusions and recommendations appear below.

Adult Education

1. All educational agencies, both public and private, at all levels from elementary schools to universities and colleges, should provide greatly expanded services to a wider variety of adults. The responsibilities for adult education must not be limited to any one type or level of educational institution. The common schools, two-year colleges, and four-year colleges and universities must continue their efforts to raise the educational levels of our citizens.
2. Adult courses offered for credit should be restricted to subject matter, courses, and programs within the competence of regular full-time faculty members and the assigned functions of the particular institution.
3. Non-credit offerings should be somewhat independent of the interests and boundaries of any department, school, or college, in order to be flexible enough to meet the needs of various groups of adults.
4. Non-credit offerings in colleges equipped for technical and semi-technical education should include job-preparation courses for adults who have not graduated from high school.
5. Greater use should be made of representative educational planning and advisory committees in developing course content and curriculums in each of the areas of specialization.
6. Recognized leaders within the university staff, as well as those from industry, business, and the professions, should compose the adult education faculty for non-credit offerings.
7. State and regional advisory councils should be established for adult education. These councils should be composed of representatives of the public and private agencies concerned with the education of adults and should include representatives from such major administrative bodies as State Superintendent of Public Instruction, State Director of Manpower, the proposed Junior College Board, Board of Higher Education, State Board for Vocational Education, etc. These

councils would be advisory in nature, but would be responsible for the direction of research, experimental programs, and the continuous study and evaluation of programs.

8. Funds and staff should be provided for statewide research into the many facets of adult and continuing education, including a study of the present approaches and offerings in the state.
9. Funds for adult education should be included in the budgets of each of the colleges and universities (two-and four-year institutions) to insure the proper balance and emphasis on this function.
10. Adult education tuition and fees should be flexible in order that the education of groups such as the economically underprivileged, unemployed, and underemployed may be financed by state and/or federal funds.

Technical and Semi-Technical Education

The term technical education is used to mean education for employment in occupations in which two to three years of college-level technical training is essential. Semi-technical education prepares students for occupations requiring competence on advanced skill levels for which one to two years of post-high-school training is needed.

Committee H recommends the following:

1. College-level technical and semi-technical education leading directly to employment should be greatly expanded to meet the needs of business, industry, and services in Illinois for competent employees, and to develop the interests and talents of a large fraction of high school graduates, and of adults who need to expand their knowledge in their lines of work or to learn new fields of work.
2. A statewide system of regional, comprehensive two-year colleges, each with a division of technical education should be established as soon as possible. The plan for Illinois described by McLure and his co-authors may be taken as a tentative model for a statewide plan.[1] Plans for the system should take into account the present publicly supported centers of technical and semi-technical education.

[1] W. P. McLure, G. C. Mann, H. M. Hamlin, M. R. Karnes, and P. Van Miller, Vocational and Technical Education in Illinois. (Urbana: Bureau of Educational Research, University of Illinois, 1960).

3. The organization and administration of technical education in two-year colleges should include:
   (a) Technical education departments organized on the basis of occupational areas served.
   (b) A technical education division within the college, comprised of departments, headed by a director or dean who is responsible to the head of the college.
   (c) A regional board to operate each two-year college.
   (d) A state board to stimulate, accredit, and coordinate the work of all two-year colleges.
   (e) The State Board of Higher Education to coordinate the work of two-year colleges with that of other colleges and universities.
4. The capital and operating costs of the proposed statewide system of comprehensive two-year colleges should be financed entirely at the state level, except for federal support and student tuition and fees. It is believed that problems of high quality, efficient concentration of enrollment, and the attendance by some students at colleges in regions in which they do not live, can best be met by vesting substantial control and insuring full financial support at the state level.
5. Tuition and fee charges should be uniform in all public two-year colleges and in all curriculums.
6. Though the central function of the technical division of a two-year college is offering college-level programs to high school graduates, a secondary function should be to provide educational services to persons beyond high school age who are not high school graduates. Some examples of such services are the following:
   (a) Vocational guidance and counseling.
   (b) Placement in college-level programs on the basis of proven ability, aptitude, and readiness.
   (c) Non-credit courses in preparation for specific jobs.

   Another possible service is the sharing of technical facilities and equipment with local high school vocational programs.

INTRODUCTION

Accelerating technological and scientific developments resulting in the introduction of new materials, processes, and products are radically affecting every phase of human endeavor. Because

of the unparalleled technological developments taking place in industry, business, agriculture, and the professions, present educational facilities and programs are no longer adequate to meet the increasing demands for technical and semi-professional workers between the skilled and professional levels of employment, requiring specially planned college-level education of less than the usual four years. These vast changes and their corresponding effect upon manpower needs have also resulted in an ever-increasing awareness among adults of all ages, education, and social backgrounds of the need of continuing education.

However, realistic planning for an effective educational organization of the future is not possible without a review of the school drop-out rate and unemployment ratio and educational level of our youth and adults. Therefore it is the purpose of this report to evaluate the pertinent statistics for Illinois, to examine the ultimate function of technical and adult education, and to make recommendations for the framework of these facets of the total educational pattern.

Characteristics of Illinois' Unemployed

One of the most serious problems facing our state and nation at the present time is the increasingly high percentage of unemployed. In June, 1961, Governor Kerner established a committee on unemployment composed of representatives from labor, government, and the educational institutions "to examine unemployment in our State, determine its characteristics and causes, assess the techniques currently used to meet the problem, and recommend additional steps that should be taken."

The committee found that unemployment today is largely a problem for the unskilled worker, the one with obsolescent skills, the young worker, and the non-white.

A special Job Seekers Survey made by the Illinois Department of Labor showed the following characteristics of the unemployed in Illinois:[2]

1. They have completed fewer years of schooling than has the average adult in the state (Table I).
2. They have been unemployed for a long time—45% of the state's job-seekers (August, 1961) had been unemployed for five months or longer.
3. They have been largely employed in manufacturing.
4. Almost 30% of them are non-white, but their representation in the labor force is only a little over one-third as high.

[2] Report of the Governor's Committee on Unemployment-Illinois, January, 1963, Chap. I, The Unemployed, pp. 5-11.

5. They are generally (71%) willing to take training. Only 35% are willing to relocate. More job-seekers in non-metropolitan area counties than in metropolitan areas are willing to move to get new jobs.

The committee also found that the average adult has completed about ten and one-half years of schooling, which is about average for our country; however, the number of adults in Illinois who have completed four years of college as a whole is 5% lower than the national average.

There have been sizable shifts in the composition of the labor force of our nation during the past decade. The greatest rate of increase has occurred in the professional, technical, and salaried manager groups, and largest rate of decrease in agriculture, mining, and transportation occupations, particularly at the unskilled and semi-skilled levels. Each of these changes indicates the need for longer school retention and improved programs of education closely geared to changing job requirements. Manpower studies also clearly indicate that high school graduation is no longer enough and that more young people must be encouraged to continue their education beyond high school.[3]

The school enrollment of the 14-22 age group in Illinois, shown in Table II, indicates the seriousness of the school drop-out problem at both the high school and college level. A careful analysis needs to be made of these drop outs. Committee B's report on college-level drop-outs should be considered as part of the total solution of the unemployment problem and the future educational program, particularly in the two-year colleges and technical institutes.

TABLE I

Years of Schooling Completed by Unemployed and Employed Workers, Illinois, 1960

Years of Schooling Completed	Per Cent	
	Job Seekers	Adult Population
7 years or less	16.7	19.1
8 through 11	51.0	41.5
12 (generally, high school graduation)	25.0	24.5
13-15 (some college)	5.8	8.6
16 or more (generally college graduation or more)	1.5	7.3

[3] U.S. Department of Labor, Manpower, Challenge of the 1960's, 1961.

This does not imply that raising the educational standards alone is a panacea for the nation's unemployment. However, there is much evidence to indicate that a higher level of functional education would greatly reduce unemployment. First, it is known that many jobs are unfilled because of a lack of qualified job-seekers (the scarcity of teachers, to mention one). An examination of "help wanted" advertisements will show practically no calls for "young men willing to do any kind of work." There will be many calls for men capable of doing some specific job such as electronic technician, engineer's aide, medical technologist, accountant, draftsman, secretary, etc. Second, through education and research many new products are developed and new jobs created for those who possess the essential skills and know-how. Thus economic growth is stimulated and unemployment reduced.

High School Drop-Outs

Planning for adult, vocational, technical, and continuing education must take into account that segment of the population which has not graduated from high school, commonly referred to as "drop-outs." These people make up the largest portion of the unemployed. They have the fewest skills and usually are weak in the basic educational requirements prerequisite to further vocational or technical training.

The best available data indicate that currently the four-year drop-out rate for high school students in Illinois is about 31%. A study by the Office of Education of the U.S. Department of Health, Education, and Welfare for the school year 1959-60 reported the drop-out rate for Illinois to be 30.5%. A report by the Illinois Association of School Boards shows 40,436 drop-outs (32%) for the graduating class of 1961 and 37,467 (31%) for the class of 1962.

Drop-out rates vary widely among school districts, ranging from a low of 10% to a high of 50%. The accompanying map shows the percentage of drop-outs by counties as tabulated in the report of the Illinois Association of School Boards for the graduating classes of 1961 and 1962.

The Report of the Governor's Committee on Unemployment - Illinois, published in January, 1963, contains an interesting and informative section on drop-outs. Quoted here are several excerpts:

- - - - holding young people in school

A major task of the schools, keeping students through high school graduation, is a massive assignment; the size of this task comes as a disquieting surprise to people first meeting

Tabulation of per cent of high school drop-outs by counties. Data from report by Illinois Association of School Boards.

Top figures shows per cent for the four-year period 1957-61. Bottom figures are for 1958-62.

Freshmen 1957-8	High School Graduates 1961
126,706	86,270

Per cent of Drop-outs, 32

Freshmen 1958-9	High School Graduates 1962
120,206	82,739

Per cent of Drop-outs, 31

TABLE II

ILLINOIS SCHOOL ENROLLMENTS - HIGH SCHOOL AND COLLEGE AGE[a]

Age	Total Population		Number Enrolled In School		Number Not Enrolled In School		Per Cent Enrolled In School	
	Male	Female	Male	Female	Male	Female	Male	Female
14	71,044	68,259	67,752	65,162	3,267	3,070	95.4	95.5
15	70,907	69,637	66,501	65,143	4,396	4,529	93.8	93.5
16	74,585	73,245	65,363	63,454	9,252	9,819	87.6	86.6
17	78,532	75,981	59,169	57,050	19,409	18,915	75.3	75.1
18	66,073	66,123	34,563	28,681	31,523	37,404	52.3	43.4
19	54,675	61,211	19,685	15,556	34,996	45,688	36.0	25.4
20	51,713	60,735	14,051	10,929	37,607	49,788	27.2	18.0
21	55,809	62,776	13,194	7,999	42,713	54,985	23.6	12.7
22	56,245	62,056	10,207	4,220	46,185	57,839	18.1	6.8

[a] U.S. Bureau of Census, U.S. Census of Population: 1960. General Social and Economic Characteristics, Illinois. Final Report PC (1) - 15 C, 1962.

the problem. The year, 1950, was the first year in which half of those who had started fifth grade eight years earlier were graduated from high school; even today only about 60 per cent of all fifth graders remain in school until high school graduation and only two-thirds of those who start high school, graduate.

The consequences for those who do not achieve this level of schooling will undoubtedly be more serious than ever before. Lack of high school education is an almost total bar

to entering a profession,
to getting a white collar job,
to becoming an apprentice,
to entering government service except at the janitorial level.

There are, in fact, few employment opportunities for young people without a high school diploma except in the dead-end, low-pay jobs, particularly those of the service, trade and transportation industries.

Determination of the size and nature of the drop-out problem is the first step towards its solution — and a step that is surprisingly difficult to take. Despite the hundreds of studies that have been done on this problem, there are no comprehensive and continuing statistics showing the percentage of children who drop out at the various levels of school. We suggest therefore, that there is an immediate need to institute, in every school district of the State, collection and publication of accurate statistics on the number and percentage of drop-outs in each school grade. We further suggest that all such information be coordinated by the Superintendent of Public Instruction. This type of information will permit much more effective planning to solve the problem of drop-outs than information obtained from occasional and random studies.

There is now available better information on the rate of drop-outism in the separate states than has existed before; a recent study by the Office of Education of the U.S. Department of Health, Education and Welfare showed the percent of public high pupils who did not graduate four years after enrollment in high school. The range was from 17.8 percent for Hawaii to 42.3 for Alaska. Twenty-seven states had a higher drop-out rate than Illinois. The following is a ranking of the states by their drop-out rates, 1959-60:

State	Per Cent Not Graduating from High School	State	Per Cent Not Graduating from High School
Alaska	42.3	Kansas	31.0
Georgia	41.9	Delaware	30.5
Virginia	41.9		
Kentucky	41.6	ILLINOIS	30.5
Tennessee	41.2		
Nevada	40.9	Rhode Island	30.4
New Mexico	40.9	Colorado	28.6
S. Carolina	40.9	Pennsylvania	27.9
Louisiana	40.7	Washington	27.8
Mississippi	40.4	Idaho	27.7
N. Carolina	39.9	Montana	27.7
Alabama	39.3	Ohio	27.5
Texas	39.0	Connecticut	26.9
Maryland	38.1	Massachusetts	26.8
W. Virginia	37.9	New Jersey	26.0
Arizona	36.7	Michigan	25.9
Arkansas	36.7	Oregon	24.7
New York	35.0	S. Dakota	24.3
Florida	34.5	Utah	23.8
Vermont	33.6	Wyoming	23.3
Maine	33.5	Iowa	23.2
Missouri	33.3	Nebraska	22.5
Oklahoma	32.6	N. Dakota	21.4
Indiana	32.4	Minnesota	21.0
N. Hampshire	31.5	California	20.5
		Wisconsin	18.3
		Hawaii	17.8

Additional information is also available for Chicago. A study by the Office of Education of school holding power in large cities showed a total drop-out rate of 45.3 percent for a four year period for the three cities of New York, Chicago and Philadelphia. This included both voluntary and involuntary withdrawals, involuntary being defined as those over which the school presumably has no control. These include being drafted into the armed forces, physical disability, and being uneducable or institutionalized. The bulk of the losses were due to voluntary drop-outs, 84 percent of the total withdrawals. It is with this group that we are principally concerned, although a continuing watch needs to be kept over involuntary withdrawals: "uneducable" is an elastic label and its

widespread use will merely change the name of the drop-out problem, not alter its severity.

In Illinois the Chicago public schools report the rate of annual drop-outs, both voluntary and involuntary. In 1960-61, 15,658 children dropped out of high school, 13 percent of the total adjusted enrollment for the year. The true four-year holding power of the city schools is much more difficult to calculate because of extensive transferring. It seems likely, however, that the drop-out rate is not too far off from the national one for large cities.[4]

Summary

A significant number of students, approximately 30%, are dropping out of Illinois high schools before graduation.

Many of these people will desire and need to continue their education by returning to school for vocational, technical, and general programs. Often they will find it difficult, impractical, and even impossible to return to high school.

ADULT EDUCATION

The Role of Adult Education

The changes in our way of life have resulted in an increasing awareness among adults of all ages, education, and social backgrounds of the need for continuing education. Such a perspective is essential in our society, which is committed to democratic processes and ideals; every citizen in a democracy must have the opportunity to seek the rewards of productive work, both economically and socially. Educational institutions at all levels must exert more leadership and responsibility for the education of adults.

The Nature of Adult Education

The committee has defined adult education to include any continuing education for out-of-school youth and adults in courses and programs related to personal, vocational, cultural, or social interest or need. The courses and programs may be credit or non-credit, formal or informal; however, they are primarily a part-

[4] Report of Governor's Committee on Unemployment-Illinois, January, 1963, pp. 75-78.

time activity. Such education should encompass persons of all educational levels, from those lacking a basic common school education, to those with a high level of formal education. It must include:

1. Persons desiring to raise the level of their basic skills, complete high school work or its equivalent, obtain college work, or re-enter an interrupted college program on a part-time basis.
2. Those who wish to supplement or bring up to date a completed degree or certificate program.
3. Those who are upgrading themselves to meet the new technological requirements of their present employment.
4. The unemployed who need training.
5. Those who are interested in cultural, recreational, civic, and social activities.

Adult education is so unlimited that this report must necessarily be limited to those of its phases that seem related to the educational systems in the state. This does not minimize the importance of the contribution made by other organizations and associations in the field.

In addition, the area of specialized or concentrated job training for adults is of such great importance that it will be discussed in another section of the committee report. Furthermore, since it is difficult to define precisely the limits of adult education in relation to job training and other phases of education, there is necessarily some overlapping.

The Demand for Adult Education

National statistics reveal an alarming deficiency in our educational accomplishments:[5]

1. Our nation includes 11,000,000 adults, age 18 and over, who find it impossible to learn marketable skills because they cannot read or write as well as the average fifth-grader.
2. There are 58.6 million adult Americans who have not finished high school, and every year work opportunities dwindle for them. In addition, high school graduates are now being replaced by machines.
3. Leisure time, created by a mushrooming population of retired men and women and a shorter work week for younger workers, has resulted in a frustrating and disappointing experience for millions of adults.

[5] Robert F. Schentz, "Undereducated Adults," NEA Journal, January, 1963, pp. 18, ff.

4. The nation's divorce statistics and high rate of juvenile delinquency and crime are undeniable proof that many people marry and raise children without adequate knowledge of how to cope with the problems of family living and ability to get along with others.
5. The average voter, confronted with problems infinitely complicated, has difficulty becoming well informed without outside help. Hence, millions are ill equipped to make intelligent decisions.

However, these same statistics also indicate that of these millions of undereducated adults:

1. Approximately 449,000 men and women are finishing elementary high school in public school adult classes. An additional 932,000 adults attend public school, business, trade, industrial and technical courses. This total, 1,381,000, represents about 2% of the nation's undereducated 58.6 million.
2. To offset No. 5 above, approximately 75,000 adults take part in civic-public affairs activities organized by their public schools; another 171,000 are learning the rights and responsibilities of citizens through Americanization classes.
3. 132,000 adults (both men and women) attend parent education classes; 71,000 adults participate in personal development and group relationship classes, and 459,000 attend public school courses in homemaking.
4. A recent seven-state survey revealed that California, New Jersey, and New York have the greatest number of senior citizens (almost 64,000) participating in general adult education classes. In addition, vocational courses are available to adults in thousands of public schools in the United States; some more progressive communities are also offering adult courses for retirement.[6]

The Governor's Committee on Unemployment report indicates that employment has become identified as a problem of the unskilled worker or the one with obsolescent skills. It appears that upgrading, training, and education are related to the economic situation and to public aid as well as to personal development of the individual. In addition, there is a current general increase in educational requirements for many jobs; more job opportunities depend upon a high school diploma or its equivalent. Therefore, it is imperative that those adults who have not completed their secondary education, those who need retraining, those who desire additional training, and the many who wish a fulfillment of special

[6] Ibid.

interests be provided adequate educational opportunities through the facilities of the educational institutions of the state.

Basic Plan for Adult Education

A. Colleges and Universities

There has been a trend for many colleges and universities, both two-year and four-year, to offer a vast array of courses for adults, depending upon their own areas of special competence. This array includes extension, extended day, evening school, continuing education, or whatever form and title adult education takes. These excellent opportunities for continued learning are presented in both credit and non-credit courses.

This report is limited to a general discussion of needs and plans for adult education. The Committee on Extension and Public Service has, in its preliminary report, described in considerable detail the present programs and plans of the colleges and universities of Illinois. The report includes an account of the highly successful Cooperative Extension Service operated as a part of the land-grant system of the University of Illinois. It is principally a non-credit offering of informal adult education to rural and urban citizens, made available through a corps of extension personnel distributed throughout most of the state.

A recent nationwide survey by the Center for the Study of Liberal Education for Adults indicated that over 17 million Americans were enrolled in some type of adult education course between June 1, 1961, and June 1, 1962. An additional 9 million were engaged in some form of independent self-education. The major stress of adult education, according to this survey, was found to be practical, rather than academic, emphasizing skills rather than "knowledge."[7]

Many adult students are enrolled in part-time evening programs for which regular college credit is granted, leading either toward specific degrees or toward meeting special licensing, certification, or professional requirements. Special services offered by colleges and universities, especially those in metropolitan areas, include non-credit "community service"-type courses. More complete utilization is thus made of the knowledge and talent of the university staff and the college facilities for conferences, workshops, seminars, and short courses. Many of these non-credit offerings are conducted on academically sophisticated and professional levels. Colleges and universities typically employ two patterns in continuing adult education.

[7] Center for the Study of Liberal Education for Adults, Survey of Adult Education 1961. (Chicago: The Center, 1963).

1. The college campus drive-in or residential plan—service provided in the regular concept and connotation of the campus setting.
2. The retreat plans of 30-50 universities that provide their continuing adult education in the natural and rural beauty of country lodges remote from the noise and tension of large cities and metropolitan areas.

Whatever the environment provided for this type of adult education, one fact predominates: there is a need for greatly expanded residential education offerings for various groups and associations such as bankers, businessmen, secretaries, lawyers, doctors, labor leaders, service-type (restaurant, motel, etc.) personnel, transportation personnel, and many others. These courses can be especially valuable:

1. If they are somewhat independent of the limiting interests and boundaries of any department, school, or college. The resulting flexibility would be highly desirable.
2. If representative educational planning and advisory committees in each of the areas of specialization are utilized for development of course content and curriculums.
3. If recognized leaders within the university staff are supplemented by those from industry, business, and the professions in the adult education faculty.
4. If the administrative and supervisory staff is adequate to maintain effective supervision of instruction and instructional materials, and to expand effectively the scope of the offerings.

If this educational framework can be established and maintained, the impact of adult education, as a facet of university offerings, will be statewide, and even national in some instances. It will:

1. Build a favorable image and strengthen public relations.
2. Provide education for upgrading of personnel on all levels.
3. Educate the public about the expanded functions of a university.

B. Public Schools

Historically, the heart of the adult education enterprise has been the local public school district. The role of the public school for this purpose is both logical and obvious. The public school is, first of all, publicly supported by the same adult population that

requires its services. Second, the public school has existing plant and personnel to teach and administer programs for adults. Third, it is an acceptable and inexpensive facility for all adults. Fourth, as a recognized local educational resource, the public school is able to provide educational leadership to other educational activities for adults through a variety of relationships in the community. Many aspects, however, contribute to the current failure of local schools to meet the demands for adult education:

1. Programs of adult education must be administered, supervised, and taught with different objectives from those on an elementary or secondary level. Hence, many times the available staff is untrained.
2. Local budgetary limitations obviously restrict the scope of offerings.
3. Many public school districts are too small or too remote to offer adult education programs.

This does not mean that a vast amount of exceptionally valuable adult education is not, or cannot be, handled through public school facilities. However, the conditions affecting these offerings are similar to those noted above for university and college programs.

C. Other Agencies

Many local agencies (YWCA, YMCA, art centers, theater groups, music appreciation groups, etc.) provide outstanding programs that are available to the public. These activities are not only a social outlet for the participants, but they influence the cultural level of the community, thus functioning as another facet of adult education.

D. Educational Television

The use of instructional television in the Chicago junior colleges shows that courses at this level can be taught effectively to a home audience by this medium. It brings into the educational system a new and older group of students who are strongly motivated to continue their education but who have been kept from doing so by various circumstances. Once started in higher education by television, they are likely to continue to a junior or senior college degree. Because of the high motivation of mature students, nearly two-thirds (65%) of these students finish their courses and take final examinations.

A highly effective junior college course can be planned, organized, and presented on television. An effective classroom teacher can learn to be an effective television teacher, but this requires time and preparation. When evaluated by techniques of measurement and analysis, television instruction is found to be a thoroughly effective means of extending college opportunities.

Students may achieve as much through television as in the conventional classroom groups. Many students take courses concurrently on television and in the classroom. Some students have received the Associate in Arts degree for work done entirely by television. Two-thirds of television students have indicated a plan to graduate from the two-year college. Most of those who succeed with the television courses seek to register for more courses the following semester. Many are prospects to fill the ranks of the teaching profession, particularly women with declining home responsibilities.

The use of television spreads existing facilities to take care of more students but may have the net effect of requiring more classroom space and more personnel time because it builds an appetite in the community for more higher education. The cost of educating credit students by television in large numbers is comparable with the costs of classroom instruction.

New courses need to be introduced each semester to maintain over-all enrollments. Since enrollments usually drop for the second semester of two-semester sequences, it seems best to offer courses on television for only the first semester and give the second semester in the classroom. Non-credit enrollments approximate three times the number enrolling for credit. Credit enrollments tend to be high in courses required for the Associate in Arts degree. Non-credit enrollments tend to be high in the skill courses in language, mathematics, and business fields.

Summary

The magnitude of the educational job ahead is staggering when the employment pattern is examined. The President's Panel of Consultants on Vocational Education[8] reports that by 1970, 87,000,000 will be in the full-time labor force, consisting of:

1. 58,000,000 now at work who will still be employed and will need training to keep pace with new methods, new materials, new opportunities.
2. 26,000,000 young workers starting to work between 1960 and 1970. Their aptitudes, skills, and education must match the needs of a changing economy.
3. 3,000,000 women who will switch from housework to jobs will also need marketable skills in the decade ahead.

[8]Report of Panel of Consultants on Vocational Education, Education for a Changing World of Work, Office of Education Publication No. 80021, Washington, D. C.

The urgency of adult education becomes obvious when present and future occupational, social, and cultural needs are placed in proper focus. It is imperative that proper steps to meet these needs be initiated immediately.

TECHNICAL AND SEMI-TECHNICAL EDUCATION

The Role of Technical and Semi-Technical Education

As a consequence of the accelerating technological revolution there is an increasing need everywhere for trained and educated people. The demand is great at all levels of education but the concern of this section is education for technicians, business and office workers, skilled craftsmen, and other categories of workers whose fitness for their work can be greatly improved by one or two years of specially planned college-level education.

Fortunately, the interests of youth and of the state and nation coincide in a first-rate program of technical education. Every high school graduate should have the opportunity to prepare for a job commensurate with his interests and talents. The number of job opportunities for young men and women without specialized skills and knowledge is steadily decreasing. At the same time, Illinois and the nation must have many more and better trained workers to maintain their positions in national and world competition. The need for expansion of technical education has been documented in state and national studies and reflected in federal programs to support technical education in the states.

The crucial role of vocational and technical education in solving the employment and economic problems of Illinois is discussed at length in the recent comprehensive report of the Governor's Committee on Unemployment. The following quotations illustrate the point of view and recommendations in this important study:

> As society becomes increasingly industrialized and scientifically oriented, the relationship between education and industrial processes grows closer. Advancing technology not only substitutes more productive for less productive processes; it substitutes more productive people for less productive ones. And education and training are the basic means of raising the individual's productivity and thereby keeping him at work. . . .
>
> Just as advancing technology created the need for technicians functioning as the bridge between creative engi-

neers and scientists and the production men, so do the expanding needs of business, government, educational institutions and industry call for better educated and more knowledgeable assistants. Today the minimum educational qualification for clerical and sub-professional occupations is high school graduation; the average requirement is higher and in the process of rising . . . .

There is now a considerable body of evidence showing that since the turn of the century only about half the nation's increased output has been due to increased expenditures on capital and equipment; the other half has resulted from increased education — more skilled labor, greater amounts of research resulting in technological advance and improved management techniques . . . .

We recommend that technical education be established either in technical institutes or in junior colleges with technical curricula and coordinated with regional vocational schools which would be within easy commuting distance of almost every one in the State", and again, "We strongly urge that planning for establishment of junior colleges be linked with planning for technical institutes and vocational education centers, so as to achieve the most economical and effective system.[9]

The national projection of employment by major occupational groups, 1960 to 1970, by the U. S. Bureau of Labor Statistics is shown in Table III. The noteworthy feature is that the occupations in which demand for workers will rise faster than average are the ones in which the most education is required: professional and technical workers and clerical and service workers. The fraction of the total work force in occupations requiring the least education will decrease.

The most comprehensive study of the need for expanded vocational and technical education in Illinois was completed in 1960 by the Bureau of Educational Research, College of Education, University of Illinois, for the Office of the Superintendent of Public Instruction. The data and conclusions for Illinois in this report are based primarily upon that study. Although these data are for years preceding 1960, it is evident that developments in recent years are not keeping pace with the increasing needs for technical

[9] Report of the Governor's Committee on Unemployment-Illinois, January, 1963, Chap. IV, Education and Training, A Cornerstone, pp. 66, 96, 97.

TABLE III

Employment by Major Occupational Group, 1960 and Projected 1970

	Employment				Change 1960-70

[a] Projected by U.S. Bureau of Labor Statistics.

education in the state. The analyses and proposals in the study, though calling for a great leap forward, are conservative in relation to the needs of the state for post-high-school technical education and to developments in other states with comparable economic base and levels of industrial activity.

Following the study referred to, the major occupational categories may be classified in four groups on the basis of the amount of formal education required:

1. Professional - occupations that require extensive periods of formal education (four to eight years).
2. Technical - occupations for which two to three years of college-level technical training is essential.
3. Semi-technical - occupations requiring competencies on semi-technical or advanced skill levels and for which one to two years of post-high-school training is usually needed.
4. Vocational - occupations for which training may be given as a part of a high school program.

It is not easy or necessary to draw sharp lines between these groups. This section, however, is primarily concerned with evaluating the needs of the state with respect to Groups 2 and 3, namely, occupations requiring technical and semi-technical education, and with outlining a basic plan to meet these needs.

The Nature of Technical Education

Typical occupations that require the technical level of education include those of engineering technicians; architectural and structural draftsmen; medical, dental, and scientific technicians; production technicians; business specialists of many kinds; technical specialists in agriculture and related industries; and many others. These fields are characterized by a special application of knowledge from the basic fields, such as mathematics and science. Preparation includes not only specialized courses in the techniques of the occupation but also a body of general and related knowledge. The standard of performance in these occupations includes a considerable degree of flexibility and resourcefulness.

The McLure study describes or lists the contents of a number of one- and two-year curriculums in industrial, business and agriculture-related programs.[10] As a sample of a high-level technical program, an Electronic Technology curriculum is given below.

[10] Ibid, pp. 51-74.

It is one of a series of curriculums prepared and described in detail by groups of engineering educators and practicing engineers under the auspices of the U. S. Office of Education.[11] It is not a pre-engineering curriculum. A graduate of this curriculum will have a good foundation in the principles of electronics and considerable facility with the "hardware" encountered in the electronics industry. It is assumed that the entering student will have graduated from high school in a program that includes two to three years of mathematics, a year of physics, and a year of chemistry.

The Demand for Technical Education

Industry in Illinois is highly diversified, and the industrial trends in the state are remarkably like those in the nation as a whole. With one exception (textile mills), the top ten industries in the nation are the top ten in Illinois. Hence, a statewide program of technical education proportioned to meet the needs of Illinois will also correspond to national needs for trained men and women. It will prepare Illinois youth to adapt to the mobility of population and the changing requirements of industry that characterize the economic development of the nation.

Accurate estimates of the work force requiring technical education are difficult to make. McLure and his co-authors, assuming that the need in Illinois for additional workers and replacements in each of forty major occupational fields parallels the national need in these fields, came out with the following numbers of graduates of vocational and technical curriculums, needed annually in Illinois in the mid-1960's:[12]

Technical level (2 years college)	20,366
Semi-technical level (1 year college)	44,745
Vocational level (high school)	47,539

To show that these numbers are conservative, the estimated numbers needed annually in the 1960's for replacements and additions in a few occupations are related below to an assumed Illinois population of 10,000,000 and a gross state product of 40 billion dollars (approximately 7 per cent of current GNP).

[12]McLure et al., op. cit., Chap. II.

Occupation	Number of NEW Trained Persons	
	Needed annually in Illinois	Needed annually in Illinois per 10,000 population, or per $40,000,000 gross state product
Engineering Assistants	2790	2.8
Technicians (Medical, Dental, Scientific)	890	.9
Accountants	2340	2.3
Purchasing Agents	280	.3
Office Workers	15740	15.7
Printers	1350	1.4
Cosmetologists and Barbers	1540	1.5

The estimated numbers of new workers needed are also conservative in that not all occupations are included. It should also be emphasized that the enrollments in any year should be about three times the number of graduates needed.

Accurate and comprehensive figures of current enrollments and graduations in organized occupational curriculums are not available but the following figures will show that in Illinois they fall far short of the above estimates of the numbers needed.

In Illinois, in 1958, approximately 8,700 full-time and 3,100 part-time students were enrolled in organized occupational curriculums, in both public and private post-high-school institutions; the number of graduates in 1958 was about 2,600.[13] Unpublished data assembled by the same source show that the numbers did not change appreciably between 1958 and 1960.

The enrollment in engineering-related technical education programs in Illinois which are partially supported by federal funds under the National Defense Education Act (Title VIII) has increased from 441 in 1959 to 1,835 in 1963 (full-and part-time). These include some high school programs. Illinois does not at present have the basic facilities and programs with which to expand its technical education. Under Title VIII, the federal government will provide fifty per cent of the operating costs, on a matching basis, for programs in engineering technology and some other areas. In 1961, $375,000 was allocated to Illinois but only $168,000 was claimed and used.

[13]Organized Occupational Curriculums in Higher Education, U.S. Office of Education Circular No. 632, 1958.

At all events, it is apparent that the enrollments in technical education in Illinois are very far below the numbers needed to produce the 20,000 graduates from technical curriculums, and 45,000 from semi-technical curriculums, who could effectively be employed annually in Illinois.

In their study, McLure and his associates made a second estimate of the need for technical education in Illinois,[14] this time expressing the results in terms of a desirable plan for public technical education. For this estimate it was assumed that by 1965 or 1970, Illinois should aim approximately for the per capita enrollments in technical education that California had attained in 1957, namely, 20 full-time and 14 part-time students per 10,000 gross population. In the same year, 1957, the corresponding numbers in Illinois were 6 full-time and 3 part-time students per 10,000 population.

California and Illinois are similar in population, industrial development, distribution of occupations, and average per capita income. Each has special strategic factors that contribute to its position in the American economy. California has a big lead, however, in providing many kinds of technical education that are of great importance in the rapidly developing technology of industry and business and in public and private services.

In this second estimate, after allowing for an enrollment of about 5,000 full-time students in the private technical colleges and institutes, the calculations led to needed enrollments in public institutions at the technical level of 13,887 full-time and 13,190 part-time students. The plan for distributions of these students among the necessary curriculums will be discussed later. This goal for 1965 or 1970 is a much more modest one than that implied by the earlier estimated annual need of approximately 20,000 graduates in technical education. The curriculums typically require two years of full-time attendance. Taking account of drop-outs and part-time study, the annual number of graduates in the second estimate would be less than one third of the annual enrollment, perhaps 6,000 to 8,000 per year. Assuming an additional 2,000 graduates from the 5,000 enrolled in private institutions, the total number graduated annually would be about 9,000, or less than half of the estimated 20,000 additional workers and replacements needed annually in 1965. These figures are rough estimates but they are conservative and show that even with this very large increase in numbers enrolled in technical education, at least half of the needs of the state for technical workers would have to be met by on-the-job training, or by bringing in technically trained personnel from out of the state.

[14]McLure et al., op. cit., p. 48, and Appendix C, p. 147.

The Demand for Semi-Technical Education

The semi-technical level of occupation includes mechanics and repairmen for office machines, computers, machinery, transportation equipment, radio and television; structural metal workers; operators and maintainers of heavy machinery and equipment; automotive specialists; skilled craftsmen who require post-high-school education, in some cases as a part of apprentice training; general business assistants; farm service technicians; aircraft maintainers; laboratory assistants; and many other categories.

The diversity of such occupations is very great and it is not easy to define the boundaries of the group. The essential characteristic of the group is that the formal education required cannot ordinarily be completed in a vocational program in high school, but can be accomplished in a year of concentrated post-high-school study. As compared with technical education, there is less emphasis on cognitive knowledge and more on manipulative skills.

As noted above, the McLure study concluded that the annual number of workers at the semi-technical level of training needed in Illinois in the mid-1960's is approximately 45,000. Current enrollment figures in college-level semi-technical education in Illinois are not available. It is safe to say, however, that such enrollments are a very small fraction of the numbers of trained persons needed annually.

Recommended Plan for Technical and Semi-Technical Education

McLure and his co-authors identified 44 curriculums in technical education most important for Illinois and distributed the numbers of students given above (approximately 13,900 full-time and 13,200 part-time) among the curriculums in proportion to the relative need for new workers and replacements in the various occupational fields. They also proposed a reasonable number of centers in the state in which each curriculum should be offered, on the basis that efficient and economical operation requires that the enrollment in a curriculum should be at least 50 full-time and 60 part-time students, or the equivalent. The results of this distribution, given in Table IV[15] are the basis of a plan for technical education which would bring Illinois to the level attained by California in 1957.

A plan for the distribution of semi-technical education among centers is given in Table V.[16] Here 32 curriculums are identified as most important in terms of numbers of workers required. Since enrollment data in the nation or in individual states are not

[15] Ibid., p. 85, Table 21.

[16] Ibid, p. 87, Table 22.

available, the most important consideration in determining the desirable enrollment is that the estimated number of semi-technical workers needed is two to three times the number of technical workers. It is also assumed that education of this kind will not be available in private institutions. The total enrollments in semi-technical education proposed in Table V are therefore approximately 43,000 full-time and 40,000 part-time.

The proposed enrollments in Table V are for the state as a whole. The numbers of centers in which the curriculums should be offered, however, are given only for the part of the state outside of metropolitan Chicago, that is, in the areas where compromise between an efficient enrollment and distance from the center may be necessary.

The McLure study did not intend to describe in detail a plan for technical education in Illinois. Changing industrial technology, for example, will require new curriculums and different emphasis among curriculums. Studies are underway to secure more accurate data on the needs for specific kinds of training and on the development of curriculums to meet up-to-date needs. The University of Illinois and Danville Junior College, for example, are making a detailed survey of the need for engineering technicians in Vermilion County. Tables IV and V, however, do give a clear picture of the scale on which public technical and semi-technical education at the post-high-school level must be organized, if even half of the workers in these categories needed annually in the state in the middle 1960's, are to be educated.

Conditions for Successful Technical Education in Two-Year Colleges

If the two-year colleges are to meet successfully the comprehensive educational needs of high school graduates and adults, they will need to serve a number of purposes including the following: (1) Providing courses appropriate to the first two years of baccalaureate degree programs; (2) Offering a wide variety of curriculums designed to prepare students, in a period of approximately two years or less, to meet the entrance requirements of technical and semi-technical occupations needed in the region, state, or nation.

Committee H here calls attention to an excellent statement of conditions that must exist if technical education is to succeed:[17]

1. The administration of the college must be clearly committed to the idea of providing occupationally oriented programs for those youth who are not planning to go into a four-year college and for adults already employed in the region.
2. The administration and faculty of the college must fully accept, as a major task of the institution, the goal of preparing youth for employment in technical and semi-technical occupations, and of serving the occupational training needs of employed youth and adults.
3. The internal administration structure must facilitate the development of both the college parallel and occupationally oriented programs. Every institution should be organized to assure the efficient achievement of its goals. If one of the goals is to prepare youth for employment, the administrative structure should be designed so that this goal can be achieved. If the two-year college is to serve two major purposes, then it will need to have two major divisions, each headed by a Dean or Assistant Dean.
4. The technical division should be organized on the basis of related occupational areas to be served, such as Engineering Technologies, Industrial, Medical, Dental or

[a]Distribution according to potential enrollments needed for worker replacement demands in Illinois.

Health, Agricultural, Business, Graphic Arts, etc., each with majors in the specific technology.

5. Administrative and supervisory offices in the organization must be staffed with specialists who understand occupational education and who are responsible for development and operation of the occupationally oriented program. They should be given the responsibility and authority to develop and operate programs for which there is an identifiable need, as determined through occupational surveys and student interests.
6. The ultimate quality of a curriculum depends on the quality of its faculty. These attributes are desired of all college teachers: intelligence, a genuine interest in students, personal and professional integrity, a capacity for communicating ideas in oral and written form, a thorough knowledge of subjects taught and skill in the fundamentals of the teaching-learning process. These attributes may not be entirely represented by formal academic training. The faculty may not necessarily be required:
   (a) To meet current certificate requirements in the public school programs;
   (b) To meet formal degree requirements of regular collegiate academic programs.

   Since the technical and semi-technical curriculums educate students primarily for specialized areas, it follows that a significant proportion of the faculty must have had relevant industrial experience and that this experience must be reasonably current. In some fast-moving technological fields, experience over ten years old can be as much a handicap as an asset. Faculty members must be required (a) to maintain technical competence in their fields through participation in technical and professional societies and (b) to engage in work in industry or in research. They must be urged to keep up with the literature of their fields, to continue their education, to attend professional meetings, and to experience first-hand what is taking place in the industries related to their specialties. Time and financial assistance should be provided to encourage such growth. Promotions should be based on a balanced judgment of the instructor's capability to bring broad experience and academic background to bear on his teaching and not solely on the acquisition of higher academic degrees.
7. Provision must be made in the administrative structure for

continual curriculum development. Programs must be continually evaluated, revised when necessary, dropped when no longer needed, and new programs added as needs dictate.

8. Policies regarding student selection should be carefully developed. Admission into technical programs should be based upon high but realistic standards. These standards would not be the same for all programs.
9. Special counseling, advisement, and placement services must be made available to two-year technical students. Follow-up of all graduates is also necessary if the program is to meet changing occupational needs.
10. The extensive use of advisory committees in each of the major occupational areas is essential. These advisory committees must include both regional and state-wide representation, and must include representatives of the occupation for which training is offered and of professional organizations.

Summary

The interests and talents of a large fraction of young Illinois men and women and the needs of business, industry, and services in the state meet in the demand for a great statewide expansion in first-rate, college-level, one- and two-year programs in technical and semi-technical education. Professional-level education is necessarily becoming more theoretical and sophisticated as new basic knowledge is rapidly brought to bear in the applied fields. A serious gap is developing in education for the actual operation of the increasingly complex equipment and procedures that are characteristic of industry and the professions—construction, automated manufacturing, communications, the health professions, business data processing, to name only a few. Such education is desired by many high school graduates and by adults who need additional training or retraining in a new field.

McLure and his co-authors calculate conservatively that annually, in the mid-1960's, Illinois could use effectively, as additional workers and replacements, 20,366 graduates of two-year technical curriculums and 44,745 graduates of one-year semi-technical curriculums.

Our proposal, again following McLure, is a more modest one, namely, that as soon as possible Illinois should provide new col-

lege-level educational facilities and programs to enroll approximately the following numbers:

	Full-time Students	Part-time Students
Technical level (2-year)	13,900	13,200
Semi-technical level (1-year)	43,000	40,000

The graduates from such enrollments, together with graduates from private technical schools, might provide about half of the trained workers needed annually in Illinois, according to the above estimate. The part-time students should include large numbers of adults who are learning in order to keep up with developments in their lines of work, or who need to learn new fields.

Committee H believes that a statewide system of regional, comprehensive two-year colleges, each with a division to administer technical and semi-technical curriculums, should be established as soon as possible. The plan outlined by McLure and his co-authors, in which the state is divided into ten regions, may be taken as a model. The final decisions as to number and boundaries of regions, location of main and auxiliary centers, the number and choice of curriculums to be offered in each region, and other conditions and details will need to be developed by regional and state bodies established to administer the system. Plans for the system should make maximum use of established centers of technical and semi-technical education.

It is further believed that centralized state financial support and substantial centralized control are essential to high quality, efficiency, and flexibility in technical and semi-technical education in the state. High-quality technical education is relatively costly in faculty, buildings, and equipment. A curriculum should not be established unless it is quite clear that the enrollment will justify it. McLure and his co-authors have set the minimum efficient enrollment for a curriculum at approximately 50 full-time and 60 part-time students. On this basis, the number of regions in which it is recommended that a curriculum be established varies from one to ten, depending upon the estimated demand for graduates from the curriculum in the state as a whole (see Table 1, page 5). The semi-technical curriculums should have larger total enrollments and may be more widely distributed. Popular curriculums may be located at one or two auxiliary or extension centers in each region as well as at the regional centers (see Table V). A plan for a limited number of high-quality technical education centers implies that some students will attend a college not located in the region in which they live, particularly if they

wish to prepare to work in a field of limited demand. Flexibility in choice of curriculum will thus be aided by financing the statewide system primarily at the state level of government. These considerations of quality, efficiency, and flexibility point to the merits of accepting post-high-school education in the two-year colleges as a statewide enterprise, to be financed at the state level, except for federal support and tuition charges to students.

DOCUMENT NOT AVAILABLE FROM EDRS 22p.

*VOCATIONAL AGRICULTURE, QUESTIONNAIRES, *EDUCATIONAL PROGRAMS, *FARMER COOPERATIVES, *PROGRAM EVALUATION, RURAL YOUTH, YOUTH PROGRAMS,

FFA, Cooperative Acquaintanceship Program, Farm Bureau,

County Farm Bureau secretaries of organizations in Illinois were surveyed to -- (1) determine the nature and extent of Future Farmers of America (FFA) Cooperative Acquaintanceship Programs now being conducted, (2) discover their attitudes and opinions about the values of these programs, (3) discover ways and means of upgrading the programs, and (4) develop a model which could be used on a pilot basis in counties where new or revised programs are contemplated. All secretaries responded to the 32-item questionnaire which was sent to them. A summary of responses is given for each item, and findings are summarized and commented on. Findings included -- (1) 65 counties or 66.3 percent of the county units in Illinois hold FFA Cooperative Acquaintanceship Programs, and (2) The most frequently mentioned reasons for conducting FFA Cooperative Acquaintanceship Programs are to acquaint students with Farm Bureau-type cooperatives and to help students understand how these cooperatives work. The questionnaire form is included. This study was a part of a broader research project, "Education Regarding Cooperative Organizations in Rural Areas." (EM)

Foreword

This publication is a report of a survey of county Farm Bureau secretaries of organization in Illinois regarding how the FFA Cooperative Acquaintanceship Programs are conducted in their counties. This survey is a part of a broader research project entitled, Education Regarding Cooperative Organizations in Rural Areas. The objectives of this project are:

1. determine current educational programs in rural communities regarding cooperative organizations.
2. assess the relative effectiveness of various educational programs regarding cooperative organizations in rural communities.
3. determine opportunities for educating people in rural areas about their cooperatives.
4. develop plans for fostering understanding of the functions and operating procedures of rural cooperatives.

The study of FFA Cooperative Acquaintanceship Programs in Illinois contributes directly to these objectives and will be a valuable portion of the total data being obtained pertaining to education regarding cooperative organizations in rural areas. Dr. Paul Hemp, principal investigator, and Mr. Norman Ehresman have probed incisively into the operation of the FFA Cooperative Acquaintanceship Programs in the various counties. The information they have obtained and the insight they have provided regarding the effective operation of these programs will have much practical value to persons responsible for organizing and conducting future FFA Cooperative Acquaintanceship Programs. The study should also be of value to teachers and FFA members who plan to participate in FFA Cooperative Acquaintanceship Programs.

Lloyd J. Phipps
Project Director

ACKNOWLEDGMENTS

The data presented in this report were furnished by the county secretaries of organization in Illinois. The writers wish to commend them for responding 100 percent to the research questionnaire.

Special acknowledgments are due Mr. Kenneth Cheatham, Director of Youth Activities, Illinois Agricultural Association and the following members of the Youth Activities Committee:

Mr. Ken Cassens
Mr. Henry Chamberlain
Mr. Ralph Hofstad
Mr. Theron Summers
Mr. Al Kemnitz

Mr. Cheatham sent the questionnaires to the county secretaries of organization, and he and his committee members provided valuable counsel and encouragement throughout the period when the study was being conducted.

Paul E. Hemp
Norman D. Ehresman

PART I
DESCRIPTION OF THE STUDY

Situation. FFA Cooperative Acquaintanceship Programs are held in most of the counties in Illinois. Typically, these programs are planned jointly by the county secretaries of organization[1] and school staffs. Vocational agriculture students at the junior and senior levels are usually invited to participate.

The nature of FFA Cooperative Acquaintanceship Programs varies greatly from county to county. Some county secretaries of organization have expressed a desire to improve these programs, and other secretaries would like to start new programs in their counties.

Purposes of the CSO Survey. The major purposes of surveying the county secretaries of organization were as follows:

1. to determine the nature and extent of FFA Cooperative Acquaintanceship Programs now being conducted in Illinois.
2. to discover the attitudes and opinions of county secretaries of organization regarding the value of these programs.
3. to discover ways and means of upgrading FFA Cooperative Acquaintanceship Programs.
4. to develop a prototype or model which may be used on a pilot basis in counties where new or revised programs are contemplated.

Procedures Used. Copies of Survey Form II, Education Regarding Cooperative Organizations in Rural Areas, were sent to Illinois county secretaries of organization by Mr. Kenneth Cheatham, Director of Youth Activities, Illinois Agricultural Association. The full cooperation of the county secretaries resulted in a 100 percent response. A copy of Survey Form II appears at the end of this report.

The tabulations and the analyses of the data collected were made by the Agricultural Education Division staff. A summary of responses appears in Part II of this report. Part II includes a list of the major findings and reactions which have been drawn from the data. A proposed prototype or model outlining a suggested procedure for planning and conducting FFA Cooperative Acquaintanceship Programs will be developed as a separate publication.

---

1. County secretaries of organization (CSO's) are employees of county Farm Bureaus.

PART II

SUMMARY OF RESPONSES

The data summarized and presented in this report appear in the form of answers to specific questions, lists of activities and practices followed in the counties of the state, and information presented in tabular form.

QUESTION: Do you have an FFA Cooperative Acquaintanceship Program in your county?

RESPONSE: Sixty-five counties or 66.3 percent of the county units in Illinois hold FFA Cooperative Acquaintanceship Programs.[2]

QUESTION: What are the major reasons for not holding an FFA Cooperative Acquaintanceship Program?

RESPONSE: The major reasons given by secretaries of organization for not holding FFA Cooperative Acquaintanceship Programs are summarized in Table I.

TABLE I

FREQUENCY AND PERCENTAGE OF CSO'S WHO LISTED VARIOUS REASONS FOR NOT HOLDING FFA COOPERATIVE ACQUAINTANCESHIP PROGRAMS

(N=33)

Reason	Frequency	Percentage
1. Lack of interest and cooperation	15.	45.5
2. No reason given--planning now to start program	13.	39.4
3. No reason given	9.	27.3
4. Lack of funds	3.	4.6
5. No FFA chapters in county	1.	3.0
6. High turnover of CSO's	1.	3.0

2 Illinois is divided into 102 counties; however, in four instances two counties cooperate by employing one county secretary of organization.

QUESTION: What are the values of conducting an FFA Cooperative Acquaintanceship Program?

RESPONSE: County secretaries of organization gave several reasons for conducting Acquaintanceship Programs. These reasons have been summarized and listed in Table II.

TABLE II

FREQUENCY AND PERCENTAGE OF CSO'S LISTING VARIOUS REASONS FOR CONDUCTING FFA COOPERATIVE ACQUAINTANCESHIP PROGRAMS

(N=65)

Reason	Frequency	Percentage
1. Acquaint students with cooperatives	41.	63.1
2. Help students understand how a cooperative operates	12.	18.5
3. Help students understand the Farm Bureau and the IAA	9.	13.8
4. Acquaint students with job opportunities in cooperatives	4.	6.2
5. Gain new business	1.	1.5

QUESTION: When do you hold your Acquaintanceship Program?

RESPONSE: Time of year. Of the 65 counties conducting Acquaintanceship Programs in 1963-64, 75.3 percent of the counties (49) held these programs in late winter or early spring. Twelve counties held their meetings in the fall or early winter. One county held its meeting in June after the schools had closed.

Day or time. Thirty-five percent of the counties (18) indicating a day or time for Acquaintanceship Programs held these meetings during school hours. Thirty-three counties conducted Acquaintanceship Programs on Saturdays or holidays, or after-school hours on school days.

QUESTION: What is the length of Acquaintanceship Programs?

RESPONSE: Sixty-one of the 65 counties conducting Acquaintanceship Programs responded to this question. The length of meetings reported and the number and percentage of counties reporting each length are shown in Table III.

TABLE III

FREQUENCY AND PERCENTAGE OF COUNTIES CONDUCTING FFA COOPERATIVE ACQUAINTANCESHIP PROGRAMS OF VARIOUS LENGTHS

(N=61)

Length of Program	Frequency	Percentage
1. One day	18.	29.5
2. One-half day	18.	29.5
3. One day plus evening	14.	23.0
4. One evening	6.	9.8
5. Two class periods in each school	4.	6.6
6. Two days	1.	1.6
Total	61.	100.0

QUESTION: Which FFA members are invited to attend the program?

RESPONSE: Fifty-nine of the 65 counties reporting on their programs answered this question. The responses of these 59 CSO's are summarized in Table IV.

TABLE IV

FREQUENCY AND PERCENTAGE OF COUNTIES INVITING FFA MEMBERS OF VARIOUS GRADE LEVELS TO ATTEND ACQUAINTANCESHIP PROGRAMS

(N=59)

Class or other basis	Frequency	Percentage
1. Grades 11 and 12	31.	52.5
2. Grade 12 only	13.	22.0
3. Grades 9, 10, 11, and 12	6.	10.2
4. Grade 11 only	4.	6.8
5. Selections made by teachers	4.	6.8
6. Program taken to schools	1.	1.7

QUESTION: Who, other than FFA members, is invited to Acquaintanceship Programs?

RESPONSE: Replies to this question from 65 counties are summarized in Table V.

TABLE V

PERCENTAGE OF COUNTIES INVITING VARIOUS GROUPS OF PERSONS TO THEIR ACQUAINTANCESHIP PROGRAMS

(N=65)

Group	Percentage of Counties Inviting Group
Agriculture teachers	64.6
Board members of county cooperatives	32.3
School administrators and counselors	32.3
Affiliate company managers	30.8
Staff members of affiliate companies	15.4
Fathers of students	4.6
Others	9.2
FFA members only	13.8
No reply	4.6

QUESTION: What is the approximate cost of Acquaintanceship Programs and how are these programs financed?

RESPONSE: The data in Table VI show the amounts spent by counties on Acquaintanceship Programs. The data in Table IV reveal that more than 65 percent of the counties spend less than $201. on these programs.

TABLE VI

FREQUENCY DISTRIBUTION OF COUNTIES CLASSIFIED ACCORDING TO THE AMOUNT OF MONEY SPENT ON FFA COOPERATIVE ACQUAINTANCESHIP PROGRAMS

(N=65)

Cost in dollars	Frequency	Percentage
0-25	4.	6.2
26-50	10.	15.4
51-100	16.	24.6
101-150	7.	10.8
151-200	8.	12.3
201-250	2.	3.1
251-300	5.	7.7
301-350	2.	3.1
351-up	3.	4.6
$2.50/person	3.	4.6
No reply	5.	7.7

The usual sources of funds used for the financing of Acquaintanceship Programs are Farm Bureaus, Service Companies, and Affiliated Companies. The data in Table VII show a complete breakdown of counties grouped according to the sources from which funds are obtained.

TABLE VII

SOURCES OF FUNDS USED TO FINANCE ACQUAINTANCESHIP PROGRAMS AND THE NUMBER AND PERCENTAGE OF COUNTIES USING EACH SOURCE

(N=62)

Source	Frequency	Percentage
Farm Bureau	39.	60.0
Service company	31.	47.7
Farm Bureau and affiliate companies share expenses	13.	20.0
Insurance company	6.	9.2
Producers livestock company	4.	6.2
Grain company	2.	3.1
Production credit association	1.	1.5
Producers seed company	1.	1.5
FFA pays half of the expenses	1.	1.5

Planning the program. County secretaries of organization were asked to respond to a series of questions concerning the planning of FFA Cooperative Acquaintanceship Programs. Listed below are the percentages of counties which followed certain planning practices.

1. Vocational agriculture teachers help in the planning of the program. (97%)
2. Managers of cooperatives participate in the planning of the program. (97%)
3. A meeting is held to plan the program. (85%)
4. High school administrators are contacted prior to the planning period. (52%)
5. Board members of county cooperatives help in the planning of the program. (40%)

Conducting acquaintanceship programs. County secretaries of organization were asked to indicate the activities and procedures used in conducting Acquaintanceship Programs in their counties. The percentages of counties using certain specified activities are as follows:

1. Managers of county co-ops take part in programs. (98.5%)
2. The functions of Farm Bureau are discussed during the program. (98.5%)
3. The organization, operation, and control of a cooperative is taught. (95.4%)
4. The organization of the IAA is taught to students. (93.8%)
5. Tours of co-op facilities are included in the program. (84.6%)
6. A banquet is held as a part of the program. (81.5%)
7. Special speakers are invited to participate in the program. (60%)
8. Teachers are influenced to teach a unit on cooperatives prior to "Acquaintanceship Day." (39%)
9. Board members of county co-ops participate in programs. (38.5%)
10. Small group discussions are scheduled as a part of the program. (33.8%)
11. Follow-up meetings with FFA chapters are held. (33%)
12. CSO's visit vocational agriculture classes or FFA meetings. (30.8%)
13. Entertainment is included as a part of the program. (10.8%)

In addition to the activities and procedures listed, other program activities identified by county secretaries of organization included the following:

1. Ask FFA members to report what they have learned.
2. Try to entertain boys and develop friendships.
3. Discuss career opportunities with representatives from the Farm Bureau and its affiliates.

4. Ask an FFA member from each school to talk five minutes on the cooperative activities at his school.
5. Use educational slides such as Legislature and the Farm Bureau in Action.
6. Take students on trips to plays, basketball games, feed mills, baseball games, and so forth.

QUESTION: Describe other activities or aspects of your program not covered elsewhere in this survey.

RESPONSE: County secretaries of organization listed the following additional suggestions for planning and conducting FFA Cooperative Acquaintanceship Programs:

1. We always need more time but we are fortunate to get one-half day.
2. We have the chapter presidents express their opinions at the close of the banquet.
3. We always have a "question-and-answer" session.
4. We change our program a little each year.
5. We invite persons from Production Credit Associations and Land Bank Associations to show the boys a well-rounded cooperative program.
6. We spend some money for "give-aways" (nail clippers).
7. We allow students to observe a regular Farm Bureau board meeting and to have lunch with the Board.
8. We allow FFA members to spend a day with a cooperative employee.
9. We cooperate with a neighboring county in sponsoring a meeting.
10. We send one student to the American Institute of Cooperation meeting.
11. We have seniors visit Farm Supply facilities outside their home counties.
12. We visit schools and teach a class.
13. We divide our program into the following four phases:
    a. Dinner with agriculture teachers and administrators.
    b. Program for juniors.
    c. Out-of-county tour for seniors.
    d. Banquet for juniors, seniors, parents, school administrators, and agriculture teachers.

QUESTIONS: What are some of the problems you have encountered in planning and conducting the Acquaintanceship Program?

RESPONSE: The major problems listed in order of frequency by county secretaries of organization are as follows:

1. Scheduling meetings.
2. Providing interesting programs.
3. Getting attendance.
4. Securing cooperation of schools.
5. Overselling Farm Bureau.
6. Overcoming effects of bad weather.
7. Financing the program.

QUESTION: What changes do you intend to make in the program next year?

RESPONSE: Changes listed by county secretaries of organization and the number of persons listing each change are as follows:

Change	Number of CSO's Listing Change
1. None, very little, or undecided	36
2. Use more educational devices such as group discussions, demonstrations, and tests	7
3. Improve and expand program	4
4. Include a banquet	3
5. Plan program better and involve teachers in planning	3
6. Drop tour	2
7. Include a tour	2
8. Hold meeting earlier in year	2
9. Invite juniors as well as seniors	2
10. Start at 3:30 p.m. on school day	1
11. Use delegates to IAA sponsored FFA Holiday Conference on program	1
12. Show students career opportunities in IAA affiliates	1
13. Get more financial assistance	1
14. Do away with speaker	1
15. Schedule a program every other year	1

PART III

SUMMARY

The results of this survey show that many successful procedures have been used in planning and conducting FFA Cooperative Acquaintanceship Programs. It is not the intent of the writers to prejudge each of these practices or to suggest that every county should use the same practices. It is apparent, however, that certain practices and procedures seem to stand out in terms of frequency of use, while other practices and procedures are rarely used or seem to be of questionable value. The following findings and reactions should help the reader identify those practices and procedures which are most useful to him:

FINDING NO. 1: Reasons for conducting FFA Cooperative Acquaintanceship Programs mentioned most frequently by CSO's were to acquaint students with Farm Bureau type cooperatives and to help students understand how these cooperatives work.

REACTION: If one accepts the opinions of a majority of the county secretaries of organization, one should give major emphasis to educational activities which help students learn how cooperatives are organized and operated. Overselling of the Farm Bureau and agricultural policy-making do not appear to be compatible with the major educational objectives accepted by a majority of the CSO's. In keeping with the purposes outlined in Finding No. 1, the most appropriate name for these programs appears to be "FFA Cooperative Acquaintanceship Program," sponsored by the Illinois Agricultural Association, its affiliated companies and county Farm Bureau and affiliates.

FINDING NO. 2: This study shows that three-fourths of the counties held Acquaintanceship Programs in late winter or early spring, and 64 percent of the counties responding held these programs outside of school hours.

REACTION: Evidently, the practice of holding FFA Cooperative Acquaintanceship Programs during the winter season has proven successful in many counties. The scheduling of Acquaintanceship Programs should also be based on a consideration of when most teachers teach a classroom unit on cooperatives.

FINDING NO. 3: Eighty-two percent of the 61 CSO's who responded to a question regarding the length of their Acquaintanceship Programs indicated that these programs lasted either one day, one-half day, or one day plus an evening.

REACTION: The amount of time available during Acquaintanceship Programs is very limited. Certain worthwhile activities may have to be deferred until a later date. Perhaps tours of facilities should be handled as a separate activity rather than incorporated into a half-day Acquaintanceship Program.

FINDING NO. 4: About 80 percent of the counties reporting on their programs invited only students from grades 11 and 12.

REACTION: Apparently, the persons who planned and conducted FFA Cooperative Acquaintanceship Programs felt that the more mature junior and senior students are able to benefit more from these programs than underclassmen. Furthermore, classroom instruction on cooperatives is usually provided in the advanced agriculture classes. The Acquaintanceship Program can serve as a follow-up to formal instruction at school.

FINDING NO. 5: Less than two-thirds of the CSO's reported that they invited the agriculture teachers, and less than one-third of the CSO's reported that they invited board members of county cooperatives, school administrators, counselors, and affiliate company managers to their Acquaintanceship Programs.

REACTION: When finances permit, persons other than FFA members should be invited. Attendance of persons other than FFA members can be encouraged by inviting such persons to participate in the program or to assist with the arrangements.

FINDING NO. 6: About two-thirds of the counties spent less than $201 on their FFA Cooperative Acquaintanceship Programs.

REACTION: It is not necessary to spend huge amounts of money in order to conduct an Acquaintanceship Program. The decision regarding cost-sharing by various groups should be made in each county. The degree to which participating groups share in the financing of these programs should probably not be predetermined by outside groups but left to the individual counties.

FINDING NO. 7: Vocational agriculture teachers and managers of cooperatives usually participated in the planning of Acquaintanceship Programs. Organized planning meetings are held in 85 percent of the counties responding to this section of the survey form.

REACTION: Thorough planning is apparently a prerequisite to a successful program. The involvement of agriculture teachers and cooperative employees in program planning is highly desirable.

FINDING NO. 8: Tours of cooperative facilities were commonly included in Acquaintanceship Programs.

REACTION: Tours of facilities are valuable educational activities, but they should not serve as substitutes for group discussions and other instructional activities which help acquaint students with the "human" side of cooperative businesses.

FINDING NO. 9: Fewer than one-third of the CSO's reporting indicated that they made visits to vocational agriculture classes or to FFA meetings.

REACTION: This study did not attempt to discover why CSO's or cooperative personnel were not used more often as resource persons in the high schools. Perhaps teachers of vocational agriculture would utilize resource persons to better advantage if a listing of such persons were made available.

FINDING NO. 10: A few counties reported that FFA members were asked to evaluate the Acquaintanceship Program orally as a part of the evening session.

REACTION: Students are more likely to say what they think when written rather than oral evaluations are used. Students should not be required to sign evaluation sheets.

FINDING NO. 11: In some counties, Production Credit Associations or cooperatives not associated with the Illinois Agricultural Association were invited to participate in Acquaintanceship Programs.

REACTION: One advantage of including cooperatives not affiliated with the Illinois Agricultural Association in an Acquaintanceship Program is that students are exposed to a broader picture of the total cooperative movement. Use of Farm Bureau type cooperatives other than affiliated companies outlines those areas of service to farmers not presently rendered by IAA companies.

FINDING NO. 12: The number of educational activities which CSO's promoted or made available to high school students was too extensive to accomplish during a one-day Acquaintanceship Program.

REACTION: An Acquaintanceship Program may be considered as only one phase of an annual program of education regarding cooperatives. One county has developed an educational program consisting of the following activities:

1. Planning meeting to involve agriculture teachers and school administrators.
2. Acquaintanceship Program for juniors.
3. Tour for seniors of out-of-county facilities of Illinois Agricultural Association.
4. Banquet and program for juniors, seniors, and others.

FINDING NO. 13: County secretaries of organization indicated in this survey that scheduling meetings, providing interesting programs, securing attendance, and securing school cooperation were some of the major problems involved in conducting Acquaintanceship Programs.

REACTION: Finding a date and time agreeable to all individuals and groups is a problem which was mentioned most frequently by CSO's. In some counties, teachers and school administrators do not allow students to attend Acquaintanceship Programs during school time.[3] A few school administrators have regarded the Program as a "selling" activity rather than an educational activity. Practices followed by several CSO's to solve the problems of dates, attendance, and programming are as follows:

1. Meet with agriculture teachers and school administrators well in advance of Acquaintanceship Program to plan the program and set dates.
2. Call on school administrators and explain the purposes of the program. Stress the educational nature of the program.
3. Provide a fast-moving, interesting program which includes active participation by students. Avoid long speeches and dry lectures.
4. Develop a program which provides instruction about cooperatives. Keep the "selling" aspect to a minimum.

FINDING NO. 14: County secretaries of organization who planned to make changes in their Acquaintanceship Programs indicated that they planned to use more educational devices such as group discussions, demonstrations and tests.

REACTION: County secretaries of organization who wish to improve their Acquaintanceship Programs could benefit from an outline of a model program or a list of suggested teaching procedures and practices. A publication of this nature will be developed and made available.

---

3 Permission granted by the Illinois High School Association for the Farm Bureau and its affiliates to conduct this program does not include school hour participation outside the classroom or off campus. Local administrators may and do make exceptions.

EDUCATION REGARDING COOPERATIVE ORGANIZATIONS IN RURAL AREAS

SURVEY FORM II

Answer in terms of your most recent program.

	Yes	No	
1.	____	____	Do you have an FFA-Farm Bureau Acquaintance Day Program in your County? If you answer NO, go to item 32.
2.	____	____	Do board members of the county co-ops help in planning the meeting?
3.	____	____	Do vocational agriculture teachers assist with the planning?
4.	____	____	Do you contact the high school principals prior to planning?
5.	____	____	Do the managers of the member co-ops participate in the planning?
6.	____	____	Do you hold an organized planning meeting?
7.	____	____	Do you try to influence vocational agriculture teachers to teach a unit on cooperatives just prior to your acquaintance day program?
8.	____	____	Do you consider your program to be of an educational nature?
9.	____	____	Do board members of county co-ops take part in the program?
10.	____	____	Do managers of county co-ops take part in the program?
11.	____	____	Do you or board members or others have follow-up meetings with the FFA Chapters?

Check the following activities that are included as part of your program.

12.	____	____	Tours of co-op facilities
13.	____	____	Banquet
14.	____	____	Small group discussions
15.	____	____	Special speaker
16.	____	____	Teaching the organization of IAA
17.	____	____	Teaching the organization, operation, and control of a cooperative
18.	____	____	Teaching the functions of Farm Bureau
19.	____	____	Visits to vocational agriculture classes or FFA meetings
20.	____	____	Entertainment
21.	____	____	Others (list)

Give brief answers to the following questions

22. When do you hold your Acquaintanceship meeting? (Time of year, time of day, Saturday, etc.)

23. What is the length of this meeting?

24. Which FFA members do you invite?

25. Whom do you invite other than FFA members?

26. What is the approximate cost of your program and how is it financed?

27. What changes do you intend to make in the program for next year?

28. If there are activities or aspects of your program not covered above, please describe.

29. What are the values, if any, of conducting an FFA-Farm Bureau Acquaintance Day?

30. In planning and conducting the program, what are some of the problems you have encountered?

31. If you printed a program for your Acquaintance Day would you include a copy when you return this form?

32. If an FFA-Farm Bureau Acquaintanceship program is not conducted in your county, list the major reasons why?

South Dakota,

The 1964 session of the South Dakota Legislature passed House Concurrent Resolution no. 1, directing the State Legislative Research Council to conduct a study of existing vocational education opportunities in the state. Data from the U.S. Dept. of Labor, U.S. Office of Education, U.S. Bureau of the Census, individual schools, the South Dakota State Board of Education, and other sources were analyzed to meet this requirement. From the analysis, guidelines for improving vocational education were proposed -- (1) A comprehensive state-wide occupational survey should be conducted, (2) A detailed inventory of the state's educational facilities should be made, (3) Consultation with the state's leaders in industry, business, agriculture and labor should precede new programs, (4) If existing programs are adequate in certain areas, new programs in these areas should not be started, (5) Continual contact with industrial, busines, agricultural, and labor leaders should be maintained during program development, (6) Followup studies of present graduates and studies comparing costs with other forms of education should be made, and (7) The legislature should consider the feasibility of increased cooperation between state supported and private vocational education. Data covering enrollment, finances, expenditures, and curricula are included. Expansion of present programs, cooperation with neighboring states, and the passage of the Youth Employment Act are among the alternatives offered. (EM)

INTRODUCTION

The 1964 session of the South Dakota Legislature passed House Concurrent Resolution No. 1 (Appendix I to this paper), directing the State Legislative Research Council to conduct a study of existing vocational education opportunities in the state. The Executive Board of the Legislative Research Council subsequently accepted this subject as a topic for interim study. The purpose of this memorandum will be to present information regarding existing vocational opportunities in South Dakota at all educational levels, and in all educational institutions, public and private.

Vocational education in the state of South Dakota is still in the infancy stages. The great bulk of all vocational training in the state is being conducted in the high schools. There are, of course, exceptions to this statement, and notable among them is the vocational education program at Southern State Teachers College in Springfield. However, Southern is essentially a teacher training institution and not a vocational school.

There seems little doubt that there is a need for skilled technicians in almost all fields of employment in South Dakota. South Dakota is not alone in this respect. In fact, the state is much more fortunate than many of the highly industrialized states in the northeastern section of the country. Nonetheless, South Dakota has problems which can be summarized as follows: first, increased automation of farms has resulted in an exodus of farm-reared and largely unskilled youths to urban areas, resulting in increased unemployment; and, second, although South Dakota is not regarded as an industrial state, there are needs of existing and potential industry which are not being met by the vocational programs in the various local schools.

The entire problem surrounding vocational education was summed up very well in the introduction to "Education and Training for the World of Work," a study issued July, 1963, by the Upjohn Institute for Employment Research:

> The need for a greater emphasis on the preparation of both youth and adults for today's world of work is everywhere becoming recognized. As important as general education is for the development of the individual and the preservation of our culture and way of life, it is not enough for the great majority of people who must operate our machines, shops, and offices and provide our services. More and more occupations require skills and specialized knowledge for which there must be prior training.
>
> The relative increase in the demand for people with skills and the relative decrease in demand for those without skills or with obsolete skills are logical results of the technological advance that

has been going on for a long time. The present increase in the pace of technological advance, including automation, and the accompanying population explosion have only magnified them. As a consequence, hundreds of thousands of people remain unemployed. They consist of high school graduates as well as school dropouts, adults who have been squeezed down and off the employment ladder, women wishing to enter or reenter employment, the culturally disadvantaged, and other groups that might be identified.

The causes of unemployment are as complex as the industrial order itself. The lack or the immobility of any essential resource, including skilled labor, and particularly the lack of entrepreneurial ingenuity and enterprise, may check the growth of the economy before it can possibly provide enough jobs suitable for the many unskilled now out of work. But insofar as the individual is concerned, one common cause for unemployment is lack of a salable skill. The choice for many, therefore, may be either to acquire a salable skill or to settle down on public aid as a way of life.

Because of the present acuteness of unemployment, society has become preoccupied with providing short intensive training programs for one or another of the groups of unemployed, and rightly so. But over and over again such attempts at training have been blocked by the lack of training essentials: there may be no facilities, equipment, or materials; no curriculum; no instructional aids; or indeed no teachers. These are products of educational systems and institutions and of years of experience and development, the lack of which cannot be overcome easily or quickly.

The development of an adequate vocational education system, therefore, is prerequisite to a successful program of training and retraining. How to provide such a system as an integral part of total education and avoid deadend tracks for those who take vocational training constitutes one of the major educational challenges of the present day.

Since South Dakota is an agriculturally oriented state, the problem of vocational education, quite naturally, is focused on farm youth. A large percentage of farm boys and girls do not complete high school or college and at the same time they find that due to increased mechanization they must leave the farms which are rapidly dwindling in number. Agricultural technology has, in fact, increased American farm production 35 per cent since 1940. Coincident with and

resulting from the increase has been a reduction in man hours needed on our farms, by about 48 per cent. Productivity per man hour has doubled in the last 20 years. Listed below is a chart indicating the net migration of persons from the nation's farms in the past 40 years.

Period (April-April)	Number of persons leaving farms
1920-1930	6,300,000
1930-1940	3,800,000
1940-1950	9,500,000
1950-1954	4,700,000
1954-1958	2,500,000

Source: U. S. Department of Agriculture, "Farm Population," AMS-80 (1958).

A 1958 report of the U. S. Department of Agriculture Federal Extension Service entitled, "Opportunities and Limitations for Employment of Farm People Within and Outside of Farming," estimated that if present trends continue, no more than 15 per cent of the young men reared on farms reaching the age of 20 between 1954 and 1963 could hope to find farming opportunities that would result in net earnings of more than $2,500.00 per year. It is also estimated that only one farm boy in ten can expect full time employment on a farm in 1970. To illuminate this point the following chart prepared by the U. S. Department of Labor concerning the change in major occupational groups is presented:

Percentage Change in Major Occupational Groups in the United States, 1955-1965

Occupational groups	Percentage change
Professional and technical	+37
Proprietors and managers	+22
Clerical and sales	+27
Skilled craftsmen	+24
Operatives (semiskilled)	+22
Service workers	+13
Laborers	- 3
Farmers and farm workers	-15

Source: U. S. Department of Labor, "Our Manpower Future."

It would seem that there is a distinct need for a reevaluation of our vocational education needs and purposes. At the present time the number of farms and hence, the number of men needed to operate the farms, is diminishing rapidly. At the same time the principal emphasis in the vocational programs of the state's high schools is on agricultural education. The need today in South Dakota and throughout

the nation is for skilled craftsmen, mechanics, nurses, commercial personnel and other technicians.

Vocational training in industrial and trade courses is almost non-existent in the small, rural high schools of the state. These courses are almost exclusively found in the state's larger high schools. Agriculture is South Dakota's most important industry and there is most definitely a need for agricultural education in the state's high schools; however, it would seem that the state should adapt its vocational programs in accord with existing and future needs.

In terms of reevaluating vocational goals, there is a second point which deserves passing attention. The emphasis today is on mass education and while this is desirable, some educational philosophers contend that every young person should receive a higher education. This philosophy is unrealistic because many young people do not have the ability or the desire to pursue an academic course of study. On the other hand, many of the same young people do have a desire to learn technical skills and "work with their hands." Therefore, South Dakota's educational system should be well balanced, by appealing to young people with technical or vocational goals as well as those with academic or professional goals.

There are three major results of an inadequate vocational education program. The first is unemployment. Although South Dakota has no major unemployment problem at the present time, it could be a source of concern in the future. The chain of events leading from a lack of vocational facilities to unemployment is explained as follows: students uninterested in a strict academic course of study, but who may be inclined toward work in a certain trade often discover that the school they are attending has little or no training in that particular field. This situation is one of the main factors leading to the high school drop-out problem. A result in turn, with a large number of unskilled persons in the state, is unemployment.

A second result of inadequate vocational education in a state is that many young people, unable to find suitable training in their desired field, migrate to other areas of the nation. This leads to a serious loss of technical manpower resources. In turn, the loss of manpower resources results in decreased economic productivity and decreased revenue through taxation. South Dakota is one of the states that is losing manpower resources in the most productive age group; this fact is graphically presented in the following tabulation:

Characteristic	1960	1950	Per cent of Change
Population total	680,514	652,740	Plus 4.3
Under 18 years	262,163	221,181	Plus 18.5
18 to 65 years	346,838	376,263	Minus 7.8
65 years and Over	71,513	55,596	Plus 29.3

Source: U. S. Bureau of the Census, Final Census Reports, 1961.

A final result of inadequate vocational education is that which results when a person is forced to learn a trade on the job, excepting, of course, apprenticeship programs in which apprentices receive instruction on and off the job. However, when a person is forced to learn a trade on the job, without the benefit of apprenticeship training, the result is an economic loss to the worker himself, to his employer and to the entire economy of the state and nation.

Generalizations should always be avoided, but the simple fact of the matter is that inadequate vocational education can be extremely costly. It is an established fact that most of those who are unemployed are also unskilled. A later section of this paper will deal with the unemployment problem in greater detail. The following sections will also present existing vocational opportunities at all educational levels, a comparison of vocational opportunities in South Dakota with similar opportunities in other neighboring states and finally, certain proposed alternatives will be suggested.

It should be added at this point that a supplement to this memorandum will be issued concerning a specific vocational education need, that is, dental hygienist training.

THE ROLE OF THE FEDERAL GOVERNMENT IN VOCATIONAL EDUCATION

Federal Legislation

It became apparent, as early as the administration of President Woodrow Wilson, that there was a great need for vocational education in the United States. Legislators and administrators realized then, as they do now, that it made little sense to try to give every young person in the nation a college education. Because of interest and ability factors, not every person is designed for academic study in a college or university.

Due in large measure to the prodding of President Wilson, Congress recognized the importance of vocational education in 1917 when it passed the Smith-Hughes Act. This federal statute provided for an annual grant of $7.2 million to the several states for the purposes of vocational education. A matching program, it was distributed as follows: $3 million

for agricultural education; $3 million for trade and industrial and home economics training; $1 million for teacher training; and the balance for administration at the federal level.

There were a number of federal appropriations for vocational education passed subsequent to the Smith-Hughes Act and prior to the George-Barden Act of 1946. The George-Reed Act, adopted in 1929, provided for more funds for education in the fields of agriculture and home economics. When this Act expired, the George-Ellzey Act of 1934 was passed. This merely extended the provisions of the George-Reed Act until 1936. Finally, the George-Deen Act was adopted in 1937, providing for additional funds for vocational education, extending federal funds to distributive education and establishing funds for Alaska and the District of Columbia. Funds for vocational education in Hawaii and Puerto Rico had earlier been provided for in 1924 and 1931, respectively.

By the end of World War II it was clear to a majority of Congressmen that broader programs were needed in the field of vocational education in order to serve new groups of people, including demobilized defense and armed services personnel. The result was the George-Barden Act which replaced the George-Deen Act and provided additional funds for the same educational endeavors. This Act, passed in 1946, appropriated $29 million annually for agricultural, trade and industrial, home economics, teacher training and distributive education. The George-Barden Act was extended in 1956 to include federal aid to practical nurses training and training in the fishery trades and industries. Appropriations for these activities were set at $5 million and $375,000.00, respectively.

The National Defense Education Act, adopted by Congress in 1958, authorized an additional appropriation of $15 million for the next four years. This appropriation was intended for the training of highly skilled technicians in occupations necessary for the national defense. The program was subsequently extended to 1964 and in December, 1963, was extended even further as a result of the passage of the Perkins Act, Public Law 88-210.

One of the most recent federal acts designed to alleviate the shortage of skilled workers in the nation was the Area Redevelopment Act (ARA) of 1961. Essentially the purpose of this Act is to help solve the unemployment and underemployment problem in chronic labor surplus areas. This Act set forth a training program for unemployed workers and those who receive training are given a subsistence compensation. Congress authorized an annual appropriation of $4.5 million for the training program itself and $10 million for the subsistence benefits. The Act is administered by the Department of Commerce and the Department of Health, Education, and Welfare was assigned the responsibility of training the unemployed men. This Act is purely a federal program and

does not require matching funds from the participating states. In 1962, 9,000 men were trained by this program in 154 different training areas.

In 1962 the Manpower Development and Training Act (MDTA) was passed in order to supplement the ARA. This Act had a broader purpose than the ARA, since its intentions were to retrain men across the country rather than to restrict training to those in depressed areas. This Act provided for a three year appropriation of $435 million. The first two years the program would exist solely on federal funds, however, the third year the states were required to match the federal government with their own funds.

In 1961 the federal government contributed a total of about $48 million for the various vocational education programs. At the same time the states and local governments contributed totals of about $89 and $117 million, respectively. Federal contributions for this purpose have risen 150 per cent since 1940 and state and local expenditures have increased six times over since the same year.

Federal Vocational Education Programs

The following tabulation indicates the extent and purpose of federal expenditures for vocational education during fiscal year 1963:

Recipients	Estimated Distribution of Federal Appropriations (in millions)	
Total	$ 79.7	
High school age youth	24.0	(Smith-Hughes and George-Barden Acts)
Post-high school youth and adults	10.0	(technician training)
	4.5	(practical nurse training)
Youth and adults at work or unemployed	5.0	(technician training)
	7.5	(Smith Hughes and George-Barden Acts)
	3.0	(Area Redevelopment Act)
	20.0	(Manpower Development and Training Act)
	0.5	(practical nurse training)
	0.2	(fishery training)
Services to vocational and technical education	5.0	(administration, supervision, teacher training, and guidance services under Smith-Hughes and George-Barden Acts)

Source: Office of Education, U. S. Department of Health, Education and Welfare.

In fiscal year 1963 the federal government increased its expenditures for vocational education to $79.7 million. The Perkins Act, adopted in December 1963, would raise federal contributions for this educational field to $237 million by 1967. This Act will be discussed in greater detail in a later section of this paper.

In consideration of the number of persons employed in the various vocational fields, it seems apparent that enrollment in federally supported vocational education programs indicates an imbalance toward agricultural and home economics courses. The total enrollment in all federal programs in 1961 was 3,856,000. Of this total 806,000 were enrolled in agricultural courses; 963,000 in trade and industrial courses; 1,610,000 in home economics; 306,000 in distributive; 47,000 in practical nursing; and 123,000 in technical courses. These enrollment figures include both high school students and adults. It has been estimated that less than two-thirds of the nation's secondary schools offer federally reimbursable vocational education programs. Agricultural training is offered in almost half the nation's high schools, while only one tenth of the schools offered courses in trade and industrial training. One out of every 15 and 25 high schools offered subjects in distributive and technical fields, respectively. For a detailed analysis of enrollment in and expenditures for the various federally subsidized vocational education programs, see Appendix II. Appendix III is a compilation of federal, state and local expenditures for vocational education, by year. Appendix IV presents federal allotments for vocational education and the amounts unexpended, by year.

Purpose and Extent of Federally-Aided Programs

(The source of all statistics in this section is the Annual Reports of State Boards for Vocational Education, U. S. Department of Health, Education and Welfare, Office of Education, 1962.)

The purpose of agricultural education is to prepare young people for the occupation of farming and to increase the knowledge of those adults already engaged in agricultural life. In recent years the following subjects have been emphasized in vocational agricultural classes: farm management, including instruction in the keeping of accurate records; analysis of such records; proper use of credit; and efficient use of labor, machinery and equipment. In addition, several states have offered courses of instruction which relate to both agricultural and distributive education, such as food processing, food distribution, chemical pest control service, farm machinery sales and irrigation. Enrollments in vocational agriculture courses increased in 1962 by 2.2 per cent over 1961 and totaled 822,664, of which 269,569 were in the evening, 78,977 in part-time and 474,118 in day classes. Federal expenditures in 1962 were $13,644,907.00. The states

contributed $28,589,744.00 and the local governments or school districts, $31,057,246.00.

Distributive education includes training in merchandising, marketing, and management. High school and post-high school programs combine instruction with actual job experience and are carried out in cooperation with the business community. The purpose of this form of vocational education is to provide a basis for further study or occupational advancement. Extension programs account for roughly 85 per cent of the enrollment in distributive education. Special high-level seminar-type courses for small businessmen and managers in areas such as finance, taxation, personnel relations, labor-management relations, and foreign trade were initiated in 1962. These programs are administered through the cooperation of the Department of Commerce and the Small Business Administration. Enrollment in distributive education in 1962 totaled 321,065, of which 276,948 were through extension, 1,871 in post-high school part-time cooperative programs and 42,246 in high school part-time cooperative classes. This represented an increase in enrollment of 4.9 per cent over 1961. Federal expenditures in 1962 totaled $2,564,754.00. The states expended $4,302,611.00 and the local governments, $4,538,472.00.

There are three purposes of home economics education. The first is to prepare young people to learn homemaking skills; the second is to supplement the homemaking knowledge of adults; and the third purpose is to train both young people and adults in order that they may earn money in home related occupations. In high schools throughout the nation more than half a million young people are receiving home economics education. Training related to home economics, which is also supported by federal funds, includes teacher education, curriculum development, research and demonstration projects. A recent development in home economics education is the extension of this training to adults living in public housing centers. Earlier this training was conducted solely by the cities and states. Enrollment in home economics education increased by 7.2 per cent in 1962 and totaled 1,725,660, of which 610,787 were in the evening, 52,209 in part-time and 1,062,664 in day classes. Expenditures by the federal, state and local governments were $8,874,426.00, $32,522,053.00 and $38,501,830.00, respectively.

Programs in practical nursing and other health occupations are designed for high school students, post-high school people and adults wishing to take refresher courses. Practical nursing programs generally last for one year. Other programs in health occupations last from two weeks to two years, depending on the nature of the training. In most cases practical nursing is conducted with the cooperation of community hospitals. In 1962 there were 548 such programs being operated by boards of education in the 50 states, Puerto Rico,

Virgin Islands and Washington, D. C. Most of those who take advantage of these programs are enrolled in programs under Title II of the George-Barden Act. Persons in this category totaled about 49,000, of which 35,000 were in preparatory classes and 14,000 were in extension courses. There were an additional 9,000 enrolled in classes under Title I of the George-Barden Act. The overall increase in enrollment in practical nursing and health occupation training was 12 per cent over that of 1961. Federal expenditures for these programs under Title II of the George-Barden Act in 1962 totaled $3,834,245.00. In addition, the states contributed $2,544,996.00 and localities, $3,280,299.00. Finally, a limited amount of federal funds are available for practical nursing under Title I of the George-Barden Act.

Programs to train highly skilled technicians in occupations necessary for the national defense receive federal support through the National Defense Education Act of 1958. Title VIII of the National Defense Education Act amends the George-Barden Act by adding a new title, III. This form of education is offered in high schools, area vocational schools, junior colleges, technical institutions and four year colleges having non-baccalaureate technical programs. Training is geared for two purposes. The first is preparatory and designed to allow young people and adults to enter recognized technical occupations. The second, extension courses, enables those already employed to keep pace with rapidly increasing technical improvements. Some of the fields covered by technical education include: data processing and computer programming; electronics, instrumentation, aeronautical, chemical, civil, electrical and mechanical design and production technologies. In 1962, 71 new area vocational schools were begun by 26 different states. Enrollment in these programs has risen from about 49,000 in 1959 to a 1962 total of 149,000. The 1962 total includes nearly 96,000 in refresher and upgrading courses, 40,000 in 2-year post-secondary preparatory programs and over 13,000 in high school programs. Expenditures in 1962 were $11,042,875.00, $5,456,967.00 and $8,106,010.00 for federal, state and local governments, respectively.

Trade and industrial education is geared for persons over 14 years of age who are either in school or out of school. Training programs are in countless fields and are skilled and semi-skilled. Generally speaking, persons are trained for work relating to design, production, processing, assembly, maintenance, and repair of machinery, appliances, and craft products. Enrollment in these training programs increased in 1962 by 4.3 per cent over 1961 and totaled 1,005,383, of which 557,604 were in evening classes, 153,396 in part time and 294,383 in day classes. Federal expenditures for trade and industrial education in 1962 totaled $11,476,867.00. States expended $30,847,949.00 and local communities, $42,762,194.00.

Administration of Federal Vocational Education Acts

Briefly stated, federal provisions in the Smith-Hughes and George-Barden Acts require states which participate in the federal programs to submit a state plan to the Office of Education. This plan must describe the proposed operation of a vocational education program and it must also establish assurance of reasonable efficiency of the program, before federal monies can be received. The state plan must also describe the structure of the state board for vocational education (to be created by the state Legislature). Once the state board is created it has sole authority to administer vocational education by cooperating with the Office of Education. There are many other federal requirements which must be met by the states before federal funds can be received. Some of them are as follows: the state treasurer must receive federal funds and provide for their proper custody and disbursement; all vocational education must take place under public supervision and control; all education must be of less than college grade; there must be minimum qualifications for instructors, supervisors and administrators engaged in the various programs; the state plan must describe the kinds of schools and types of equipment to be used; and federal funds can only be used for programs described in the state plans.

In turn the Office of Education has a number of responsibilities with respect to vocational education programs in the several states and territories. They are as follows: cooperating with the state boards in the administration of the federal acts; examining plans submitted by state boards and approving them if they are in accord with the provisions and purposes of the federal acts; making studies, investigations and reports for the purpose of assisting the states in the establishment of vocational schools and classes; informing the Secretary of the Treasury of the amount each state is entitled to receive from the federal government for vocational activities; and determining whether the states are using money received from the federal government in accord with the provisions of the acts.

The division of vocational education in the U. S. Office of Education has a number of specific duties regarding state vocational activities, including: administering the national program of vocational education under the provisions of the federal acts; working on the national and inter-state levels with public and private agencies and groups in activities relating to vocational education; cooperating with the states in identifying the instructional needs of individuals and communities on the basis of occupational opportunities and needs; cooperating with the states in planning, organizing, supervising and administering vocational education programs; cooperating with the states in developing instructional materials and standards for facilities for vocational education;

cooperating with the states in selecting instructors, supervisors, administrators and other personnel engaged in vocational education; cooperating with the states in improving instructional and guidance procedures in vocational education; and cooperating with the states in evaluating these programs.

To be more specific the federal government has stated that the assistant commissioner for vocational education, who heads the division of vocational education, shall have the responsibility for administering the federal vocational education acts and cooperating with the several states. Finally, each form of vocational education is headed by a director and several specialists who actually work with the states in improving vocational education.

Vocational Education Act of 1963

The purposes of H. R. 4955--Public Law 88-210, commonly referred to as the Vocational Education Act of 1963 or the Perkins Act--are: to authorize federal grants to the states to assist them in maintaining, extending and improving existing vocational education programs; to develop new programs for vocational education; and to provide part-time employment for young people who need financial assistance in order to continue their vocational training on a full-time basis.

This Act authorized $60 million to be appropriated for the fiscal year ending June 30, 1964; $118.5 million for fiscal year 1965; $177.5 million for fiscal year 1966; and for fiscal year 1967 and each fiscal year thereafter, $225 million. These funds are to be alloted among the states on the basis of population and per capita income.

To date the Congress has not appropriated funds for operation of this Act. However, on the basis of the provisions of the law it is estimated that for 1964, roughly $240,000.00 will be made available to the state of South Dakota under the Perkins Act. Federal allocations to the states under this Act will increase until 1967 when it is estimated that South Dakota could receive as much as $900,000.00 per annum.

State boards for vocational education will be the sole agency for administering federal funds alloted to states. The new funds are not earmarked for specific occupational fields. They may be expended for vocational education programs that will prepare people for employment in any occupational field that does not require a baccalaureate degree. Vocational programs may be conducted in comprehensive and technical high schools, area vocational schools, junior and community colleges, or universities that offer terminal vocational programs.

The Act provides that vocational programs be available for persons in high schools, for those out of high school and

available for full-time study, for persons who are unemployed or underemployed, and for persons who have academic or socio-economic handicaps that prevent them from succeeding in the regular vocational education programs.

Federal funds may also be used for ancillary services to assure quality in all vocational education programs; for example, teacher training, supervision and administration, research and evaluation of programs. Ten per cent of each year's appropriation will be reserved for grants by the Commissioner of Education for research and demonstration projects in vocational education. In addition, the Act provides for an experimental four year program for residential vocational education schools and payments for student work programs. The Commissioner of Education will determine the amount of the appropriation to be used for each of these purposes.

The Act requires that state and local expenditures continue at the current level of support for vocational education but does not require a state to match the new federal funds for program operation in fiscal 1964, except where federal funds are used for construction of vocational education facilities. For subsequent fiscal years, matching on a 50-50 basis is required. In addition, states must assure that federal funds complement but do not replace local and state funds.

To assure more flexibility in vocational education programs, the Perkins Act amends the Smith-Hughes and George-Barden Acts to permit the federal funds to be expended in agricultural training programs for occupations related to agriculture and for which knowledge and skill of agricultural subjects are involved. In addition to preparation for homemaking, home economics funds will also be directed toward homemaking skills for which there are employment opportunities. Not less than ten per cent of home economics funds under provisions of the Smith-Hughes and George-Barden Acts must be used for job-oriented training. Preparatory training is made possible under funds authorized for distributive education and occupational training for single skilled or semi-skilled jobs is permitted on a part-time basis for less than the traditional 9 months per year and less than 30 hours per week.

The area technical education program, authorized under the National Defense Education Act of 1958, is made permanent by the Perkins Act with an annual authorization of $15 million. In addition to extending this authority, the states will be allowed to expend new funds on a 50-50 basis for the construction of area vocational school facilities.

Finally, the Perkins Act makes permanent the practical nurse training programs authorized by Title II of the George-Barden Act. The annual appropriation is $5 million. Section 4 of the Perkins Act, which sets forth the uses of federal funds under the Act, may be found as Appendix V.

VOCATIONAL EDUCATION IN SOUTH DAKOTA'S COLLEGES

Although the vocational education department at Southern State Teachers College is the principal source of post-high school vocational education in South Dakota, the printing department at South Dakota State University has similar goals. The central purpose of Southern State College is teacher education. The College, established in 1881, is located in Springfield, approximately 40 miles west of Yankton on Lewis and Clark Lake. Although the College is essentially a teacher training institution, the South Dakota Legislature, in 1939, recognized that the institutions of higher learning in the state must provide the types of education which meet the needs of those whose interests are not parallel with a strict academic course of study. The Legislature therefore stated (Chapter 38, 1939 Session Laws) that the

> exclusive purpose of such normal schools shall be the instruction of persons, both male and female, in the art of teaching and in all the various branches that pertain to a good common school, vocational training and high school education; also to give instruction in the mechanical arts, husbandry, agricultural chemistry, the fundamental laws of the United States, and the rights and duties of citizenship. Provided, that the Board of Regents shall determine which, if any, of such normal schools shall engage in the instruction of persons in the art of vocational training and teaching in high schools.

The first such program, and the oldest at Southern, is the industrial arts program. The second is the two year terminal program, in which all vocational education courses are included. The third, a pilot program instituted in the fall of 1963, is the vocational education teacher training program. The pilot program leads to a degree in education with a major in vocational education. This degree can be earned in one of two ways. First, a student can take the regular four year course and, second, a person who has served as an apprentice in a trade for three years may substitute this training for 32 semester hours credit, thereby completing the degree program in six semesters or three years. The students in the latter category are required to take a trade competency examination, graded by proper officials, before the credits can be waived.

The pilot program has been approved by the state Board of Vocational Education and by the American Vocational Association. In addition, the College itself has received provisional accreditation from the National Council for Accreditation of Teacher Education and from the North Central Association of Colleges.

In many respects the two year terminal program at Southern is similar to an area vocational school. The essential distinction, however, is that students at SSC enrolled in the terminal program must have a high school diploma or have passed the GED (General Educational Development, a high school equivalency test). To qualify for GED certification, the student must be either 21 years old or have completed his military obligation. On the other hand, at strictly area vocational schools students normally must only be 16 years old and there is no requirement for a high school diploma. There are two schools of thought concerning area vocational schools and high school drop outs. The positive school contends that many students inevitably drop out of high school and quickly grow tired of low paying jobs. Many of these are too young for military service and since area-vocational schools admit students 16 years old, they are able to continue their education. On the other hand, the negative school is of the opinion that the 16 year limit at area-vocational schools prompts many young people to drop out of high school. They say that many 16 and 17 year olds are academically capable, but the prospect of completing their education in a more abrupt manner is too enticing.

In addition to standard vocational education courses, those enrolled in the terminal program at Southern are required to take courses in related subjects such as communications, technical mathematics, and science. The reason for this requirement is that in the rapidly increasing technological world no person could be truly skilled without a background in mathematics and science, at least.

The industrial arts program will not be discussed in this paper, since this program is distinct from the vocational education program at Southern. Enrollment at Southern in vocational education and industrial arts is as follows: two year trade terminal program, 166; four year pilot program in vocational education teacher training, 6; and industrial arts, 63. An analysis of vocational education majors at Southern, that is, those seeking a baccalaureate degree is as follows:

Course of instruction	No. of students
Carpentry	2
Automotive	2
Diesel	1
Electronics	1
Total	6

An analysis of those enrolled in the two year terminal program is presented below:

Course	No. of students
Automotive	67
Body Repair	15
Machine Trades	5
Drafting	14
Diesel	9
Electronics	25
Carpentry	27
Upholstery	4
Total	166

At the present time, there are a total of 172 students enrolled at Southern in the vocational programs as such. According to the director of vocational education at Southern, Mr. Emmett B. Oleson, the department has a present capacity for 210 students, and with the addition of one carpentry instructor, the school could train 237 students in vocational education. It should be added that in addition to vocational education and industrial arts programs at the school, there are approximately 85 students enrolled in the secretarial program. Although this is a branch of the business department, it is a form of vocational education, strictly speaking.

Courses of instruction in the vocational education department at SSC include the following: diesel, upholstery, carpentry, drafting, automotive, machine trades, secretarial, body repair and electronics. In addition, industrial arts courses are offered in a number of fields such as radio and television and drafting.

However, it has been expressed by the director of the department that the school could do much more to fulfill the needs of the employers of the state of South Dakota. He suggested that the department be broadened to include the following courses: welding, air conditioning and refrigeration, aircraft mechanics, and chef and hostess training. It was also suggested that the department expand its building trades program to fit the needs of the state.

Various employers within and outside the state have requested that the school offer courses in bricklaying, cosmetology, small appliance repair, baking, and barbering. These requests are made known to the director of the department by an advisory committee consisting of management and labor. The committee meets at least once a year and advises the department as to the needs of industry and the type of trained technicians which are in demand. In addition, representatives from industry periodically visit the school to inform the instructors of the latest innovations in their respective fields.

Since SSC is a state institution of higher learning, funds for operating expenses and salaries come from appropriations by the state Legislature. General legislative appropriations for Southern (including deficiencies) from 1947 through 1964 have been:

1947	$ 135,500.00
1949	205,818.00
1951	256,652.00
1953	322,576.00
1955	362,400.00
1957	440,500.00
1959	403,290.00
1961	465,900.00
1963	710,500.00
1964	140,000.00

In addition, the Legislature has voted for a number of special appropriations to renovate and construct buildings for the Vocational Education and Industrial Arts departments at Southern. The special appropriations from 1947 through 1961 for this specific purpose have been:

1947	Industrial Arts Building	$ 100,000.00
1949	Addition to Industrial Arts Bldg.	6,000.00
1949	Tools and Equipment	10,000.00
1951	Tools and Equipment	15,000.00
1951	Automobile Mechanics Bldg.	120,000.00
1955	Addition to Automobile Mechanics Bldg.	90,000.00
1961	Shop Building	135,000.00

In the past, federal funds for vocational training at Southern have been negligible. For fiscal 1961, 1962 and 1963, federal funds for the school totaled $8,659.00, $3,256.00 and $3,438.00, respectively. Under a prior agreement the school will receive no federal funds for fiscal year 1964. The purpose of granting the college federal money in the past has been to establish certain programs. On the other hand, it may be that Southern will be a beneficiary of federal funds through the Perkins Act.

Tuition at Southern is the same for all students, including the terminal students who receive no college credit for their work. This amounts to $99 per semester for state residents and $233 per semester for out of state residents. Also, there are fees of $75 to $80 per year which must be paid by both resident and non-resident students.

In addition to state and federal funds, the vocational education department at Southern receives assistance in the way of operating equipment from companies such as Ford Motors and General Motors. However, this assistance is restricted to equipment and does not extend to direct financial aid. Nonethe less, the director of the department has said that without

these donations from industry, the school could not hope to maintain its vocational education department.

Expenses for operation of the vocational education department at SSC for 1963 can be itemized as follows:

Salaries	$ 95,787.00
Operating expenses	8,215.00
Expenditures for shop building construction fund	1,610.73
Total	$ 105,612.73

According to the director of vocational education, Emmett B. Oleson, there is presently a need at SSC for a new building which would house the electronics, drafting, upholstery and possibly secretarial training programs. There is also a need for new equipment in the areas of drafting, building trades and electronics. It has been estimated that the new building alone would cost between $300,000.00 and $350,000.00. In addition 28 acres of land required for the building and parking space would cost the state between $15,000.00 and $20,000.00.

Proposal for Changing SSC to a Purely Vocational Education Institution

The suggestion has been made that Southern State College become a purely vocational school and that the teacher training duties of the college be surrendered. This suggestion has met with considerable opposition from the faculty and administration at Southern, from the students and alumni of Southern and from the Board of Regents. While the purpose of this paper is not to discuss the merits or faults of such a proposal, the arguments of the proponents and opponents should be summarized in brief form. Essentially speaking the proponents of the measure contend that Southern should become a vocational school because there is a need for more vocational education in South Dakota; because Southern is the only school in the state equipped to provide such training; and because the teacher training programs of other colleges and universities in the state are sufficient to meet the teacher needs of South Dakota.

Those opposed to the suggestion argue that the school has traditionally served the teacher needs of a certain area of the state, in fact, Southern produces more teachers per year than any other college in the state with the exception of Northern State College. A second argument of those opposed to the measure is that students, even vocational education students, should receive a well rounded educational background. This would not be possible in a strictly vocational education school. It is also said that the pilot program at Southern for training of vocational education teachers could not exist without the other departments of the college. A final argument is that vocational education schools per se normally

have few, if any, coeds, and it cannot be denied that this is a central attraction at any school. Those in favor of preserving the status quo at Southern say that enrollment would drop sharply if the College became a strictly vocational school.

Printing Program at SDSU

There are four different programs in the field of printing at State University, however, only the first two can be classified as vocational education, since they are non-baccalaureate. The first such program is simply practical shop work at the trade school level, for which there is no college credit. Presently there are nine students enrolled in this course of instruction. The second program is one in which students are enrolled in regular college classes such as math and English, in addition to the printing courses. These students are awarded certificates at the end of two years study. The third program is a four year course in printing management leading to a B. S. degree and finally, students with a B. S. in printing may work toward a M. S. in printing management.

During the current academic year there are a total of 52 students enrolled in all undergraduate programs in printing at State University and 4 students are doing graduate work in this field. The University anticipates 25 additional freshmen in the program next fall and the maximum enrollment would be 40 new students a semester. The department has all the standard printing equipment, including ten linotypes or composing machines. Because of overlapping duties (instructors in printing also work in the journalism department) the number of instructors and the expenses for the printing department at State University can only be estimated. However, there are approximately 5 instructors in the printing department and a reasonable estimate of the cost of operating the department would be in the neighborhood of $42,400.00 per year. Of this total, $35,000.00 is for salaries; $2,000.00 for supplies; and $5,400.00 for equipment rental and depreciation. Revenue to the printing department at the College comes from state appropriations, local and endowment funds, and income from the printing production which the laboratory completes for various college departments and activities.

VOCATIONAL EDUCATION IN SOUTH DAKOTA SECONDARY SCHOOLS

The State Board of Vocational Education is primarily responsible for vocational education in the state of South Dakota. The State Board of Education is ex officio the State Board of Vocational Education. The Superintendent of Public Instruction acts as ex-officio secretary and executive director of the Board without the power to vote. It is the duty of the Superintendent to attend to all records of the state Board. In addition, the Superintendent is responsible

to the U. S. Office of Education for compliance with federal regulations concerning vocational programs which are subsidized by the federal government.

Another duty of the Superintendent is to employ members of the staff of the division of vocational education in the Department of Public Instruction, whose salaries are fixed by the State Board. The division, as the administrative arm of the State Board, has duties which include: assist the Superintendent in the administration of all vocational education programs; write the state plan for vocational education; prepare reports for the U. S. Office of Education; provide informational material for all interested persons; approve vocational instructors at the local level; insure that local schools are operating vocational programs in compliance with the state plan; and, approve local schools for federally reimbursed funds.

Vocational education programs administered by the Department of Public Instruction are financed by the federal government and by local school districts. The state government merely pays the cost of administration, which in recent years has averaged roughly $18,000.00 annually. In order to receive federal funds, a school's vocational program must meet the requirements established in the state plan of operation, which in turn must meet certain federal standards. As a result, not every vocational course in the state's high schools is federally subsidized.

There are three purposes of the vocational education programs which are channeled through the Department. The first purpose is the training of high school students for a certain trade or occupation. The second purpose is to allow persons already on the work force to improve their skills so that they might increase their financial security and at the same time be of more benefit to the economy of the state. The final goal of these programs is to train persons in a skill to which they have never been exposed. The latter type of training could apply to two groups: those already employed but who may lose their jobs due to automation; and those in the ranks of the unemployed.

The following tabulation shows enrollment numbers in all vocational programs administered by the Department of Public Instruction for fiscal year 1963 (statistical data from the Department):

Course	In-School Programs	Out of School-Adult	Total
Agriculture	3,036	2,057	5,093
Distributive	132	604	736
Home Economics	5,724	654	6,378
Trades & Industry	492	1,636	2,128
Practical Nursing	0	114	114
Technical	12	184	196
Total	9,396	5,249	14,645

The number of schools in South Dakota which conducted vocational education programs during fiscal 1963 and which are administered by the Department of Public Instruction are listed below:

Course	In-School Programs	Out of School-Adult	Total
Agriculture	75	43	118
Distributive	7	9	16
Home Economics	104	21	125
Trades & Industry	6	14	20
Practical Nursing	0	3	3
Technical	0	4	4

The total number of schools with such programs is 120.

A form of vocational education that is quite widespread in other sections of the country is the part-time cooperative program. Under this program students spend half the day in school and the other half learning a skill, under the sponsorship of an individual or a group. During the 1962-1963 academic year there were 65 high school seniors who completed training in trade and industrial education and gradutated from high school. At the same time these students earned $57,200.00. In addition, 84 high school seniors completed training in vocational distributive education, gradutated from high school and earned a total of $86,520.00 in the process.

A complete analysis of the number of public high schools offering and the number of students enrolled in the various vocational courses during the 1962-63 school year is presented below:

The non-public or parochial schools do not receive federal funds for the operation of vocational education programs.

Cost of Vocational Education at Secondary Level in South Dakota

The entire field of vocational education represents an expensive venture. Vocational education is considerably more expensive than standard classroom instruction for two reasons: first, vocational classes must be small in number and this results in higher per pupil costs; and second, equipment used in most vocational classes is expensive. Federal allotments to

South Dakota for fiscal year 1964, under the Smith-Hughes Act and the George-Barden Act are presented below:

Agriculture	$ 170,944.33
Distributive	15,000.00
Home Economics	63,058.34
Trades & Industry	53,333.33
Practical Nursing	43,801.00
Technical	31,403.00
Total	$ 377,540.00

The amount actually spent during fiscal year 1963 for vocational education programs, subsidized in part by the federal government, is as follows:

Course	Federal	State	Local	Total
Agriculture	$ 173,740.18	$ 12,355.41	$ 229,039.34	$ 415,134.93
Distributive	15,201.43	482.23	18,086.47	33,770.13
Home Economics	63,057.43	16,090.60	355,975.25	435,123.28
Trades & Industry	53,326.65	13,546.29	80,918.80	147,791.74
Practical Nursing	33,961.53	61.96	33,949.84	67,973.33
Technical	2,767.25	0	2,767.25	5,534.50
Total	$342,054.47	$42,536.49*	$720,736.95	1,105,327.91

* State funds include $20,548.69 from the Department of Public Instruction; $13,276.28 from South Dakota State University; and $8,711.52 from Southern State College.

The schools which participated in these federal programs were reimbursed by the Department of Public Instruction in the following percentages: agriculture, 40.9495; distributive, 44.14; home economics, 11.5182; trades and industries, 28.300; and both practical nursing and technical, 50.00.

This section can be summarized by listing expenditures according to function and for each particular type of vocational education. The tabulation, for fiscal 1963, is presented as follows:

	Total	State	Local	Federal
Agriculture				
Administration	$ 14,779.30	$ 7,711.48	$	$ 7,067.82
Teacher Education	9,287.86	4,643.93		4,643.93
Reimbursement-Schools	391,067.77		229,039.34	162,028.43
Total	$415,134.93	$12,355.41	$229,039.34	$173,740.18
Distribution				
Administration	$ 782.28	$ 482.23	$	$ 300.05
Teacher Education Reimbursement-Schools	32,987.85		18,086.47	14,901.38
Total	$ 33,770.13	$ 482.23	$ 18,086.47	$ 15,201.43
Home Economics				
Administration	$ 14,460.23	$ 7,458.25	$	$ 7,001.98
Teacher Education	17,264.71	8,632.35		8,632.36
Reimbursement-Schools	403,398.34		355,975.25	47,423.09
Total	$435,123.38	$16,090.60	$355,975.25	$ 63,057.43
Practical Nurse				
Administration	$ 73.68	$ 61.96	$	$ 11.72
Teacher Education Reimbursement-Schools	67,899.65		33,949.84	33,949.81
Total	$ 67,973.33	$ 61.96	$ 33,949.84	$ 33,961.53
Technical - Title III				
Reimbursement	$ 5,534.50	$	$ 2,767.25	$ 2,767.25
Trades and Industries				
Administration	$ 9,198.61	$ 4,834.77	$	$ 4,363.84
Teacher Education Reimbursement-Schools	138,593.13	8,711.52	80,918.80	48,962.81
Total	$147,791.74	$13,546.29	$ 80,918.80	$ 53,326.65
Grand Total				
Administration	$ 39,294.10	$20,548.69	$	$ 18,745.41
Teacher Education	26,552.57	13,276.28		13,276.29
Reimbursement-Schools	1,039,481.24	8,711.52	720,736.95	310,032.77
Total	$1,105,327.91	$42,536.49	$720,736.95	$342,054.47

It should be apparent that the average high school in South Dakota does not have a very extensive vocational education program. Most high schools in the state offer courses in homemaking, vocational agriculture and possibly woodworking. Only the larger schools, such as Pierre High School, are able to include in their curriculum courses in electronics, drafting, welding, metals, aeronautics, power mechanics and electricity. There are many reasons, almost all economic, why the smaller high schools in South Dakota are unable to offer a broader vocational curriculum. One of the main reasons is that vocational education, for the most part, is much more costly than standard courses of instruction. Equipment, tools and supplies, especially in courses such as automobile mechanics and welding, are extremely expensive. Another reason for the relatively high cost of vocational education is the fact that these classes must, of necessity, be small in number; this results in greater per pupil expenditures. A final reason is that in small high schools there are simply not enough students interested in particular vocational subjects to merit full course time by an instructor.

Adult Vocational Education in Secondary Schools

The state division of vocational education is concerned with adult vocational education as well as high school vocational training. The division also provides instructional training for MDTA, ARA, and certain apprenticeship programs; these will be described in the following section. Following is a summation of adult vocational training administered by the division; all of these programs are conducted in local high schools.

Enrollment	Type of Instruction
712	Trade and industrial evening classes
101	*Foremen in supervisory classes
125	Practical nurse training classes
401	*Trade and industrial classes in which schools met all standards but were not reimbursed because of a lack of funds
325	*Job training and safety instruction for power linemen
290	Job training and safety instruction for gas servicemen
102	*Job training and safety instruction for telephone servicemen
178	*Custodians attended custodian schools
101	*Firemen given safety training
77	Technical education under Title III Program
686	Distributive education evening classes
438	Distributive education classes in which schools met all standards but were not reimbursed because of a lack of funds

* These programs are financed on a 50-50 basis by cooperating industries and the federal goverment. The remainder are jointly financed by local school districts and the federal government.

APPRENTICESHIP, MDTA, AND ARA PROGRAMS

Apprenticeship Programs

Apprenticeship programs in South Dakota are organized and administered by a number of different groups. For the most part, however, these programs are joint ventures of labor and management. Apprentices in all trades are required to take evening classes two or three nights a week, in addition to on-the-job-training. Where adequate facilities are available, the instruction is ordinarily conducted in local high schools, in conjunction with the Department of Public Instruction. Fifty per cent of the instructional costs are supplied by the U. S. Department of Health Education and Welfare, through the Smith-Hughes and George-Barden Acts, and the remaining fifty per cent is paid by labor and management, in areas where labor is organized, and by management alone, in areas where labor is unorganized. During fiscal 1963 there were 213 apprentices enrolled in evening classes in the state's high schools.

In areas of the state where adequate facilities for off-the-job instruction do not exist, apprentices normally take extension courses. Many of the apprentices in this classification are registered with the Bureau of Apprenticeship and Training, a federal office which works with labor and management in an effort to organize apprenticeship programs. Since January 1, 1964, there have been 437 apprentices enrolled in organized trade classes which are registered with the Bureau of Apprenticeship and Training. This number does not, however, represent all apprentices in South Dakota, since the only apprenticeship programs which must register with the Bureau of Apprenticeship and Training are those associated with federal construction projects.

Most apprenticeship programs are four to five years in duration; however, a person who has attended a vocational school such as Southern State College, if qualified, can sometimes receive a partial waiver of the requirement. Virtually all apprenticeship programs in South Dakota require a high school diploma or passage of a high school equivalency test.

Although the general impression appears to be that apprenticeship programs are designed for men only, nearly half of all apprentices registered with the Bureau of Apprenticeship and Training are women. There are presently 196 women apprentices registered with this federal office. Some of the occupations in which women are serving an apprenticeship include: baking, cooking, nursing, and meat cutting.

Some of the particular trades which are employing a large number of apprentices are as follows: plumbers and pipefitters, 71; sheet metal workers, 65, electricians, 46; bricklayers, 29; carpenters, 47; painters, 20; roofers, 16; asbestos workers, 16; and cement finishers, 15.

ARA and MDTA Programs

The Area Redevelopment Act, passed by Congress in 1961, is designed to assist areas experiencing chronic unemployment and underemployment. The Manpower Development and Training Act of 1962, on the other hand, is intended to provide training opportunities for all areas of the nation. In both programs instruction is provided in local high schools through the Department of Public Instruction. ARA programs are financed entirely by the federal government, while MDTA programs, previously financed entirely by the federal government, will be on a state-federal matching basis beginning with fiscal year 1966.

During fiscal year 1963 the following types of training were carried out in the state under the Manpower Development and Training Act:

Fifty-two week course in automobile mechanics at Sioux Falls
Fifty-two week course in household appliances at Sioux Falls
Fifty-two week course in body fenders at Rapid City

Area Redevelopment Programs in South Dakota during fiscal year 1963 were as follows:

Sixteen week course in carpentry at Pine Ridge
Three eight week sections in arts and crafts at Standing Rock
Two eight week sections in arts and crafts at Rosebud
Two sixteen week sections for clerk-typists at Rosebud
Six week course for cooks and bakers at Pine Ridge

PRIVATE, NON-SECONDARY VOCATIONAL INSTITUTIONS

Vocational education in South Dakota's private, non-secondary institutions is limited; most of the institutions fall into one of three different categories: business schools, beauty schools and barber schools. These schools are the result of profit motivation and by their very nature are distinct from public institutions.

National School of Business in Rapid City is a representative commercial or business college in South Dakota. The School is located in a modern, two story classroom building with enough space for 400 students. The classrooms are equipped with modern equipment and office machines. A new girls' dormitory is being constructed and will house some 120 students. The existing classroom building will be expanded so that the school can accomodate 800 students this fall. Long range plans call for a new classroom building which will increase student enrollment to 1,200. Future plans also indicate that a men's dormitory will be built, housing 120 students.

At the present time there are 289 students enrolled at the college. Anticipated enrollment for the fall of 1964 is 450-500 and for the fall of 1965, 600. Courses of instruction are offered in accounting, business administration, secretarial science, clerical and office machines. The school employs 11 instructors and 2 more will be added in September of 1964. The School is accredited by the Accrediting Commission for Business Colleges. Tuition ranges from $615.00 for a 24 week course in clerical studies and office machines to $1,660.00 for a 96 week course in senior business administration and higher accounting.

The Stewart beauty salons are representative of the type which exist in South Dakota and elsewhere. There are three branches in this state; two at Sioux Falls and one at Aberdeen. The three schools have a combined capacity of 300 students; however, enrollment in the past few years has been between 175 and 200. According to the director of Stewart beauty salons, the demands of the beauty industry in South Dakota are being met by present graduates from Stewarts beauty salons and by graduates from other beauty schools in the state. Tuition at the schools is $506.50 for an 11 month course. There is one instructor for every 20 students and the schools receive no monetary or other grants from private or governmental sources.

The South Dakota Barber College in Sioux Falls presently enrolls 12 students. Facilities are those of a modern barber shop. There are no plans to expand enrollment or facilities. Tuition, including implements, is $500.00 for the full course of instruction. Courses taught include: fundamentals of barbering, hygiene, sanitation, sterilization, dermatology, meurology, muscles, anatomy, basic chemistry, diseases, haircutting, shaving, shampooing, facial and scalp massage and hair coloring.

In a separate category is Golden Leaf Farrier's College in Sturgis. Essentially this is a school which instructs students in the art of farriery or blacksmithy. During 1963 there were 35 students enrolled in the program. The course of instruction is 12 weeks in length and tuition charges are $600.00. Anticipated enrollment for the next few years is 36 to 45 students per year. There are four instructors employed at the school, one of whom is a licensed veterinarian. Although farriery is the primary course taught, students are also instructed in machine work and animal anatomy.

VOCATIONAL EDUCATION IN OTHER STATES

Since the primary duty of state and local government is the education of young people, the field of vocational education has essentially been the concern of states and localities. Vocational education has been a concern of these governments since the latter part of the 19th century. Quite naturally, the first publicly owned and operated vocational education programs in the country were located in the industrial northeast.

There are many different forms of vocational education being conducted in the various states of the nation. Although vocational education is, for the most part, carried on in the high schools of the state of South Dakota, this is not necessarily the case with other states. The established practice in a majority of states has been to conduct the balance of this type of education in vocational-technical, or area vocational schools. Most of these schools serve a particular economic sphere of their state and for the most part they are post-secondary institutions in which the student may learn a trade in one, two or three years.

In 1960 there were about 250 area vocational schools in the United States and its territories. These schools were operated in 29 states and two territories. In addition, 8 states operated area vocational schools through established junior colleges. In most of these, junior college students may take one of two approaches; they may take a college preparatory course which enables them to transfer to a university or they can take a straight technical course which prepares them for a trade or technical skill. By 1960, 15 states had passed laws authorizing the establishment of state operated or administered area vocational schools and 12 states had provisions in their statutes enabling local schools to operate area vocational schools on a cooperative basis. There were, in 1960, only ten states in the nation which had no legal provision for technical, area vocational education. South Dakota was one of these ten states.

Technical schools are not restricted to the industrialized areas of the country. There are many of these schools in rural areas of other states. Most of these schools, in industrial and rural areas, are established along one of the four following patterns:

1. Creating a county vocational school for residents of the county and administering the school through the county board.

2. Creating vocational schools which may cross county lines, and which are operated on a cooperative basis by two or more districts.

3. Creating a vocational school which extends the operation of the school district to a wider area and a larger number of students.

4. Creating an area vocational school, owned and operated by the state itself.

Vocational Education in Neighboring States

Vocational opportunities in South Dakota, North Dakota, Wyoming, Nebraska and Montana are very much the same. In each of these five states, the bulk of vocational training is carried out in secondary schools and each of the states has one primary post-secondary institution for vocational education. In South Dakota, of course, this institution is Southern State College.

In the state of Wyoming the only post-secondary institution is Casper Junior College. Enrollment in all vocational courses at this college totals 118. Courses are offered in practical nursing, automobile mechanics, electronics, body and fender repair, police training and distributive education. Most of these courses are two year programs. According to the authorities at the college, the enrollment in automobile mechanics and distributive education is expected to increase within the next few years; however, the other programs will probably remain stable. The only expansion in facilities will be an addition to the automobile mechanics shop. Sources of financial assistance are local taxes, state and federal reimbursement and tuition. The college also offers night courses under the Manpower Training and Development Act. There are a total of 13 full-time instructors employed in the department.

In Montana all post-secondary vocational education is at Northern Montana College in Havre. The Vocational-Technical Division at this college has an enrollment of 289 students, of which 240 are in the two-year vocational-technical programs and 49 are in the secondary education with industrial arts as the major program. Courses offered in one and two year programs include: agricultural technology, farm and ranch management, office management, automotive machanics, carpentry and construction, cosmetology, diesel technology, distributive education, drafting, electrical technology, electronics technology, machine shop, practical nursing and welding. In addition, secretarial science is offered, including general, legal and medical. The budget for this division for 1963-1964 was $18,398.06, exclusive of staff salaries. Sources of financial assistance are the State Department of Public Instruction and federal funds for which they qualify. Finally, there are 15 instructors employed in the vocational-technical division at Northern Montana College.

The Vocational Technical School at Milford, Nebraska is one of the best equipped and most well known schools of its nature in this section of the country. Created by the Nebraska Legislature in 1942, the school is operated through the State Board of Vocational Education. It is a two year, post-secondary, non-college credit, terminal school for young people interested in 11 different areas of training. For the 1963-65 biennium the state Legislature appropriated $543,000.00 for operational

purposes. These funds, along with tuition fees charged each student ($125.00 per semester for residents and $250.00 per semester for non-residents) comprise the operating funds for the school. In addition, the school has of late been the recipient of limited federal funds. This year there were 575 full-time students enrolled at Milford (giving the institution $143,750.00 from tuition charges) and the anticipated enrollment for the fall of 1964 is 625. Including the enrollment under the Manpower Development and Training Act (98), the total enrollment at Milford at the present time is about 670. Under MDTA and the Smith-Hughes and George-Barden Acts, Milford will receive approximately $140,000.00 for the period from July, 1963 until June, 1964.

The Nebraska school has a waiting list two or three times larger than the number which will be able to enroll as freshmen next year. For this reason, an Interim Committee of the Nebraska Legislature is studying the need for additional vocational technical schools. The present enrollment capacity at Milford is 700 and with the addition of night classes, it is believed that 1,000 students could receive training at the school each year. According to the director of the school at Milford, Mr. Lowell Welsh, it is highly likely that a new vocational-technical school will be constructed in western Nebraska in the near future. Courses at Milford are offered in the following areas: auto mechanics, auto body, building construction, diesel technology, drafting, electrical technology, electronics, metals technology, air-conditioning, welding and metallurgy technology, and data processing and computer programming. The Nebraska school has a faculty consisting of 38 instructors.

The North Dakota State School of Science at Wahpeton opened its doors to students in 1903; however, it was not until 1922 that the Trade and Technical Division of the school was in operation. This school, the primary vocational institution in North Dakota, consists of four major divisions; technical division, trade division, junior college and business school. It is a public institution, under the jurisdiction of the State Board of Higher Education. Enrollment for the current academic year is 1760 and of this total, about 1,000 are in the technical and trade divisions. The trade and technical schools accept non-high school graduates, although a recent survey of the student body indicated that more than 90 per cent were high school graduates.

The total operating budget for the North Dakota School of Science was $2,056,575.00 for the ensuing biennium. This consists of the Legislative appropriation, some federal monies, student fees and Land Grant monies. The School has a total of 190 employees, of which 100 are teachers and members of the administrative staff. Tuition for North Dakota residents is $216.00 per year and $426.00 for non-residents. About half

of the instructors at the School have Bachelor or Master degrees, but primary emphasis is on technical skill.

The North Dakota School offers an extensive curriculum in all four major divisions. In the trade division, eighteen month terminal programs are offered in auto body repair, auto mechanics, printing, machine shop and welding and sheet metal, heating and air conditioning. The trade division also offers programs of less than 18 months in diesel maintenance, general mechanics and diesel maintenance, plumbing and practical nursing. The technical division includes eighteen month programs in building construction, electrical technology, civil technology, electronic drafting, electronics technology, industrial drafting and design technology and refrigeration and air conditioning technology.

The junior college division offers courses in pre-dentistry, pre-nursing, medical technology, data processing, pre-engineering, printing-journalism and home economics, among others. Finally, the business school has programs in stenography, office training, secretarial training, bookkeeping and business practice.

The annual reports of the state boards for vocational education, submitted to the U. S. Office of Education, serve to clarify the various vocational education programs in South Dakota and its neighboring states; the various statistical comparisons for fiscal year 1962 from the Office are presented below. The programs listed below are all federally subsidized, and are all channeled through the state departments of vocational education.

Total Enrollment in all Vocational Education Classes

Montana	10,199
Nebraska	31,122
North Dakota	17,146
South Dakota	13,062
Wyoming	7,072

Enrollment in Various Courses

NEEDS AND INADEQUACIES OF VOCATIONAL EDUCATION IN SOUTH DAKOTA

General

Not every young person can expect to receive a college education and not every young man or woman is capable or desirous of doing college level work. Many young people are inclined toward skilled or technical work and not professional or managerial work. The state of South Dakota must be prepared to educate those destined for vocational work as well as those who will someday do professional work. This matter is of extreme significance to the individuals affected and to the economy of the state and nation.

One of the results of inadequate vocational training is unemployment. Although South Dakota has one of the lowest unemployment rates in the nation, according to the February

report of the South Dakota Employment Security Department, the state's civilian work force reached its lowest monthly total since February, 1960. In addition, non-agricultural employment in South Dakota from January to February, 1964 experienced its sharpest reduction since 1958. The total civilian work force dropped by an estimated 2,050 persons and those employed in non-agricultural occupations were reduced in number by 600.

Unemployment is much more serious in other states of the nation. This problem is especially acute amongst young people. In fact, a recent study of the Upjohn Institute revealed that since 1958 one out of every seven male youths aged 18-19 has been unemployed. In 1953 the unemployment rate among 18 and 19 year olds was six per cent; by 1962 the rate had risen to 12 per cent. The following chart indicates the nationwide unemployment rates among 18-19 year olds and among older persons:

Source: "Youth Employment Act," by Sar A. Levitan. Published by the W. E. Upjohn Institute for Employment Research, February, 1963.

There are many other factors besides inadequate vocational education which contribute to unemployment. One of these factors which is of particular significance to South Dakota is agricultural mechanization. Mechanization leads to a situation where fewer man hours are needed to operate farms. A result in turn is that many farm youths migrate to the city, are not trained for specific occupations, and join the ranks of the unemployed.

It has also been contended that there is an indirect connection between inadequate vocational education and juvenile delinquency and increased welfare costs. Many young people, especially in larger cities, find themselves out of work and as a result turn to less productive activities. This in turn results in increased costs for law enforcement and for welfare.

While juvenile delinquency and welfare expenditures may seem remotely connected to inadequate vocational education in the state of South Dakota, it seems apparent that, to some degree, the employer needs of the state are not being met. A December, 1963 survey of the South Dakota Employment Security Department revealed that over 900 workers would have to be trained in the next two years, in order to satisfy the needs of the state's employers. It is possible that the employers answering this survey were somewhat optimistic insofar as their future needs are concerned, but at the same time it should be pointed out that the survey only covered employers hiring 38 per cent of the state's non-agricultural workers, and of this total only 71 per cent of said employers responded. Therefore, the statistics presented below represent the opinions of employers hiring little more than 25 per cent of the state's non-agricultural workers.

Occupation	Trainees Needed in 1964	Trainees Needed in 1965
Clerk, General Office	19	13
Draftsman	15	13
Bookkeeper	69	50
Stenographer	39	22
Cook	59	53
Nurse Aide	116	108
Practical Nurse, Licensed	59	49
Auto Mechanic	62	41
Welder	13	8
Auto Body Repairman	25	17
Carpenter	19	10
Painter	10	5
Asbestos Worker	7	10
Heavy Equipment Operator	8	6
Total	520	405

To clarify the demand which exists for trained technicians in skilled occupations, the following tabulation indicates employer anticipated needs during the next two years by broad occupational groups. This tabulation is also based on a survey by the Employment Security Department.

Employer Anticipated Needs in the Next Two years, by Broad Occupational Categories

Category	1964 Men	1964 Women	1965 Men	1965 Women	Total Men	Total Women
Professional & Managerial	73	103	53	99	126	202
Clerical	130	590	83	471	213	1,063
Sales	468	382	306	285	774	667
Services	131	770	114	632	245	1,402
Skilled Occupations	570	7	355	11	925	18
Unskilled	253	35	158	24	411	59
Unclassified	21	1	10	0	31	1

In connection with employer needs, the same survey of South Dakota employers revealed that under existing vocational programs, there were certain needs that simply could not be filled. These anticipated unfilled needs are presented below:

Skilled Occupations	Total Anticipated Need 1964	Total Anticipated Need 1965	Total Needs Not Able to Fill 1964	Total Needs Not Able to Fill 1965
Baker	9	6	5	3
Seamstress	1	2	1	2
Tailor	1	1	0	0
Cabinetmaker	1	0	0	0
Planing-Mill Operator	1	0	0	0
Pressman & Make-up	6	12	4	8
Linotype Operator	2	1	2	1
Watch Repairman	1	0	1	0
Automobile Mechinist	6	5	3	1
Tool and Die Maker	1	0	1	0
Sheet Metal Worker	4	4	1	1
Welder	43	23	13	8
Electrician	4	2	1	0
Optician	1	2	1	2
Concrete Batcher	1	1	0	0
Mason	2	0	0	0
Tuckpointer	6	6	6	6
Bricklayer	2	2	2	2
Carpenter	46	30	19	10
Form Setter	1	1	0	0
Truck-Box Assembler	3	4	0	0
Cement Mason	1	0	0	0
Cement Finisher	8	1	4	0
Painter	22	10	10	5
Plasterer	2	0	0	0
Plumber	8	9	1	0
Steam Fitter	2	2	0	0
Asbestos Worker	13	13	7	10

Skilled Occupations	Total Anticipated Need 1964	Total Anticipated Need 1965	Total Needs Not Able to Fill 1964	Total Needs Not Able to Fill 1965
Lineman	28	29	21	20
Dry Cleaner	2	2	0	0
Well Driller & Helper	4	0	0	0
Aircraft Mechanic	2	2	0	0
Aircraft Radar Repairman	2	2	1	1
Auto-Body Repairman	38	25	25	17
Auto Mechanic	120	80	62	41
Auto Electrician	5	2	4	1
Serviceman, Petroleum Equipment	1	1	0	1
Shop Mechanic	1	1	1	1
Truck Mechanic	1	1	0	0
Tractor Mechanic	3	0	1	0
Construction-Equipment Mechanic	3	2	1	1
Small Engine, Electric Motor Mechanic	1	1	1	1
Water Dept. Maintenance Man	1	0	1	0
Serviceman, Business Machines	2	4	0	0
Serviceman, TV	1	0	1	0
Electrical Appliance Serviceman	103	26	23	16
Total	580	368	198	154

These figures, based on only little more than 25 per cent of the state's employers indicate that during 1964 and 1965, a total of 352 skilled employees will be in demand but will not be available in South Dakota. The same survey showed that only 71 employees will be needed and not available in professional and managerial occupations, most of which require a baccalaureate degree. In addition, there will only be 63 semi-skilled positions and 10 positions in unskilled occupations that employers will not be able to fill, because of a lack of supply.

Vocational Needs in the State's High Schools

It is certain that Southern State College cannot hope to train all needed technicians in South Dakota. The state's secondary schools must play a major role in this field. It has already been suggested that there is a need for reorienting our vocational goals at the high school level. There appears to be too much emphasis in the high schools on vocational agriculture and too little emphasis on the other vocational fields. This is not to say that there is not a need for vocational agriculture education. Agriculture is the central industry in South Dakota but the curriculum imbalance is too much in favor of agricultural subjects. The reasons why other vocational courses are not stressed to any great extent in most of the state's high schools has already been discussed. To repeat, these reasons are economic for the most part; equipment for vocational courses is extremely expensive and classes, of necessity, must be small.

There appears to be a need for a basic reevaluation of vocational education goals. It is unrealistic for a high school to offer, as some do, two, three or four years of vocational agriculture and not one year of technical or trades education. The local school districts, in conjunction with the Department of Public Instruction, must adapt their curriculums to the needs of the state's employers.

PROPOSED ALTERNATIVES FOR VOCATIONAL EDUCATION IN SOUTH DAKOTA

Before considering alternatives for the improvement of vocational education in South Dakota, a number of proposed guidelines might first be observed by the Legislature and by all interested educators. These guidelines, seven in number, are:

1. A comprehensive survey of the needs of the employers of the state of South Dakota should be conducted (such a survey is currently underway in the Employment Security Department). This survey should encompass industrial, agricultural, distributive, nursing and other employers and should be projected for the next few years. In addition to determining the number of trained employees who will be needed during the next few years, the survey should discover the degree of training which will be needed for the various occupations.

2. A detailed inventory of the educational facilities of the state of South Dakota should be taken in order to learn if existing facilities are adequate to meet the needs of any proposed vocational education program.

3. Before any further vocational education programs are instituted in South Dakota, educational officials and others in positions of responsibility should consult with leaders in industry, business, agriculture, and labor.

4. Additional vocational education programs should not be started unless there is a clear cut need for trained employees which cannot be met by existing educational institutions and programs, public or otherwise.

5. If it is decided that the vocational education programs in South Dakota should be expanded, state officials should be in continual contact with leaders in business, industry, agriculture and labor in order to learn of qualifications needed for instructors, tools and facilities most practical and desirable training techniques.

6. In making any plans with respect to vocational education responsible officials should study the success or lack of success of graduates from existing programs in the state. It would also be wise to scrutinize closely the cost of vocational education programs as compared to the costs for other forms of state-financed education.

7. The Legislature should consider the feasibility of increasing cooperation between state supported vocational education programs and privately supported programs in vocational fields.

If it is decided that South Dakota should improve vocational education opportunities for its young people, attention naturally turns to economic factors. Almost any proposed alternative would require a fairly considerable capital investment. Attention should, however, be given to the long range effects of an improvement in vocational opportunities. One result of a good vocational program is the increase in the number of industries that locate in a state. North Carolina has recently introduced an extensive vocational education program and this investment has apparently paid off, since many industries are moving to that state. It is an established fact that one of the primary factors for industry location is the availability of trained manpower. Another result of an improved vocational program is the economic benefit to individuals, to families, to the state and to the entire nation. A third effect which would result from a good vocational program is decreased state outlays for welfare and for unemployment compensation. It has been established, to a certain degree, that there is a demand for skilled technicians and that the great majority of those who are unemployed and who are on welfare are unskilled. All of these effects are not immediate but they should be considered along with initial financial investments. Listed below are a number of possible alternatives for vocational education in South Dakota. These alternatives are not intended to be mutually exclusive. A combination of two or more alternatives may well be needed in South Dakota.

The first alternative which might be considered would be the expansion of vocational offerings at Southern State College. The vocational department at Southern presently has an enrollment of about 170 students and it has been suggested that with the addition of one more instructor the capacity would be nearly 240 students. Southern would seem to be one of the most reasonable and practicable institutions for the improvement of vocational education in South Dakota, since it has experienced and well trained administrators and instructors and the necessary, although limited, buildings and equipment.

A second alternative would be the improvement and expansion of existing vocational programs in the state's secondary schools, by taking full advantage of funds from the

Perkins Act and other federal vocational acts. This alternative, however, would require large capital investments and full equalization among the state's schools might possibly never be realized. Since it is possible that the state's smaller high schools may never be in a financial position to offer a broad range of vocation courses, this alternative would depend on the success of the school district reorganization movement.

A third alternative would be for the state of South Dakota to create area vocational schools. However, the expense involved would be somewhat comparable to establishing another higher educational institution in the state. As has been pointed out, equipment and supplies for these programs are quite costly and classes, by their very nature, must be small in number.

Another alternative would be to establish locally financed (perhaps with state assistance) county or multi-county vocational schools for local residents. One of the best arguments in favor of preserving and extending vocational opportunities at the local levels is that local administration is more flexible and more receptive to the needs of individual communities.

Still another suggestion has been that the state create junior colleges for the purpose of vocational education. Once again, the central criticism is that capital investments would be extremely high and it would seem more practicable to work with existing educational institutions.

The suggestion has been made that South Dakota cooperate with neighboring states for the purpose of educating its young people. Two of the nation's outstanding vocational institutions exist in Nebraska and North Dakota. Both the Vocational-Technical School at Milford, Nebraska and the State School of Science at Wahpeton, North Dakota are presently providing vocational education for some of South Dakota's young people, and the state of Nebraska may construct another vocational institution. A program of partial payment of the tuition and fees of South Dakotans attending these schools would be less expensive--although not necessarily more desirable--than construction and equipping of new facilities in this state.

Another partial solution to the problem would be for state officials to work with industrial and labor leaders in an attempt to expand and increase existing apprenticeship programs. Connected with this alternative is the suggestion that South Dakota encourage private groups and institutions to develop more vocational education programs.

The last alternative, although this presentation does not purport to exhaust all possibilities, is that South Dakota encourage federal passage of the Youth Employment Act. This Act is in the form of three measures introduced into the 88th Congress; S. 1, H.R. 1, and H.R. 1890. S. 1 would establish two separate programs; the first would create a youth conservation corps to provide jobs for young people and the second would authorize the Secretary of Labor to assist state and local governments, through grants, in developing job opportunities in local community service activities. Both of these programs resemble the Civilian Conservation Corps, established in 1933. The first program would attempt to provide employment for youths in depressed areas where both the financial resources of the community and the job opportunities are extremely limited. Because this work would be carried out on public lands, the federal government would finance the major portion of the program. The second program is designed for young people in areas where the communities would be able to provide half the needed revenue for the program. It has been estimated that the cost per enrollee would be about $5,000.00 per year. The young people would be paid for their work and would receive clothing, lodging, food, medical care and transportation. This "nationwide vocational school" would provide on-the-job training for about 15,000 young people during the first year of operation and in subsequent years, as many as 60,000 could be trained. The Act has two primary purposes; making young people more employable and alleviating the unemployment problem. The proponents of the "new-CCC" measure point to a number of advantages which could accrue from its passage: the unemployment problem would be lessened and young people would be provided with valuable vocational training; juvenile delinquency would be reduced; and public lands and local communities would be improved. According to a 1961 Gallup poll, 70 per cent of the American public supported the revival of youth conservation camps (the same poll reported that the CCC was consistently held to be the most popular New Deal measure).

On the other hand, those opposed to the Act say that there is no real unemployment problem that cannot be solved through economic prosperity. Some opponents of the measure say that the nation cannot afford the program, since the national deficit is already near $12 billion. Thirdly, they say that the program would provide inadequate training because young people could not be expected to work for eight hours and attend school at the same time (young people working in their own communities would be encouraged to remain in school). Finally those opposed to the Act say that juvenile delinquents would corrupt decent young people through their personal associations.

The alternatives presented in this section are by no means entirely comprehensive. There are no doubt other possibilities

for the improvement of vocational education in South Dakota. In addition, the alternatives mentioned in this section are not mutually exclusive or contradictory. It is conceivable that action will have to be taken on a number of alternatives before South Dakota's vocational opportunities are commensurate with the needs of the state.

APPENDIX I

HOUSE CONCURRENT RESOLUTION NO. 1, 1964

Introduced by MISS BLISS

A CONCURRENT RESOLUTION

A CONCURRENT RESOLUTION, Authorizing and directing the Legislative Research Council of the State of South Dakota to undertake a comprehensive study and analysis of vocational educational opportunities in South Dakota and to make its findings known at the next session of the Legislature.

BE IT RESOLVED BY THE HOUSE OF REPRESENTATIVES OF THE STATE OF SOUTH DAKOTA, THE SENATE CONCURRING THEREIN:

WHEREAS, There has been a greater need in the State of South Dakota and throughout the nation for education at all levels to prepare young people for the challenges of the future;

WHEREAS, The significant advancements in technology have resulted in a demand for more people to operate machines and other equipment requiring specialized training;

WHEREAS, These technological advancements have also resulted in more unemployment and underemployment, resulting in greater demands upon public aid;

WHEREAS, A thorough evaluation of the vocational educational opportunities in South Dakota cannot occur until an objective study and analysis of significant data and statistics is available; and

WHEREAS, The State Legislative Research Council is the research arm of the Legislature and has performed its research functions well with regard to other studies;

NOW, THEREFORE, BE IT RESOLVED, by the House of Representatives, the Senate concurring therein, that the Legislative Research Council study and analyze factors surrounding vocational educational opportunities in South Dakota and to report its findings to the Fortieth Session of the South Dakota Legislature.

APPENDIX II

ENROLLMENT IN AND EXPENDITURES FOR FEDERALLY SUPPORTED VOCATIONAL EDUCATION PROGRAMS, 1961

ENROLLMENT
(Numbers in thousands)

Occupational Category	Total	High School Students		Extension Programs	
		Number	Percent	Number	Percent

APPENDIX V

PUBLIC LAW 88-210
77 STAT. 405

Sec. 4 (a) Except as otherwise provided in subsection (b), a State's allotment under section 3 may be used, in accordance with its approved State plan, for any or all of the following purposes:

(1) Vocational education for persons attending high school;

(2) Vocational education for persons who have completed or left high school and who are available for full-time study in preparation for entering the labor market;

(3) Vocational education for persons (other than persons who are receiving training allowances under the Manpower Development and Training Act of 1962 (Public Law 87-415), the Area Redevelopment Act (Public Law 87-27), or the Trade Expansion Act of 1962 (Public Law 87-794)) who have already entered the labor market and who need training or retraining to achieve stability or advancement in employment;

(4) Vocational education for persons who have academic, socio-economic, or other handicaps that prevent them from succeeding in the regular vocational education program;

(5) Construction of area vocational education school facilities;

(6) Ancillary services and activities to assure quality in all vocational education programs, such as teacher training and supervision, program evaluation, special demonstration and experimental programs, development of instructional materials, and State administration and leadership, including periodic evaluation of State and local vocational education programs and services in light of information regarding current and projected manpower needs and job opportunities.

(b) At least 33 1/3 per centum of each State's allotment for any fiscal year ending prior to July 1, 1968, and at least 25 per centum of each State's allotment for any subsequent fiscal year shall be used only for the purposes set forth in paragraph (2) or (5), or both, of subsection (a), except that the Commissioner may, upon request of a State, permit such State to use a smaller percentage of its allotment for any year for the purposes specified above if he determines that such smaller percentage will adequately meet such purposes in such State.

(c) Ten per centum of the sums appropriated pursuant to section 2 for each fiscal year shall be used by the Commissioner to make grants to colleges and universities, and other public or nonprofit private agencies and institutions, to State boards, and with the approval of the appropriate State board, to local educational agencies, to pay part of the cost of research and training programs and of experimental, developmental, or pilot programs developed by such institutions, boards, or agencies, and designed to meet the special vocational education needs of youths, particularly youths in economically depressed communities who have academic, socio-economic, or other handicaps that prevent them from succeeding in the regular vocational education programs.

Facts about the Legislative Research Council

The State Legislative Research Council is a permanent, joint committee composed of every member of the South Dakota Senate and House of Representatives. Its purpose is to consider legislative policies between sessions of the Legislature. To achieve this purpose, the Council, during the interim between sessions, gives advance study and consideration to problems expected to confront the next Legislature.

The work of the Council is conducted by committees and subcommittees and by a research staff, under the direction of an Executive Board. The Council staff serves the Executive Board and committees and subcommittees in development of a program for consideration at the next legislative session, and serves every legislator in an impartial and objective fact-finding capacity.

In its work, the Executive Board: 1) acts as a clearing house for ideas on current legislative problems through receipt of proposals for study; 2) determines and directs the study and research necessary for proper consideration of all topics accepted; 3) disseminates advance information on these problems to legislators and the general public by means of reports and newsletters and by discussion at public meetings; and 4) reports directly to the Legislature in advance of regular sessions, making recommendations in the form of bills or otherwise, and summarizes the material prepared for use of the Legislature in considering the Council program.

Since 1951 the State Legislative Research Council has provided an open forum to which legislators, administrators, citizens, and organizations have submitted their proposals for consideration. As a result of Council activities, problems of South Dakota state and local government receive continuous attention and study by members of the Legislature.

Job Performance of Young Workers in Relation to School Background, A Pilot Approach Toward Using the Job Environment in Evaluating Both General and Vocational Education.

Bergstrom, Howard E.

Educ Res and Develop Counc of the Twin Cities Metrop Area

20Apr66

DOCUMENT NOT AVAILABLE FROM EDRS 217p.

*VOCATIONAL EDUCATION, *HIGH SCHOOL GRADUATES, *GENERAL EDUCATION, *PERSONNEL EVALUATION, PROGRAM EVALUATION, COMPARATIVE ANALYSIS, MALES, GRADES (SCHOLASTIC), EMPLOYMENT LEVEL, PILOT PROJECT, INDIVIDUAL CHARACTERISTICS,

The purpose of this study was to explore ways of using the work environment to appraise the effects of preemployment education -- both general and vocational education -- on subsequent job success. Data were collected from August 1964 to May 1965, and came from three primary sources -- (1) telephone interviews with 150 boys who graduated from three different types of high schools in 1963 but had obtained full-time work instead of continuing their formal education, (2) their official school records (class rank, grades in English and vocationally-oriented subjects, attendance records, and scores in intelligence and the Differential Aptitude Test), and (3) the employers of the 150 boys who were interviewed by the investigator at 123 places of employment. Each employer defined the job as being on one of four levels of difficulty, and indicated the order of importance of three clusters of characteristics -- (1) communication competency (valued most in 42 cases), (2) personal adequacy (valued most in 91 cases), and (3) skills unique to the job (valued most in 17 cases). Boys from all three schools were equally successful in obtaining jobs related to their training. Although no significant relationship existed between class rank in school and rank on the job, the poorest fourth of graduates had significantly poorer evaluations on every measure of job success. RE: Contract No. 81-22-30

Sir:

Reported herein are the results of a study initiated and conducted by Howard E. Bergstrom, Project Coordinator with the Educational Research and Development Council. Data were collected from August 1964 through May 1965, and the analysis and follow-up study were completed under contract with OMAT since June 1, 1965.

The purpose of the study has been to explore ways of using the work environment to appraise the effects of pre-employment education--both general and vocational education--on subsequent success of performance in the world of work. The field of the study would more accurately be personnel psychology than vocational education, although these are interwoven and interdependent fields.

The careful reader of Dr. Bergstrom's report will find that some fundamental challenges have been made to certain widely-accepted beliefs. These challenges would require large-scale research and program development to determine their worth. What has been established in the present study, we believe, is that the challenges are shown to have grounds for presentation.

The more tangible outcome of the study is the development of some techniques for evaluating young workers which might reflect on the school curriculum. As is appropriate in a pilot study, these methods are not finished instruments but may be useful to other researchers in developing refined techniques in specific occupational fields.

The colored-page section of this report presents an overview in non-technical terms, followed by the detailed technical report on white pages. We present this study in the hope that it may make a contribution toward current thinking and toward additional studies with similar objectives.

Sincerely yours,

Van D. Mueller
Executive Secretary

ACKNOWLEDGMENTS

Research in human affairs is always a joint effort, even when one individual actually carries out a project. The following organizations and individuals must be specifically mentioned in connection with the study reported in this volume, at the risk of omitting some whose contributions were also very valuable.

Administrators and counselors in more than 15 schools and school districts provided information, with most data obtained from Roosevelt and Vocational senior high schools in the Minneapolis Public Schools, and from the Robbinsdale Senior High School, Robbinsdale, Minnesota. Counselors Michael Davies, Donald Hanson, and Douglas Hanson conducted the telephone interviews with the graduates.

One hundred and sixty-one employed former students who graduated from the named high schools in 1963 were interviewed; the cooperation of these young men is greatly appreciated.

Executive and supervisory personnel in 123 places of employment in Minneapolis and surrounding areas granted interviews and provided information.

Several members of the Graduate School faculty of the University of Minnesota, Professors Gordon M. A. Mork and Cyril J. Hoyt in particular, have been consulted on the design of the study and the writing of the report herein.

The Educational Research and Development Council, through its Board of Directors, Commissions, and staff, has been the primary sponsor of the research. Executive Secretary Van D. Mueller and Associate Executive Secretary Donald E. Davis have been especially helpful, and Linda Kabrick typed the entire report.

The Office of Manpower, Automation, and Training, U.S. Department of Labor, has supported the study since June 1, 1965.

The writer could not have completed the project without the cooperation of his wife, Jane C. Bergstrom, to whom this volume is gratefully dedicated.

Howard E. Bergstrom

Minneapolis, Minnesota
April, 1966

OVERVIEW OF THE PROJECT

The Overview of the Project, presented on the colored pages preceding the study proper, has been prepared to provide the reader with a setting from which to view the problem and procedure of the study. Some of the insights and findings gained by the investigator are included as they seemed to bear on comprehension of the problem. An attempt has been made to write this section in non-technical terms.

OVERVIEW OF THE PROJECT

Introductory Comments

The approach of this study may be of more significance than the findings. While the findings appear to have validity related to high school graduates who work after leaving grade 12 in the Minneapolis area, it is not known that the conclusions would apply to other metropolitan areas or to graduates of post-high school educational programs. Somewhat different findings would be expected especially if a similar study were to be conducted on graduates of post-high school programs involving rigorous technical training and selected students.

Therefore, the reader is invited to consider the approach of the study--to the development of a generalizable technique for defining the essential elements of job performance, to the evaluation of individuals on these essentials, and to the relationship of jobs to school background--as being the aspect which may have value in acquiring insights and in planning for further research.

Problem and Purpose

What is known about validating curriculum?

Research evidence makes it clear that success in college can be partially predicted from achievement records in high school. But success at another level of education is not the primary criterion on which one may validate school experience. Such a criterion may be helpful, but the ultimate application of schooling is "life."

Evidence that certain patterns of schooling or certain levels of academic achievement affect "life" is almost non-existent. It is not difficult to discover that people who go to college make more money, but then one must not fall into the trap of thinking that the money is always directly attributable to the education. Boys who eventually take over their fathers' businesses or get well-paying jobs working for relatives would usually have done so whether they attended college or not.

Furthermore, there is little evidence to show in most cases that the amount and type of education received is entirely necessary;

almost every job has successful practitioners who learned their skills on the job rather than in school, and in these instances schooling serves primarily as a screening and selecting process and only secondarily as a substitute for on-the-job training. (Jobs where initial proficiency is necessary to protect the health or welfare of people to whom services are rendered would not be subject to the foregoing generalization, and are usually not open to research on alternatives.)

Three areas in which schools have a legitimate concern are: outcomes involving occupations, success in social relationships and civic responsibilities, and the fulfillment of intellectual and artistic potential. Most of what is known about relationships between schooling and outcomes in the above areas is in the form of discoveries that high achievement in school has a positive relationship to whatever outcomes can be measured objectively. The degree or extent of this relationship is usually quite low, however, and in most cases cannot be established as a cause-effect relationship. "What makes people what they are" is such a complex phenomenon that education cannot be given credit in any specific manner.

What one studies vs. how well one does afterward

It may be concluded from numerous studies that students' chances of getting high grades in college are much better if they have gotten high grades in high school. But, no differences can be traced to or associated with the kinds of subjects taken.

Many colleges deny admission to those who haven't had a prescribed background in certain subjects, such as in mathematics or foreign languages. In a parallel way, many personnel departments in business and industry bar from employment those applicants who haven't taken prescribed vocational or technical courses. Research in colleges demonstrates that subject matter requirements for entrance to college bar as many superior students as inferior ones. It may be reasonable to assume that a similar situation exists in beginning levels of employment.

When an employer will look only at applicants with a specific background of training then he may find that the best of those who qualify do not have the potential of the best of those (who might also have applied) who do not have this training. The decision made is always a compromise between the employer's desire to get the best long-run employees and the need to cut down the costs of training new employees on the job. When trained workers are in plentiful supply it is logical to employ these first, if they have good training records.

For a number of reasons, personnel psychologists have never been able to obtain good results in testing relationships between training records and success on the job. The greatest difficulty is the "criterion problem"--nobody is sure what it is that should be included in "success." Next, even when criteria are decided on, they are so intertwined that a subjective rating by the supervisor is usually the best form of evaluation, and these give low reliabilities.

Complicating the matter still more is the difficulty of finding groups of workers, doing the same job under the same supervisor, which include enough workers to give a good statistical spread if they are ranked, and thereby be comparable to grades given to classrooms of students by teachers. Finally, the groups of co-workers tend to be quite similar in aptitudes and abilities because those who can't do the work get fired and those who are capable of a better job move up.

The job as a place to evaluate curriculum

Despite the difficulties in evaluating job performance, the attempt must continue to be made, because in no other way is it likely that school curriculum may be eventually tested and justified on an objective basis.

The job, as a major part of "life," must increasingly become a place where outcomes of education other than vocational skills are exercised. Intellectual and artistic fulfillment, and the meeting of social and civic responsibilities, are increasingly recognized as ends in themselves in the job environment. Owners and managers in business and industry recognize that the production of goods and the rendering of services for profit need not be their only concerns. Workers in each place of employment have legitimate rights to achieve some of their own life goals on the job, in addition to helping to achieve their employers' goals.

In the work-setting described above, one would not expect a worker to exhibit one set of values and behaviors on the job and a different set when away from the job. He can be a consistent organism, and education can attempt to prepare him to be consistent. Education toward effective communications and good human relations might then produce results observable in the work-setting.

Within this theoretical framework, it is reasonable to speculate that evaluation of behavior in the work setting can eventually help to evaluate the worker's school experience and achievement, not only in vocational education but in general education as well.

Only the job-setting provides the opportunity to evaluate the ultimate results of curriculum, since the home is generally out-of-bounds and "citizenship" is largely out-of-reach--of research. The job is a controlled situation. Most tasks are subject to measurement. Supervisors have the obligation to measure success, and they are increasingly becoming more highly trained and conversant with research techniques. It is not unreasonable to propose that in the forseeable future education will receive valuable guidance through studies which demonstrate both general and vocational outcomes in the work-setting.

Design and Procedures

The specific objectives of the study

The overall purpose of the study was to attempt to make a contribution toward evaluating the senior high school curriculum through testing relationships between measures of school achievement and aspects of graduates' satisfactoriness on their first full time jobs. Measures of school achievement used were those already accessible in any school. More specific objectives might be listed as follows:

a) A technique was to be developed for simplifying the definitions of jobs available to entry-workers in a metropolitan area. This involved asking supervisors to rank the importance of personal qualities, basic literacy, and "skills unique to the job" for each job studied. Employers also classified each job on how demanding it was of the workers' abilities.

b) The predictive potential of various measures of school achievement was to be tested, as these measures might relate to supervisors' rankings and ratings of the workers on the job-factors.

c) An attempt was to be made to discover whether or not the satisfactoriness of workers could be related to the pattern of subjects taken in school, or to the school attended, if other factors were equal.

The sources of data

Data used in the study came from three primary sources. First, each boy from the 1963 graduating roster who was seemingly eligible to be in the study was telephoned by a guidance counselor from his school and engaged in a structured interview. The place of work was recorded, along with the dates of starting and ending

specific jobs, the supervisor's name, and other items. Second, the investigator gathered from the official school records the class rank, grades in English and vocationally-oriented subjects, attendance record, and scores in intelligence and the Differential Aptitude Tests. Graduates were classified "vocationally-oriented" or "general" according to the pattern of courses taken. Third, the employers of 150 boys were interviewed personally by the investigator, at 123 places of employment.

The Subjects. The group of 150 boys which was studied was thought to represent a "type" which has not received much attention in research. They were not school dropouts; they did not go on to college or other post-high school training; they did manage to get and keep full time jobs. They tended to have average intelligence and aptitude test scores, below-average English grades, and a wide range of grades in vocationally-oriented courses. A necessary condition for interpreting the study was to demonstrate that, as groups, boys who work directly out of high school will have the same characteristics regardless of the school graduated from. This started as an assumption which was tested in the first stage of the study, and was found to be true for the three schools selected. The rationale of this finding is that even when the total graduating classes of schools are quite different in composition, these differences are erased when the dropouts, the unemployed, those in post-high school education, and those working through "connections" are removed.

The Schools. Three schools were selected, one from each of three major metropolitan types: urban vocational, urban comprehensive, and suburban comprehensive. Only one vocational high school was available in Minneapolis, and the comprehensive schools were selected because they had the largest enrollments in the area. The numbers of students who met all criteria were surprisingly small, so that no sampling of graduates within schools was necessary. The three schools, in a sense, were a sample of all schools, and 1963 was a sample of all graduating classes. Fifty-five of 291 qualified from the vocational school, 51 of 669 qualified from the urban comprehensive school, and, 44 of 758 qualified from the suburban comprehensive school (total classes included girls, who were not studied). Because the graduates by school groups were equal (no significant differences) in aptitude measures and attendance records, individuals were assigned standard scores in English, vocational, and total grade averages according to their standing in their own school-groups.

The Employers and Jobs. The 123 places of employment, with as many as four separate job-settings in some places, provided a cross-

section of jobs actually open to boys just out of high school. Personal visits were made to each place, and oral interviews were conducted with supervisors of the 150 subjects--often with both a company personnel director plus a supervisor. The personal interview was thought to be necessary because of the importance of a high return, the sensitiveness of the topic, and the great range of personalities with whom it was necessary to achieve rapport.

The Sequence of Procedures

a) The criteria for selection of subjects were applied to the members of the 1963 graduating classes of the three schools. The subjects, thus selected, were interviewed by telephone; 183 were interviewed and of these 161 were found to qualify on the selective criteria. Data were gathered from school records on these subjects.

b) Employers of the 161 subjects were contacted by letter and telephone, and 123 places of employment were visited, resulting in interviews which produced data for 150 subjects. The subjects were ranked and rated with comparable co-workers and the jobs were defined by "content" and "demandingness."

c) School achievement measures, attendance, and ranks assigned workers by their employers were converted to approximate standard scores--in one-digit form for convenience of computation and presentation. Classification by school program taken, and the job content and demandingness, were also reported in one-digit form.

d) Chi-square tests of the relationships between various combinations of elements of the three basic sets of variables were computed. The variables were: (1) potential predictors (school achievement, attendance, and program taken); (2) the criteria for relating school experience with work experience (job content and demandingness); and (3) the evaluations of graduates-now-working (rankings on satisfactoriness and ratings of satisfactory or unsatisfactory).

e) A group of 90 co-workers was compared to the 150 principal subjects. The purpose of this comparison was to discover if the principal subjects and co-workers were alike as groups. However, an unpredicted bias in selection of co-workers, by employers, made the usefulness of the comparison questionable. Another comparison made at the conclusion of the study was between the principal subjects who were most "carefully" recruited and selected compared to those most "carelessly" recruited and selected.

Findings and Interpretations

What kinds of jobs were available to the graduates?

The findings which follow provide an approximation of the range and frequency of jobs open to high school graduates without further training--at least in the Minneapolis area. Of the 150 boys studied intensively: 12 were in high-skill, white-collar jobs; 11 were in high-skill, blue-collar jobs; 10 were sales clerks or service station attendants; 36 were stock or shipping clerks; 12 were in driving or delivery jobs; 14 were semi-skilled machine operators; 16 were in assembly, fabrication, or inspection; 11 were custodians or hospital orderlies; 12 were in public accommodations such as food services; and, 16 were miscellaneous unskilled laborers.

What did employers value most in their employees?

All 150 jobs were "defined" by employers as fitting into one of four levels of "demandingness," and also were defined by indicating the order of importance (to each job) of three clusters of characteristics: (1) Communications Competency, (2) Personal Adequacy, and (3) Skills Unique to the Job. In 91 of the 150 instances, "Personal Adequacy" was valued most. "Communications Competency" was valued most in 42 cases, and "Skills Unique to the Job" were valued most in only 17 cases. Where "Personal Adequacy" ranked first, "Communications..." ranked second in 50 cases and "Skills..." ranked second in 41 cases. Perhaps the results are not surprising when one considers that only 23 of the 150 boys were in jobs rated as "high skill." However, it is clear that vocational training must continue to stress training in communications and personal characteristics along with skills.

Which boys got (and kept) which jobs?

Boys from all three schools were equally successful in obtaining jobs related to their training; however, since a greater proportion from the vocational school had training, more got related jobs. The demandingness level of jobs did not differ significantly by schools. Demandingness was clearly related to achievement, however, in that significant findings were obtained for class rank, English grades, and vocationally-oriented grades--attendance did not show a significant relationship in this context. It is also worthy of note that workers rated "Unsatisfactory" did not necessarily lose their jobs. From three to 12 months after starting their jobs, 42 out of 150 were rated as those the employer would "as soon not rehire," yet most of these had passed a probationary period and would not be dismissed.

What differences were associated with selection procedures?

When the 48 "carefully selected" workers were compared with the 43 "carelessly selected" workers, a few interesting results were noted. First, the "careless" hiring tended to be done by the owners themselves, while the "careful" hiring was usually done by employed managerial personnel. "Careful" selection was recorded as often for general graduates as for vocationally-oriented graduates, and as often for one school as the others. "A" students in vocational courses tended to be more "carefully selected," as they also tended to have the best jobs, but English grades and attendance record seemed to make no difference.

What seemed to predict success on the job?

The parallel between grades in school (ranks) and ranks on the job was not generally supported by the findings. Perhaps the groups of workers were too small and too well-placed according to ability for relationships to school achievement to occur. Or, perhaps the "school situation" in general is too different from the "work situation" for clear relationships to be present.

There were two exceptions to the general lack of significant relationships. The "D" students in vocationally-oriented courses, from both types of schools, got lower evaluations even though they were working among less competent co-workers. (This occurred only in the "Skills..." evaluation, and not in the others.) A much clearer finding, it should be noted, concerned the attendance record. The poorest fourth of the graduates in attendance (in general, those who were absent and/or tardy 50 to 100 times in three years) had significantly poorer evaluations on every measure of job success.

How may the study be useful as a "pilot approach"?

The method of defining jobs on a grid, with "demandingness" on one axis and "job content" on the other axis, may be useful if further refined. The advantages of generalizing these two components, instead of attempting to provide detailed definitions of thousands of jobs, are these:

a) Automation and rapid technological change necessitate adaptability of workers (perhaps each square on the grid can represent a "family" of jobs within which a worker could easily adapt because they are fairly equal in difficulty and emphasize the same characteristics, even though their titles and detailed descriptions might sound very different);

b) Follow-up studies show that as many as half of all trained workers do not get placed or retained in a job they were trained for (perhaps the more generalized definition, and a more generalized training, would provide for better utilization of training).

A number of other features of the study may have pilot utility, especially the method of obtaining evaluations from the employers.

An Invitation to the Reader

Readers with more than a casual interest in the topic of this study may wish to have their attention drawn to certain parts of the detailed report which will illuminate some of the concepts to which reference has been made in this Overview. A few of these special references are:

(1) The research on validating curriculum is reviewed in Chapter II.

(2) The "grid" for defining jobs is given as Figure 2. Explanatory text accompanies the figure.

(3) The complete design of the study is given in Chapter III. Figure 4 illustrates the test of the central hypothesis.

(4) A more thorough summary of interpretations appears as the last major section of Chapter IV. See all of Chapter IV for the complete findings.

CHAPTER I

INTRODUCTION

Purpose and Limitations of the Study

Purpose

The general problem on which the present study is focused is that of establishing better predictive relationships between high school experience and subsequent success in post-high school employment.[1]

Better means of prediction would be useful in strengthening curriculum and in improving vocational guidance in secondary schools. The format of some sections of the study may have applications to similar analyses of data on graduates of post-high school programs.

Limitations

The present study has been conducted for the purpose of exploring numerous interrelated facets of the problem of education and employment. The upper limit of expectation regarding outcomes was that certain contentions or hunches might either be shown to lack support in the findings or be reinforced to the level of hypotheses worthy of further testing.

Outline of the Problem

The problem in its broader context

Although the specific problem of the present study is restricted by several conditions, the broad context of the larger problem from which it stems may be outlined as a matter of interest and perspective.

The problem of finding relationships between educational background and subsequent employment presents an immense arena for research. The assumption which offers the greatest theoretical difficulty is the assumption that education, or vocational educa-

---

[1]References to related research and other literature are found primarily in Chapter II. References in other chapters are footnoted only when a notation is made to a unique source.

tion in particular, is a cause, and employment, or success in employment, is an effect. But research on a cause-effect relationship faces almost insurmountable difficulties, chiefly because the elements of vocational success are so diffuse and the factors which have made a person what he is--home, school, church, peer group, heredity, etc.--are also diffuse. Therefore, the present study focuses entirely on predictive relationships, not cause-effect relationships.

The focus of research has been the "criterion problem." Investigators have not arrived at agreements on what criterion or criteria should be used for evaluating performance adequacy on jobs. Supervisors' judgments have been used most commonly as the source of ratings or rankings of the total or overall satisfactoriness of workers. However, attempts at breaking the total into sub-factors have been based on conflicting premises and the results are inconclusive.

The problem in a more restricted context

The subjects of the present study all managed to obtain jobs, without help from relatives or from special federal programs for the unemployed. They graduated from high school without special inducements. Therefore, it is logical to suppose that dropouts and the unemployed, through special efforts in training and placement involving the new federal programs, will cause some young people with characteristics similar to those of the subjects of the study to be "displaced by" (placed instead of) people with possibly less aptitude and initiative.[1]

The problem of the study may be viewed as having three sequential parts. First is the matter of deciding on criteria of satisfactoriness in jobs and of school background which might evidence relationships. Second is the matter of devising a means of obtaining evaluations of work performance which can logically be tied to potential predictors in the school background. Third is the difficulty of making a case for actual predictive relationships between single factors, where relationships might be found, inasmuch as the causal relationships are extremely complex and not subject to analysis through existing means.

Figure 1 provides a partial illustration of the approach taken in the study in regard to establishing criteria of satis-

---

[1]Both groups "deserve" jobs equally. The question here is simply that one group may suffer because the attention is focused primarily on another group.

factoriness. It also illustrates the procedure by which the jobs were arbitrarily "defined." (The abbreviations in Figure 1 are spelled out and explained in the section on Definitions of Essential Terms which appears in the present chapter.)

The measurement problem

Many obstacles are in the way of precise or even approximate measurement of the factors which must be controlled if the relationships between school experience and vocational success are to become clear enough so that specific recommendations for curriculum or guidance may be justifiably made. No attempt has been made in the present study to actually overcome these obstacles other than to contrive some measuring devices which are here hopefully presented as being adequate to discern strong relationships, but which are not thought to be sophisticated enough to measure the extent of these relationships.

The chief obstacles to precise measurement are summarized below:

a) Research to date is not clear on what are the criteria of success, or satisfactoriness, of workers on the job. It is clear only that the criteria used in research are more or less

arbitrarily defined by each researcher, and that various criteria have assumed the dominant position at different times in the history of the research.

b) Even when the criteria for judging satisfactoriness have been arbitrarily established, the problem of measurement is extremely difficult. Super concludes that the subjective evaluations by supervisors, despite their low statistical reliabilities, are the most defensible source of evaluations.[1]

c) In the schools, the foremost obstacle to the measurement problem is the uncertainty about which courses or subjects result in which outcomes. If the view is taken that any particular outcome is likely to be the product of experiences in more than one course, plus out of school experience, then the matter of deciding on curriculum change is indeed difficult.

d) Also a serious problem for education is the determination of what school "achievement" is and how it can be measured. Ideally, achievement should probably be equated with learning, and be most validly measured as outcomes in out-of-school and post-school life, by ascertaining what transfers of learning or behavior changes had taken place. The measures of achievement used in this study consisted of averages of letter grades assigned in sequences of courses, plus the record of attendance in grades 10 through 12. This led to the problem of developing a general standard for equating letter grade averages from school to school when the meaning of a specific grade varies from school to school.

e) Even if all of the foregoing difficulties could be overcome, there would remain the question of whether the success an individual might achieve on a particular job is success on the level of job which represents an optimum challenge to the individual, representing productivity commensurate with his capacity.[2] This difficulty level or "demandingness" of the job represents another dimension which must be measured and taken into account in comparing school achievement with success or satisfactoriness of workers on the job.

---

[1]Super, Donald E. "The Criteria of Vocational Success." Occupations, 30: 5-9; October 1951.

[2]The concept of "job difficulty level" will be termed "demandingness" in the remainder of the study, meaning how demanding the job is of the person's abilities, roughly quantified by a classification hierarchy of four levels.

Evaluating the effectiveness of local school programs

The primary or general problems outlined above are supplemented by others, which, if studied through analysis of local data, can have mainly local significance. Certain questions point up the possibility of problems with local applications. For example, are too many boys of low potential for filling "more-demanding" jobs nevertheless obtaining these jobs because they happened to receive certain training programs--and are they then failing to meet the demands of these jobs? Or, don't they get these jobs? If not, do they succeed as well on the jobs they do get as they would have if they had received more general education in place of vocationally-oriented education?

Background Dimensions

A concept of curriculum

A general concept of curriculum was arbitrarily adopted for the theoretical basis of the present study. This concept includes the point of view that the objectives of almost all curricula of public secondary schools can be logically categorized into: (1) preparing young people for the world of work; (b) helping individuals reach intellectual and artistic fulfillment through the liberal arts and sciences; and (c) providing experiences designed to help young people meet home and civic responsibilities.

Typically, a school subject or course is perceived as having one of the foregoing curriculum goals as its prime target. The contention held in the present context, however, is that only through a case study approach might one hope to determine the actual outcomes of any particular subject or course as it may have influenced a number of individuals who were involved as students.

That is, a case can be made for saying that English or biology can apply as readily, though perhaps not as frequently, to young people's occupations or citizenship as to their intellectual fulfillment. Or, social studies or homemaking can apply as readily, though perhaps not as frequently, to work or to intellectual fulfillment as to home and civic responsibilities. Or, bookkeeping or auto mechanics can apply as readily, though perhaps not as frequently, to meeting citizenship responsibilities or to developing intellectually as to preparing for the world of work.

To summarize: the definition of curriculum adopted as a base for the present study centers on the idea that the outcomes of most courses scatter widely, and that to trace and measure these outcomes

would be exceedingly difficult. However, if the performance of students, in subjects or courses which are logically connected to areas of performance in jobs, is taken to be a predictor of success in these areas and not necessarily the source or cause of success, then a reasonable basis for discovering meaningful relationships has been established.

Vocational education and "vocationally-oriented" courses

Of the three goals of public secondary education arbitrarily defined above, only preparation for the world of work was used as an area of evaluation in this study. Furthermore, the evaluations consisted of employers' subjective rankings and statements only. The context of study was therefore limited.

A background statement on vocational education and "vocationally-oriented" courses is offered as part of a rationale for defining arbitrary criteria on which the job-success evaluations were made. The assumption is that most courses in a senior high school program of vocational education (as defined by qualifying for support under the "Smith-Hughes" program, for example) do not differ significantly, especially in terms of observable outcomes, from courses in a general education program which are "vocationally-oriented."

That is, a course in either bookkeeping or auto mechanics, at the high school level, will have basically the same observable outcomes whether it is specifically a vocational course or a "vocationally-oriented" course in a general education program. Theoretically, a vocational course will include learnings which can be applied immediately to performance of paid work, while a general education course with the same name can be "pre-vocational," emphasizing basic or broad skills. In fact, however, there is a wide overlap, with many vocational courses providing instruction with antiquated methods or machines and many "non-vocational" courses employing the latest in methods and machines. This, at least, is the assumption. It was partially tested in the course of the study.

The objectives of either vocational courses or "vocationally-oriented" courses are not limited to specific skills and technical knowledge. Personal characteristics are developed in these courses, as are competencies in the basic academic skills, particularly in ways which apply to the total performance of a job; for example, communications skills learned in a shop course might better apply to the performance of a job than might the parallel skills learned in an English course.

No further differentiation between "vocational" education and "vocationally-oriented" education has been made in this manuscript. The assumption is that "vocationally-oriented" covers both concepts.

Trends in criteria of job-success

Until the 1930's and 1940's, the most common criterion of job-success was output. If a worker received fixed wages or salary, the employer was interested chiefly in receiving output worth more than the wages plus materials and overhead costs, so that a profit would result. If the worker received piecework remuneration, the employer was also interested in output so that a minimum number of working stations (space, tools, etc.) would be needed to achieve the volume of production desired.

The development of automated and semi-automated means of production has placed the emphasis of control of output on the machine rather than on the man. Especially in production jobs requiring little skill, either the worker keeps up with the machine, and nothing more is desired or possible, or he doesn't keep up, whereupon he cannot perform the job satisfactorily. In jobs which are still dependent on the speed of hand operations, most involve union contract regulations or informal agreements concerning the quantity of output. Output remains as an important factor in clerical, managerial, professional, and some service occupations, few of which are involved in the present study.

Output was not used as a success (satisfactoriness) criterion in this study because of its de-emphasis as a job-success criterion--so that it figures prominently in only a minority of cases among unskilled and semi-skilled jobs. Instead, "Communications Competency," "Personal Adequacy," and "Skills Unique to the Job" were adopted as sub-criteria of "Overall Satisfactoriness." Length of tenure was not a criterion because the tenure at the time of the evaluation was 90 days, by definition. Wages were not considered, and promotions were not used because of their low incidence in a three-month period.

Trends in supervisory relationships

The relationship between the worker and his supervisor has also changed greatly. The age of the sweatshop produced the foreman or supervisor whose leadership was frequently expressed in harsh or even abusive terms. The change in behavior of the typical supervisor has been drastic, as a result of the union movement along with the growth of enlightened human relations attitudes of management. Other influences for change have been labor shortages, during World War II and at other times, as well as basic research in the industrial relations field.

It is a general hypothesis of this study that the prevailing relationship between supervisors and young workers recently out of high school is enough similar to the relationship between senior high school students and their teachers so that this similarity will be reflected in tests of significance of the relationship between letter grades assigned in high school courses and ranks or ratings assigned subsequently by job supervisors.

Definitions of Essential Terms and Concepts

Comprehension of the analysis and interpretations in the present manuscript will be aided by definitions of terms and concepts which may be used in special or arbitrary ways in this study. Some of these definitions are included in the foregoing section, "Background Dimensions." Others are provided more briefly, below:

Entry jobs. These are defined as the jobs actually obtained as first full time jobs by the principal subjects of the study, and held for more than 90 days. These roughly approximate the range and distribution of entry-jobs such as those compiled by the U.S. Bureau of Manpower Utilization,[1] but no attempt was made to structure the classifications except in terms of the common-sense categories noted in Table 1. Table 2 is based on the 1960 U.S. Census.

The principal subjects. The principal subjects are defined as all male graduates of the 1963 classes of the three selected high schools who met the criteria which were set up to make the groups sufficiently similar for comparative purposes. The "principal subjects" are thus distinguished from the "comparable co-workers" who were also evaluated by the job supervisors.

"Job-situation." The unit of evaluation was the "job-situation." This was not the place of employment but rather referred to the group of comparable co-workers under the same supervisor who were doing approximately the same work. Some places of employment had two or more job-situations in the study.

TABLE 1

JOBS IN THE STUDY ACCORDING TO TEN ARBITRARY CLASSIFICATIONS

Job Classification	Number	Percent of Total
High skill, white collar (drafting, layout, etc.)	12	8.0
High skill, blue collar (mechanic, repair man, etc.)	11	7.3
Sales clerk (incl. service station attendant)	10	6.7
Stock clerk--shipping, receiving shelving, etc.	36	24.0
Driving, delivery (some in combination with clerical and janitorial)	12	8.0
Machine operator	14	9.3
Assembly, fabrication, inspection	16	10.7
Janitorial, custodial, hospital orderly, etc.	11	7.3
Food service and related public accommodations	12	8.0
Physical labor (unclassified)	16	10.7
TOTAL	150	100.0

TABLE 2

NATIONAL EMPLOYMENT BY OCCUPATIONAL GROUPS--1960[1]

Occupational Group	Number (millions)	Percent of Total
Professional, technical and kindred workers	7.5	11.2
Managers, officials, and proprietors (except farm)	7.1	10.6
Clerical and kindred workers	9.8	14.7
Sales workers	4.4	6.6
Craftsmen, foremen, and kindred workers	8.6	12.8
Operatives and kindred workers	12.0	18.0
Service workers	8.3	12.5
Laborers, except farm and mine	3.7	5.5
Farmers, farm managers, farm laborers and foremen	5.4	8.1
TOTAL	66.7	100.0

[1] U.S. Department of Labor, Manpower Report of the President and A Report on Manpower Requirements, Resources, Utilization, and Training. Washington: U.S. Government Printing Office, 1963. Abridged from Table 28, p. 100.

"Comparable co-workers." The workers who did about the same work as the principal subjects did in each job situation were called "comparable co-workers." They were considered to be comparable if they were high school graduates without further pre-evaluation training, if they met the other criteria set up for selection of the principal subjects, and if they were evaluated at the end of the normal probationary period for the job in question. In the initial analysis the statements of the supervisor or personnel officer were considered to be adequate evidence of whether or not each co-worker was "comparable."[1]

"Content" of jobs. Three areas of job performance were selected as criterion factors for the supervisors to evaluate, on the assumption that each is a factor in the performance of almost every job and that together they "cover" the bulk of performance on most jobs. These content or performance factors are "communications competency," "personal adequacy," and "skills unique to the job." The content of each job was indicated by the ranking in importance of the three content factors--by the employer or supervisor.

"Demandingness" of jobs. Together with the ranking in importance of the job-content factors, "demandingness" completes the system of job definitions as used in this study. Four levels of demandingness, or difficulty of performance of jobs, were arbitrarily defined.

Satisfactoriness. The meaning of "satisfactoriness" of employees was limited to the evaluations made by the immediate supervisor of each subject on his first full time job. In this context, "success on the job" included only the "satisfactoriness" of the employee--not other aspects of work-adjustment such as satisfaction of the worker.[2]

---

[1]After the completion of the main body of the study, a validation check was made on a sample of "comparable co-workers," in which they were compared to the "principal subjects" on attendance, I.Q., and the Differential Aptitude Tests.

[2]Heron, Alistair. "Satisfaction and Satisfactoriness: Complementary Aspects of Occupational Adjustment." Occupational Psychology, 28: 740-53; July 1954.

Communications Competency. One of the three job-content factors in the job definition as used in the study was "communications competency." The operational definition presented to employers included: "Reading instructions and following them;" "Writing records, reports, receipts, etc.;" "Following instructions given orally;" "Talking with co-workers or customers as a necessary part of the job;" "Recording and using numbers (here considered to be a part of language or communication) as in making change, taking measurements, etc." (The phrase "basic literacy" might have been used instead of "communications competency.")

Personal Adequacy. The second of three job-content factors in the job definition was "personal adequacy." The operational definition presented to employers included: "Gets to work on time, hardly ever absent;" "Works to the best of his ability;" "Honest, and is loyal to his employer;" "Gets along well with other workers."

Skills Unique to the Job. The third job-content factor arbitrarily defined for the study was "skills unique to the job" (each job). The sub-headings presented to employers included: "Things everyone has to know how to do to hold this job;" "Operations or skills the worker has to learn either in school (vocational training) or otherwise time has to be spent to teach him on the job."

"General" high school graduates. Subjects were classified as graduating from either "general" or "vocationally-oriented" high school programs. Boys who had, in grades 10-12, one hour a day or less of "vocationally-oriented" courses (such as industrial arts, bookkeeping or distributive training) were considered to be "general" graduates (exceptions are noted in Chapter III). For example, the introductory year in any industrial arts field was considered to be a part of general education, unless the student had taken the second year in the same field.

"Vocationally-oriented" high school graduates. The graduates of comprehensive schools were classified as "vocationally-oriented" if they had completed eight or more semesters of courses in industrial arts, business education, or other fields where the counselor affirmed that job preparation was the foremost objective. A few graduates were classified as "vocationally-oriented" if they had taken only six or seven semesters of vocationally-oriented courses when this amount included the full offering in one specific field, such as four semesters of auto mechanics or four to six semesters of printing. Since all graduates of the urban vocational high school had 10 to 12 semesters in one vocational field, they were all in the "vocationally-oriented" classification.

School achievement. The measures of school achievement analyzed in this study were: (a) class rank in grade 12; (b) average of letter grades in six semesters of required English; (c) average of grades in vocationally-oriented courses. Attendance (d) was also analyzed, as a type of performance related to achievement.

"Sten" scores. All measures of achievement and other characteristics analyzed in this study which could be assumed to be normally distributed in the population were converted to approximations of standardized scores which could be handled conveniently in one-digit form. The "sten" formula ("standardized scores in tens") was employed to assign percentages of the totals in the distributions of values which could logically be assumed to be normally distributed.[1] The "sten" formula is similar to the more common "stanine" formula. The "sten" percentages are: 2%, 5%, 9%, 15%, 19% (median) 19%, 15%, 9%, 5%, 2%.[2]

Outline of Objectives of the Study

The present study was essentially a pilot study, designed to explore some techniques for defining jobs and evaluating young workers, to test the predictive relationships between school achievement and subsequent success in employment, and to reinforce or show lack of support for certain hypotheses which will require further testing.

Objectives which may have general applications

a) A technique was explored for simplifying the definitions of jobs available to entry-workers in a metropolitan area--which

---

[1] Lyman, Howard B. Test Scores and What They Mean. Englewood Cliffs: Prentice-Hall, 1963, pp. 94-95.

[2] The extremes of this ten-point distribution were grouped in calculations of chi-square tests, in order to permit adequate frequencies to occur in all cells. As a result, a six-point scale actually was used, with values 1 and 2 grouped with 3, and with values 9 and 10 grouped with 8. (This was further reduced to a four-point scale in the case of the satisfactoriness ranks.) All, however, employ 5.5 as the median, with values of 3, 4, and 5 below the median, and with values of 6, 7, and 8 above the median.

included classifying all jobs into priority orders of three content or performance designations, plus classification into four levels of how demanding the jobs are of a worker's abilities.

b) The job-content areas were tried out as criteria for evaluating the job-success of young workers, through rankings of clusters of co-workers by their supervisors and testing for significant relationships.

c) The predictive potential of various measures of school achievement was tested, in a limited context, as these measures related to the evaluations of job-success or satisfactoriness.

d) Hypotheses for further testing were formulated, based on findings which resulted from the defined tests of relationships.

Objectives which have mainly local applications

a) An attempt was made to determine whether or not graduates who differ in school programs taken, but not in achievement, can be distinguished from each other, as groups, on the satisfactoriness rankings or ratings or on the content or demandingness definitions of jobs obtained.

b) The relationships among various descriptive data were explored (including data obtained from interviewing the graduates plus their employers).

Overview of Procedures of the Study

The procedures which were conducted in seeking the foregoing objectives may be outlined as follows:

a) Criteria for selection of subjects were applied to the members of the 1963 graduating classes of three high schools.[1]

b) The principal subjects of the study, thus selected, were interviewed by telephone;[2] 183 were interviewed, and, of these 161 were found to qualify on all selective criteria.

---

[1]Criteria for selection of subjects plus descriptions of the three schools are given in Chapter III.

[2]A copy of the interview form appears in Appendix B.

c) Data were gathered from school records, which included the measures of achievement and attendance, an intelligence quotient, scores from a differential aptitude battery, and a listing of vocationally-oriented courses taken.

d) Employers of the 161 qualified subjects were contacted by letter and telephone, and the 123 places of employment were visited, resulting in interviews which produced complete data for 150 subjects. In the interviews, the subjects were ranked and rated with comparable co-workers and the jobs were defined by content and demandingness.[1]

e) School achievement measures, attendance, and ranks assigned workers by their employers were converted to approximate standard scores--in one-digit form for convenience of computation and presentation. Classification by school program taken, and the job content and demandingness, were also reported in one-digit form.

f) Chi-square tests of the relationships between elements of the three basic sets of variables were computed. The variables were: (1) potential predictors (school achievement, attendance, and program taken); (2) the criteria for relating school experience with work experience (job content and demandingness); and (3) the evaluations of graduates-now-working (rankings on satisfactoriness and ratings of satisfactory or unsatisfactory).

g) Tests were made to determine whether or not the recruitment and selection practices of employers might be reflected in various ways.

h) A group of 90 co-workers was compared to the 150 principal subjects on aptitude scores and attendance. The purpose of this comparison was to discover if the principal subjects and co-workers were alike, as groups. (An unpredicted bias in selection of co-workers, by employers, made interpretation of this comparison questionable.)

---

[1]Copies of the material sent to employers plus the interview form and the ranking cards appear in Appendix B. A listing of places of employment where interviews were completed appears in Appendix C.

CHAPTER II

REVIEW OF LITERATURE

Introduction to Chapter II

The research literature relevant to the present study was reviewed in association with three research topics, and, in addition, literature on the broader problem surrounding the study was surveyed in part. Because an exhaustive review of literature on all four topics would have been prohibitive, an attempt was made for each of the research topics (1) to identify one or two published bibliographical reviews which are recognized as authoritative, with special note made of synthesizing or concluding statements, and (2) to supplement the bibliographical reviews with special references to specific studies which tie in directly to the present study.

The four topics on which the review of literature was organized appear below.

a) Prediction of college success

b) Prediction of vocational success

c) School curriculum and job performance

d) Literature on the broader problem

Prediction of College Success

Prediction from course achievement

It is well-established in research literature that the best predictor of overall college success (grade average) is the high school grade average or class rank. Travers, in one bibliographical summary, stated that "... the evidence indicates that the best single measure for the selection of the college sutdent is his average grade in high school. Study after study has indicated that the average high school grade is a better predictor of college grades than either subject matter or psychological tests."[1]

---

[1]Travers, Robert M. W. "Significant Research on the Prediction of Academic Success." In Donahue, Wilma T., et al., (eds.) The Measurement of Student Adjustment and Achievement. Ann Arbor: University of Michigan, 1949, p. 154.

Garrett arrived at the same conclusion in another summary in which he noted in addition that the correlations between high school and college grades are relatively good (.50, more or less) when the students studied are from several high schools in attendance at several colleges. The correlations improve when studies follow graduates of one high school to several colleges, and they improve still more if only one high school and one college are involved.[1]

A more recent study may be noted as an indication that the pattern which had been documented thoroughly up to 1950 is still valid. In 1963, Giusti reported a typical pattern. 397 freshmen were traced back to their high school records, and grade averages were compared between high school and college, on the total average and on the averages by subject fields. The product-moment correlation between the totals was .477, with the .01 level of confidence for significance at r± .148. None of the subject averages predicted total college average as well as did the total high school average, although subject averages had higher correlations with the same subject in college.[2]

Garrett also compared the merits of using total grade average or class percentile rank. Reference was made to 12 studies and a conclusion was cited that the difference favored the grade average but was too small to be of consequence.[3] (Class percentile rank was used in the study reported in the present volume because it was the most accessible. Also, if grade averages had been used, the change to "stens" would have erased any difference.)

Prediction from pattern of courses

Other studies are cited in the review by Travers which pertain to predicting college success from the patterns of courses, or the emphases of curriculum. Many colleges require that entrants must

[3]Garrett, op. cit., p. 96.

have taken a certain number of credits in certain subject-matter areas. Travers refers to seven studies which show that " ... there is practically no relation between pattern of high school credits and success in college."[1] One study by Douglas reported that when colleges impose credit minimums in particular subjects they bar as many superior students as inferior ones.[2]

Relationship to the present study

The prediction of college success from high school achievement is held to have some parallel features to prediction of success (ranked satisfactoriness) in employment from high school achievement. If parallel features in a study are valid as predictor constructs, and if the methods and instruments are adequate, it might be supposed that school achievement would tend to predict satisfactoriness in employment.

The prediction of college success from patterns of emphases of curriculum has not been reported in the research literature. Likewise, a study of whether or not a substantial number of vocationally-oriented courses taken will be likely to affect satisfactoriness in employment would not be expected to result in the finding of significant differences.

Prediction of Vocational Success

Difficulty of establishing "success" criteria

Just as college "success" may be determined only in part by college grades, vocational "success" may be appraised only in part by the parallel of college grades in employment--ranks in satisfactoriness which are assigned by supervisors. Bell and others describe the problem as follows:

> "One of the most perplexing problems in applying... (measurements to personnel settings) is that of measuring job success. Few jobs are sufficiently oriented toward individual production to permit quantitative measurement. Rate of pay also presents problems in

---

[1] Travers, op. cit., p. 159.

[2] Douglas, H. R. "Selecting College Entrants." Journal of Higher Education, 3: 179-184; April 1932.

that, often, it is not directly associated with the aptitudes required for successful performance in the basic job... As a result, most successful researchers have abandoned such measures in favor of some form of rating scale (completed by the worker's immediate supervisor) to estimate differing degrees of job competence."[1]

Super has summarized the history of criteria used in research on vocational success. He also concludes that rating forms filled out by supervisors constitute the most sound approach, in that job-success is a complex outcome with no convenient objective measure similar to grade average in college.[2] Relatively low reliabilities of these ratings, however, place a ceiling on the development of validity through subjective means.

Low reliability of ratings is not simply a matter of the raters' judgments being understandably approximate. Vagueness of criteria can range from the differences in raters' concepts of "Below Average" or "Above Average" to differences in interpretation of highly specific factors.[3]

Success has two major dimensions

A matter of social importance is that the worker's satisfaction with the job also has a large role in determining job "success." The orientation of research until after World War II had been largely based on production output or how well the worker pleased his employer. But a growing awareness had come about, to the effect that workers have certain rights in employment, to security and self-realization, and that employers are not autonomous in their ownership of property and means to production but are subject to certain controls from society as a whole.

This awareness is evidenced in the division of current research between "satisfaction" studies and "satisfactoriness"

[3]Super, Donald E., and Crites, John O. Appraising Vocational Fitness (rev. ed.). New York: Harper and Bros., 1962, pp. 32-41.

studies. Scott and others[1] have developed a definition which makes "work adjustment" the most inclusive term, with "job adjustment" as a phase of work adjustment focused on one job. Within either work adjustment or job adjustment are the two dimensions of success: "satisfaction" (of the worker) and "satisfactoriness" (to the employer).

Heron has been cited as a prime contributor in placing the satisfaction-satisfactoriness dimensions in perspective for research. He outlined this theory in connection with a study of bus conductors in which he attempted to reduce evidence of satisfactoriness to objective criteria, thus placing workers into gradations of satisfactoriness before presenting these placements to supervisors for subjective confirmation or disagreement.[2]

Within the dimension of satisfactoriness are sub-dimensions or criteria which can be abstractly dissected in several ways. Ghiselli has offered one analysis which identifies "static," "dynamic," and "individual" criterion-dimensions.[3] In the case of the effectiveness of a retail salesman, for example, a static dimension might be simply the volume of sales. A dynamic dimension might be illustrated by a young salesman selling mainly on energy and enthusiasm, but as he grows older he sells more with less work but more poise and skill and he has built up a clientele. The individual dimension is illustrated by a situation where a group of beginning workers are equally satisfactory but for different reasons: one secretary is a faster typist, but another is more accurate, etc.

Satisfaction and satisfactoriness are psychologically inseparable, in the worker, and each undoubtedly has an effect on the other in research findings, although means are not available to discern the interrelations. Means of evaluating both dimensions simultaneously were not found in the literature.

Satisfactoriness as a complex criterion

Ghiselli has criticized researchers for either assuming a simple criterion for evaluating satisfactoriness or giving equal

[3]Ghiselli, Edwin E. "Dimensional Problems of Criteria," Journal of Applied Psychology, 40: 1-4; February 1956.

weight to each of several criteria.[1] Balma has made a similar statement in the form of stating the problem and in encouraging research in the direction of "synthetic validity." Balma illustrates the validity problem as follows:[2]

a) There are too few people on any one job to conduct traditional validation studies in the great majority of job situations.

b) Results are needed immediately and conditions change, making follow-up studies impracticable in most cases.

c) Learning takes place on the job and makes most results inapplicable to individuals.

d) There is a great variability in the content of jobs with the same title.

e) There is a constant change in the content of the <u>same</u> jobs.

f) The rate of introduction of new jobs is too rapid for most research to apply.

One more point might have been added, from Ghiselli's presentation: that workers on the "same" job in different companies vary widely because of recruiting and hiring differences, and therefore cannot be grouped in studies without controlling the differences.

Apparently, Ghiselli and Balma are calling for development of methods which are not dependent on stereotyped job content and defined performance elements which "cover" the job in question. The study reported in this volume was an attempt, in pilot fashion, to leave flexibility in the job content dimension and still provide for a limited and manageable number of choices. In particular, an attempt was made to devise a format of analysis to fit most jobs held by entry workers.

The approach taken in the series of recent studies by the Industrial Relations Center staff at the University of Minnesota is that "Satisfactoriness has more direct reference to the standardized set of work behaviors required of the employee than to the contribution of the employee toward the attainment of the

---

[1]Ghiselli, <u>op. cit.</u>

[2]Balma, Michael J. "The Concept of Synthetic Validity," <u>Personnel Psychology</u>, 12: 395-96; Autumn 1959.

employing organization's goals. Systematic methods of measuring the individual's contribution toward the attainment of the employer's goals have not as yet been developed."[1] A comprehensive review of the literature on the behavioral criteria relating to the "sets of work behaviors" has been published in another volume of the series of studies by the Industrial Relations Center.[2] Among the more than 50 studies noted in this review, findings were reported to the effect that: (1) no findings relate employee attitudes to performance on the job;[3] (2) performance has shown little relation to psychological measures of individual differences; (3) when using multiple criteria a major problem is criterion-reliability; (4) data obtained from personnel records in industry, especially when attempting to combine data from several companies, tend to correlate with data directly from workers at unsatisfactorily low levels.

A brief discussion of the literature on criteria of job success has been given by Super.[4] Thorndike and others are cited in reference to the conception of immediate, intermediate, and ultimate criteria. In the study reported in this volume, the ranking and rating of beginning workers in entry jobs should be considered as applying to criteria having some intermediate as well as ultimate characteristics, even though the intermediate designation usually is given to performance associated with a trial period. Immediate criteria would be the success in training, in this case the school achievement.

Status of theory concerning criteria

Researchers seeking objective and highly reliable situations in which to conduct research on job performance (such as those studied by Heron, Rothe, etc.) will find that few jobs lend themselves to this approach and these are rapidly giving way to automation. Therefore, the studies which have the clearest designs and outcomes are rarely applicable to practical situations.

[3]Brayfield, A. H., and Crockett, W. H. "Employee Attitudes and Employee Performance," Psychological Bulletin, 52: 396-424; September 1955. An observation made was that, theoretically, attitudes need not be related to performance unless more intrinsic goals of the worker are achieved through high performance.

[4]Super, Appraising Vocational Fitness, op. cit., pp. 31-41.

Personnel research in the military services emphasizes supervisors' subjective evaluations, because behavior in a disciplined inter-personal situation is the ultimate criterion rather than objective output. But in other ways the research conditions are superior to civilian situations, because of the direct relationships and single administration over both the training and performance situations, and the highly-defined assignments and relatively uniform background of supervisors. In spite of these advantages, however, Kipnis and Glickman have written that the U.S. Navy has not had much success in validating the predictors of the supervisors' evaluations. These predictors have usually been assumed to be the attrition and achievement levels in Navy technical training schools.[1] In comments on U.S. Navy personnel studies in general, Bechtoldt states about achievement grades, that "grades at their worst have been found to lack all the qualities of an acceptable criterion. Even in the best schools, grades lack one or more of these (the essential) qualities."[2] Tests are described as being more useful but still inadequate except for screening out the poorest risks.

With the job situations where an objective criterion may be applied becoming rare, and research on subjective criteria unsatisfactory even in the most controlled interpersonal situations (military), it is not surprising that the two widely divergent positions given below can be found in recent literature.

Guion has written "... the solution to the criterion problem does not lie in the typical efforts at statistical refinement. Much of this has been blind numerical manipulation." He continues to say that the search for an ultimate criterion (general satisfactoriness) is futile, and what must be done is to seek and use criteria which exist along many dimensions.[3]

Super, on the other hand, has stated, in conclusion to a review of several studies, "... apparently, no matter what the

supervisor is asked to rate, no matter how specific the behavior he is asked to judge, he rates on the basis of a general evaluation of the person as a worker and as a person. In fact, it would hardly be an exaggeration to say that he rates the worker more as a person than a worker."[1]

Studies with direct relationships

Five studies reported in the literature have certain specific relationships to the study reported in the present volume. Kipnis and Glickman used eight traits of Navy enlisted men as criterion-measures, plus overall job effectiveness.[2] Two of the traits pertained to ability to maintain and operate equipment (similar to "Skills Unique to the Job" in the present study). The remainder pertained to a variety of personal qualities ("Personal Adequacy" was used in the present study to refer to a cluster of traits). The results showed a high overlap among some scales, and the best evidence of valid prediction occurred between tests of hand skills and the ratings on operating and maintaining equipment.

A study which was of considerable theoretical value in the design of the present study has been reported by Bell, Hoff, and Hoyt.[3] Three methods of rating were used in the study cited. Rating A was "job-oriented." The supervisor was first asked to list the tasks involved in a job which pertained to a specific cluster of workers. Then he rated each worker on each task. The result was ratings on different criteria. Rating B focused on behavior. Twenty-five pairs of positive and negative behavioral descriptions were checked (or not) by the supervisor. Rating C was a traditional trait-oriented scale, of ten traits. The predictor was the General Aptitude Test Battery. The results did not help much to make a case for the test battery, but the theoretical implications may be of considerable value. Ratings A and C had moderate positive correlations, and Rating B did not. The study reported in this volume has been an attempt to form a compromise between "job-oriented" and "trait-oriented" evaluations. Ranking the given traits provided some opportunity to reflect job-orientation.

[3] Bell, Hoff, and Hoyt, op. cit., pp. 416-418.

The study by Carlson, et al., provided ideas for the present study in the measurement of satisfactoriness through ranking.[1] Ranking of workers in clusters where all do similar work has an advantage over rating in that the evaluator is forced to state his preferences, where in rating the evaluator can place most or even all workers in one classification. The differences among evaluators is also controlled to the extent that some might rate most high and others might rate most low. Ranking does not, of course, control the factor of differences in the average quality, or range of quality, among the clusters of workers.

An analysis of worker functions by Fine was helpful to the investigator in formulating a rationale for the job content factors and in devising a system of factor weighting based on ranks.[2] Fine, of course, has provided a much more advanced and complex analysis than could be fully used in the design of a restricted and simple pilot study.

Also of value as background to the rationale were two related articles by Sluckin which analyze in depth the problems involved in combining or not combining criteria of occupational success.[3] These analyses were not used directly in development of the present study but are noted as sources for studies in which attempts might be made to evaluate sub-criteria with some precision.

Curriculum and Job Performance

Relevant studies at the entry-job level

Research on the comparative effects of widely differing curricular patterns on the performance of specific jobs appears to be almost non-existent. Brandon and Evans state that survey research on even the placement success from differing programs is

---

[3]Sluckin, W. "Combining Criteria of Occupational Success," Occupational Psychology, 30: Part I, pp. 20-26; January 1956. Part II, pp. 56-68; April 1956.

not plentiful (only one study cited), and "... data on success in the occupation are much less frequently available" (no study cited).[1]

The investigator found no studies where workers on the same job definition from two or more differing types of curricula were compared on performance factors, with adjustments made in the statistical analysis for possible differences in intelligence, aptitudes and other background factors which could affect success. If a parallel were to be drawn from the research on predicting college success from differing high school programs, the hypothesis supported by the parallel rationale would be that few differences would be found in job performance between groups from differing pre-employment curricula. The well-known Eight Year Study, for example, resulted in findings in regard to the higher aptitude students which favored the experimental groups with relatively small but significant differences, and with differences between the groups of students of lower aptitudes which were not significant.[2] (The study reported in the present volume pertains to students with as low mean aptitudes as those with the lower aptitudes in the Eight Year Study.)

Only certain jobs would be subject to research focused on the above hypothesis. Vocations for which licensing is required by law, for which specific curricula are prerequisite, are not subject to such research under existing conditions. Other occupations for which specific training programs are not mandatory but are customary would require large-scale cooperation between education and industry to set up adequate test situations. Thomas has analyzed occupations according to their relationships to formal schooling. He has called attention to the possibility that customary or required training programs may not be "... functionally related to competent performance in the occupations."[3]

Two doctoral dissertations may be noted which approach the area of research sought for. Andre found that differences between

---

general-academic and vocational-technical high school graduates in St. Louis were appreciable in regard to type of placement and other factors but that employers' ratings indicated no appreciable differences between job performance and work habits of the two groups.[1] Kjos, in a comparison of general high school graduates with some industrial arts courses and "day-trade" graduates with Smith-Hughes type of training, generally found slight differences favoring members of the day-trade group who were employed in industrial and skilled occupations in the Kansas City area. Employers rated day-trade graduates higher in more categories, but rated general graduates higher in leadership and in some technical aspects.[2]

Observations on evaluating curriculum

The studies on satisfactoriness noted earlier pertained almost exclusively to research completed by personnel psychologists focusing on military or industrial job performance--their emphases were on psychological tests as predictive criteria, and only rarely did curricular patterns in formal schooling or training enter the picture. Curriculum research by educators, on the other hand, almost never pertained to quality of performance in out-of-school life--of which competence in the world of work is the most accessible area. A search through the most likely reviews of research literature revealed almost no relevant studies, and even observations on needed research on post-school satisfactoriness were difficult to find. (Studies of "success" in the form of types of jobs obtained were not sought after.)

A few references to needed research (on curriculum evaluated through occupational outcomes) were found, but again these focused on the "criterion problem." Gagne has recommended that the direction of vocational change requires applications of principles of learning to analysis of the worker's role with an emphasis on knowledge and other more general competencies rather than the traditional analysis of "operations."[3]

[3] Gagne, Robert M. "Military Training and Principles of Learning," American Psychologist, 17: 82-91; February 1962.

In an issue of The Review of Educational Research, on guidance, counseling and personnel services, the only reference to possible evaluation of higher education through ascertaining success on the job was a single sentence, "To a great extent, education that has been content to organize its programs has failed to study systematically the outcome or products in order to determine the improvements needed."[1] In an article on the vocational development process, the only references to post-school outcomes pertained to job satisfaction, with none to satisfactoriness.[2] In another issue of the Review..., devoted to curriculum planning and development, the article entitled "Curriculum Research" contained the following statement concerning the ultimate criteria of curriculum evaluation, "... it may be reasonable to hold curriculum research at an observational stage until investigators concerned with research on teaching and learning find improved ways to understand and make predictions relevant to variables in these areas (pupil gain and growth)."[3]

Leighbody summarized evaluation in trade and industrial education with a statement including these comments: "Serious attempts to evaluate outcomes in trade and industrial education have been few. No standardized tests, such as exist for measuring academic learnings, can be found... To know how well the product of the trade and industrial program has fared in his industrial life would require careful follow-up studies conducted over a period of years. No such studies have been reported."[4] Wenrich has written on the topic of vocational education a conclusion less direct but with a similar implication: "Vocational education programs are subject to direct evaluation by those who employ the product and by fellow workers in the occupation." No studies are cited on this point.[5]

[5]Wenrich, Ralph C. "Vocational Education," Encyclopedia of Educational Research, (ed. by Harris, C. W.) Third Edition. New York: MacMillan Co., 1960, pp. 1562-1563.

A related article in the Encyclopedia of Educational Research entitled "Industrial Arts" contained no references whatever to post-high school evaluation, and, the article entitled "Secondary Education--Programs" included comments on five studies which involved post-school follow-up, but none of these pertained to job satisfactoriness.[1]

Theoretical observations from professional education

Determined efforts have been made to predict vocational satisfactoriness in several fields at the professional level of training, with some of the most thorough work reported for engineering education and teacher education. Even in these fields, however, studies are rarely made on comparisons of curricular patterns in regard to success on the job. Engineering studies emphasize placement success in relevant job definitions. Teacher education studies emphasize prediction of satisfactoriness from measures of aptitude, and less frequently, from measures of achievement.

The outstanding effort in the prediction of teacher satisfactoriness (effectiveness) is the 30-year series of studies by Barr and associates at the University of Wisconsin. Barr has written that "... the problem that needs clarification, possibly before all others, is that of the criterion of teacher effectiveness."[2] The three types of criteria used in the Barr studies have been (1) ratings of efficiency or effectiveness by superintendents and other supervisory personnel, (2) measures of pupil achievement, and (3) a pre-service criterion, from the preparatory experience in college. To solve the criterion problem, Barr stated, there is a need to develop "... An acceptable theory of the nature and structure of teaching ability... The prevailing theory is an elementalist factor theory... (in which) the elements are presumed to be additive. A hypothesis advanced...is that possibly the ingredients of effectiveness are not additive and an inadequacy in any one of a number of critical factors may make the teacher thoroughly unacceptable...

[2]Barr, A. S., and others. "Wisconsin Studies of the Measurement and Prediction of Teacher Effectiveness: A Summary of Investigations," Journal of Experimental Education, 30: 1-156; September 1961, p. 147.

notwithstanding... (the teacher's) abilities in other respects. The factors which are considered critical may vary from community to community."[1]

The "criterion problem" as outlined by Barr could be modified to fit almost any type of job. Entry jobs in business and industry, as well as many professional and semi-professional jobs in technical fields, may be more subject to analysis than the vastly subtle and complex concept of "teaching effectiveness." But the relationship between curriculum patterns and job satisfactoriness seemed, at the time the present study was undertaken, to be virtually unexplored.

Literature on the Broader Problem

The last of four major topics to be discussed in the review of literature pertains to information and background concerning the broad problem of education and jobs.

Employment and vocational education

Wolfbein has observed, regarding the problem of employment, that 26 million young people will enter the labor force during the 1965-75 decade, while the number of older workers who will leave is only a fraction of this volume. This fact must be assimilated along with the fact that productivity per worker has approximately tripled in the past 50 years; for example, in the production of automobiles 17 per cent fewer workers were required in 1963 to turn out the same number of automobiles as in 1955.[2]

The magnitude of the employment problem which will occur whenever the rising rate of consumption of goods fails to keep up with the rising rate of productivity per worker can only be speculated upon. The importance of the problem, however, justifies intensive research on all aspects. Rosen has summarized the basic need for teamwork between placement people in the employment service system

---

[1] Ibid., p. 147.

[2] Wolfbein, Seymour L. "Automation, Education, and Individual Liberty," Teachers College Record, 66: 27-32; October 1964.

and vocational educators, along with the need for accurate information on current and prospective employment both locally and nationally.[1]

The Office of Manpower, Automation, and Training has provided comprehensive annual reports on the status of employment and unemployment, along with projections of the needed economic growth commensurate with rates of expansion of the labor force and productivity factors by major industries and occupations. The educational levels needed for fulfillment of requirements for skills and knowledge have been outlined. Educational needs vary from formal school training in skills to on-the-job training to education for basic literacy.[2]

Vocational preparation in the broad curriculum

The sharp distinction between vocational preparation and general education which is characteristic of the educational systems of most European countries has not been as clearly drawn in the United States. Wherein European education tends to stress liberal studies almost exclusively until the time arrives to begin vocational or professional studies almost exclusively (earlier for vocational, later for professional), American education has usually found vocational preparation occupying a major place in the total curriculum.

Preparation for the world of work has been an integral part of such central statements of educational objectives as those issued by the National Education Association's Commission on Reorganization of Secondary Education and the Educational Policies Commission. The seven Cardinal Principles of Secondary Education included "vocational efficiency" as one major objective. Education for All American Youth (Educational Policies Commission, 1944) outlined four major objectives of education, including "fulfillment of economic needs." The remaining three objectives outlined were: "the development of the learner;" "the improvement of home, family, and community life;" and, "performance of civic and social duties."[3] (Combining the latter two objectives would cause the

---

foregoing list to approximate the three objectives used in the rationale of the present study.)

In introducing the Taxonomy of Educational Objectives, Bloom, et al., state that they conceive of three major parts to a complete taxonomy: the "cognitive domain," focusing on knowledge and intellectual abilities and skills; the "affective domain," concerning interests appreciation, attitudes, values, and adjustment; and, the "domain of manipulative or motor skills."[1]

Two approaches to classifying educational objectives are illustrated above. Both have been used in the rationale of the present study. "Preparation for the world of work" is the "area of living" through which an approach to the evaluation of curriculum has been developed. Within the "world of work" (the job-situation), all three of the "domains" of Bloom's taxonomy have been used in the evaluation of workers' satisfactoriness: the "cognitive domain" is represented by "Communications Competency;" the "affective domain" is represented by "Personal Adequacy;" and, the "domain of manipulative and motor skills" is represented by "Skills Unique to the Job." Of course, the validity of these representations vary from job to job, and only in a pilot study would the grouping of job types be an acceptable procedure.

Evaluation of the "affective domain"

The success of high school experiences in the "cognitive domain" can be partially tested against achievement in post-high school educational programs, and to some extent in out-of-school life through tests which might be administered. The success of teaching the "domain of manipulative and motor skills" can theoretically be measured in research situations which are roughly parallel to those associated with the "cognitive domain"--although relatively little of such research has been accomplished. However, the "affective domain"--the "domains" are from Bloom's taxonomy--is presently unexplored by research which might tend to support the affective objectives of school curriculum, and no parallel constructs, such as achievements which can be objectively measured as partial outcomes, are available.

---

[1]Bloom, Benjamin. Taxonomy of Educational Objectives: Part I, The Cognitive Domain. New York: Longmans, Green, 1956; pp. 3-4.

This relatively barren area of the research literature should someday be richer in important studies. The development of human beings in ways related to interests, appreciations, attitudes and values has long been a prime objective of education, but without means of evaluating outcomes, or even establishing clear relationships to presumed outcomes, the curriculum designed toward these ends is less easy to defend. The Hawthorne Plant studies reported by Rothlisberger and Dickson are perhaps the best-known early source of research on the importance of human relations factors in job performance.[1] Trends seem to indicate that the affective outcomes of education will become increasingly important to success in the world of work--or in most walks of life--in the future. The job, as an environment in which research on educational outcomes can be reasonably attempted, should and will be used for this purpose.

---

CHAPTER III

DESIGN AND PROCEDURES

PART ONE: PRELIMINARY CONSIDERATIONS

Introduction to Chapter III

The present chapter is divided into three major parts, to aid in organization of a large amount of detail. Part One reviews essential aspects of the introductory chapter and reports the rationale and tests used to validate the scoring of raw data. Part Two presents the detailed rationale for and the descriptions of the variables. Part Three features an outline of the tests of relationships which were conducted and the follow-up study for validation purposes.

The overall objective of the study was to attempt some contribution toward evaluating senior high school curriculum through ascertaining relationships with aspects of graduates' performance on their first full time jobs. This objective is not likely to be achieved except through the completion of numerous large-scale studies conducted over a period of years or even decades.

The possible contributions of the present study--entitled a "pilot approach"--was thought to be mainly in exploring the potential of certain techniques of evaluating job performance and in relating these measures of performance to selected measures of school achievement or behavior. The latter measures were selected because of their universal availability in school records, not because they are necessarily the measures most logically-connected to the job performance factors which were developed.

The preliminary major task was to devise and try out a technique of defining jobs--particularly entry jobs obtained by male high school graduates. The essentials of the technique which was devised were illustrated in Figure 1, and this figure is repeated in the present chapter as Figure 2.

The first purpose of the method was to make it possible to obtain the needed information in the time allotted to each interview. The second purpose was to scale the jobs by their difficulty of performance (termed "demandingness") so that this factor would be more or less controlled. The third purpose was to classify the jobs into six types according to "content," which was done by

having the employers rank the relative importance of three content factors common to almost all jobs.

The validity of the method of "defining" jobs can of course be questioned, since it involves the "criterion problem" which has plagued all who have attempted to obtain job performance evaluations. They validity of the job-defining could not be explored with satisfactory thoroughness in the context of a pilot study, and neither could the validity of the connections with the predictor measures be properly explored.

The subsequent major task of the study was to test for predictive relationships between measures of school experience and performance on-the-job. (The parallel predictive relationship is that which has been established between class rank in high school and the comparable relative standing of high school graduates in college-level academic rank.[1])

The general position which was examined in testing a wide variety of specific relationships may be stated as follows: Although relationships between school experience and satisfactoriness of performance on-the-job may be impossible to demonstrate as causes and effects, these relationships contain valid predictive potential. As relationships were found, in patterns which reinforced each other and supported meaningful interpretations, this predictive potential was tapped, at least in small part.

The variables tested for relationships

Six major variables were selected and tested for statistically significant relationships. These may be best considered as three sets, or pairs, as outlined below.

a) School experience factors

(1) School achievement, as measured by class rank, averages of letter grades in English and in vocationally-oriented subjects, and school attendance record

---

[1]Travers, op. cit., p. 154.

(2) School programs, with high school graduates classified according to the amount of vocationally-oriented course work taken (plus classification according to whether or not each has a job related to his training)

b) Job definitions

(1) Classification by job content, according to six arbitrary descriptions based on the priority orders of the performance-areas entitled "Communications Competency," "Personal Adequacy," and "Skills Unique to the Job"

(2) Level of "demandingness" of jobs, based on a hierarchy of difficulty of performing the operations involved

c) Evaluations of satisfactoriness

(1) Ranking of workers on each satisfactoriness criterion--"Communications Competency," "Personal Adequacy," "Skills Unique to the Job," and "Overall Satisfactoriness" (by the supervisor on each job)

(2) Rating of each worker[1] as "satisfactory" or "unsatisfactory" (by the supervisor on each job)

It will be noted that the first two of the six elements listed above are functions of the schools and of students in school. The middle two elements are descriptions of the initial jobs held by these individuals after graduation. The last two elements are the evaluations of the success or satisfactoriness of these individuals in terms of the job descriptions.

Introduction to the procedures

The procedures followed in making tests of relationships of the measurements and classifications above involved carrying out a number of tasks, which included:

---

[1]"Worker(s)" here refers to all workers in the group under supervision who meet the criteria of selection for the principal subjects of the study.

a) collecting the data from the subjects and from school records;

b) defining the limits of applicability of findings;

c) establishing a base for combining achievement measures from two or more schools;

d) defining all normally distributed characteristics in terms of appropriate standard scores;

e) defining the school programs in comparable terms;

f) defining the performance factors or content of jobs in comparable terms;

g) defining the "demandingness" of jobs in comparable terms;

h) conducting the ranking and rating procedures for relative satisfactoriness, on each of the success-criteria, and transforming these ranks to comparable scores;

i) analyzing the findings of meaningful relationships and non-relationships;

j) partially validating the representativeness of the schools by comparing subjects with co-workers from other schools;

k) checking differences between subjects "carelessly selected" with those "carefully selected," and interpreting other miscellaneous data.

The Statistical Methods

Numerical units

All computations in the study were made from one-digit values, to aid in computation and presentation. The reduction in precision from the two and three-digit figures in which some of the data were found in the school records is thought to be acceptable, because comparisons were made with other values where

four to six intervals or classifications were the maximum available. Also, comparisons were made chiefly through use of chi-square tests of significant differences--which meant that four to six groupings of data were the maximum permitted, since the expected frequencies per cell must exceed five (in all except an occasional cell) if valid chi-square statistics are to result.[1]

The distributions formed from data which can be assumed to be approximately normally distributed were assigned one-digit scores based on the "sten" ("standardized scores in tens") formula.[2] This formula was selected because:

a) it provides for the maximum number of intervals on a one-digit scale (by subtracting one from each value in making calculations);

b) it forms a distribution which divides at the median for median-split comparisons;

c) frequency distributions by "stens" can be interpreted in standard deviation equivalents; i.e., the distance between division points of the intervals can be read as one-half standard deviation.

"Stens" also would have been appropriate for scoring the ranks on satisfactoriness but were not usable because the worker-groups contained too few members to apply the percentage formula. Instead, a procedure was devised to obtain approximations of

---

[1]Walker, Helen M. and Lev, Joseph. Statistical Inference. New York: Holt, Rinehart and Winston, 1953. See page 107 for rules concerning expected frequencies per cell with varying degrees of freedom and varying acceptability of probabilities.

[2]Lyman, op. cit., pp. 94-95. The percentages assigned to each of the 10 intervals follow this order: 2%, 5%, 9%, 15%, 19% (median) 19%, 15%, 9%, 5%, 2%. Whenever a percentage line was found to cut through a cluster of equal scores, the value assigned to all scores in the cluster favored the majority side.

standard scores in what became essentially a system of classification into a scale of four intervals. In brief, this system began with having 5.5 represent the mean (as it does in the theoretical model of the "sten" distribution) with scores of six and seven above the mean and scores of four and five below the mean. Ranks were weighted according to the number in each ranked cluster.[1]

Sample size

The size of the basic sample (150) was chosen so that expected frequencies per cell would nearly always exceed five to meet the requirement of minimum expected frequencies per cell, but at the same time the sample was considered to be quite adequate for the exploratory purpose of the study.[2] The opportunities for analysis of sub-groups within the larger group was limited by the sample size, however.

Testing the hypotheses

Chi-square tests were computed in reference to null hypotheses. Since the nature of the data permits no rationale for fixing the exact probability values (associated with the chi-square statistics) at which significance of results will be recognized, the probability values are reported with an arbitrary acceptance of the null hypothesis for values of .10 or more, and an arbitrary rejection of the null hypothesis for values of .05 or less.[3] Values between .05 and .10 are neither

---

[1]Walker and Lev, op. cit., p. 480. Table XX, "Transformation of Ranks to Standard Scores," provided the based for interpolating ranks into numbers on the four-interval scale.

[2]Hays, William L. Statistics for Psychologists. New York: Holt, Rinehart and Winston, 1963, p. 332. Hays states that small samples are actually superior when the researcher's purpose is to explore a problem economically and where he is trying to map out the main relationships in some area.

[3]Walker and Lev, op. cit., p. 464. Probability values associated with the chi-square statistics are taken from Table VII, "Percentile Values of the Chi-Square Distribution."

accepted nor rejected. The confidence with which interpretations are made varies according to whether the specific findings form reinforcing clusters or appear singly.

Chi-square computations were performed through use of the UMSTAT 62 Program, "Chi-square from Raw Data,"[1] processed by the Control Data 1604 computer located at the Numerical Analysis Center, University of Minnesota. Both expected and observed frequencies were printed, to aid the writer in interpretations, although only the observed frequencies are presented in the tables. Chi-square tests were believed to be more suitable than some alternative statistical operations might have been, because most of the data were in the form of classifications, and only gross relationships were being sought.

Schools, Subjects and Community

The subjects

The group of 150 boys evidenced certain characteristics which would differentiate it from groups of college-bound youth or school dropouts. The group possessed characteristics in the form of somewhat restricted distributions of traits and aptitudes. It was discovered that the members of this group tended to be "C" and "D" students in English courses, but tended to do somewhat better in vocationally-oriented courses, and tended to have average scores in tests of general intelligence and differential aptitudes.

According to the defined criteria, members of this group were not school dropouts, they obtained jobs on the competitive market and kept them past the normal probationary period, and they did not go to college. It is not known how the subjects would have compared, as a group, with their classmates who entered military service upon graduation. At the time this study was conducted, the type of boy characterized by this

---

[1]Numerical Analysis Center, UMSTAT Computer Programs Manual. Minneapolis: University of Minnesota Numerical Analysis Center, 1964.

group was relatively neglected in educational research and development programs, with the greater efforts being made for the benefit of college-bound and disadvantaged groups.

The schools

Subjects of the study were selected male members of the 1963 graduating classes of three senior high schools in the metropolitan area of Minneapolis, Minnesota, which represented the three basic types of large public high schools in most metropolitan areas: an urban vocational high school, an urban comprehensive high school, and a suburban comprehensive high school. These may be symbolized as UV, UC, and SC, respectively. The schools were Vocational and Roosevelt senior high schools of the Minneapolis Public Schools, and the Robbinsdale Senior High School of Independent School District No. 281, Robbinsdale, Minnesota.

A reason for choosing these particular schools was that the comprehensive schools had large enough graduating classes so that in each school approximately 50 subjects would qualify, from one graduating class, under the criteria for selection of subjects (UC = 669, SC = 758). The vocational school had a much smaller class (UV = 291), but a much higher proportion were males who entered the labor market immediately upon graduation. The comprehensive schools were selected partly because they had a full range of clientele, with almost half from each school entering some kind of college program upon graduation.

The 150 high school graduates who became the principal subjects of the study were selected according to criteria defined in the present chapter. The objectives in devising the criteria were (1) to eliminate graduates who would tend to reflect the differences among schools, and (2) to eliminate graduates for whom an accurate evaluation would not likely be obtainable. Those who did qualify on the criteria would then presumably form groups with approximately similar characteristics from the several schools, and could then be evaluated with some validity.

Follow-up studies which were available in two of the schools were used to screen out those in college or those in military service for more than the six-month basic program. Homes of graduates of the third school were telephoned to determine each graduate's status. (The numbers in military service at the time the contact was made, 14 or 15 months after graduation, were: 34 from the urban vocational school, 44 from the urban comprehensive school, and 64 from the suburban comprehensive school. These numbers are roughly proportionate to the sizes of the graduating classes.)

Sol to ME

The community and the employment climate

At the time of the study Minneapolis was a city of a half-million population, with suburban municipalities totaling almost another half-million, and with the adjacent city of St. Paul and suburbs adding more than a half-million, for a metropolitan area total exceeding 1½ millions. The business and industry of the area featured electronics and similar industries requiring a high proportion of technically-trained people, along with a predominance of light industry and the normal service and commercial enterprises of a metropolitan area.

The employment climate at the time the data were gathered was favorable, with unemployment rates lower than average for the 1955-1965 decade. This factor is of importance because application of the criteria for selection of subjects during a time of economic recession and high unemployment would probably affect the distributions of characteristics of the subjects, in that some of those who were employed past 90 days in this study would not qualify on this criterion. The technical emphasis of the area's industry is not thought to have affected the study greatly, because very few of the entry-jobs were at the higher levels of skill requirements.

Three Sources of Data

Interviews with the subjects

Each boy from the 1963 graduating roster who was seemingly eligible as a candidate for the study was telephoned by a guidance counselor from his school and engaged in a structured interview. For each boy interviewed the counselor recorded the place of work, the job description, the starting and ending dates of the job to be studied, the name of the direct job supervisor, and the method of obtaining employment. Various questions were asked about whether or not school experience assisted in performance of certain tasks. (A copy of the interview form appears in Appendix B as Form I.)

Data from school records

The investigator obtained from the official school records certain information regarding each subject. These data included the class rank, grade average in six semesters of required English, grade average in vocationally-oriented courses for those so qualified, an intelligence quotient, scores on five scales of the Differential Aptitude Tests, the composite number of days absent and/or tardy in grades 10-12, and a list of the vocationally-oriented courses

taken and consequent classification of each graduate as either "vocationally-oriented" or "general." (A copy of the form used to record data from school records appears in Appendix B as Form II.)

The interviews with employers

The employers were interviewed personally by the investigator at the 123 places of employment. The procedure followed was to first telephone each place of employment to obtain the name and title of the proper person to contact for obtaining permission to conduct an interview. Letters followed (individually typed but identical except for the inside address and salutation), mailed to groups of employers selected geographically. (A copy of this letter and the accompanying explanation appears in Appendix B as Form III.)

Next, the officials to whom the letters had been addressed were telephoned and appointments for interviews were arranged with the officials contacted (who were owners or personnel directors), plus interviews with foremen or supervisors. More often than not two persons were interviewed to obtain evaluations concerning each job-situation.

In each interview, the descriptions of the jobs and the periods of time worked, as submitted earlier by the subjects, were confirmed or modified by the employer, and a few additional questions were answered. (The form used to record background information from employers appears in Appendix B as Form IV, Part A, and a list of all employers appears in Appendix C.)

Defining the jobs. After providing the background information, each employer classified the job in question as best fitting one of six classifications, according to the priority order of the three job-content factors defined for this purpose. Each employer also classified the job according to a four-point hierarchy of "demandingness." (The operations noted immediately above are described in detail subsequently. Copies of the cards used to rank the job-content factors appear in Appendix B as Form IV, Part B. The demandingness scale is the last item on Form IV, Part A.)

Ranking of workers among clusters of co-workers. After ranking the job-content factors, the employer ranked each principal subject on each factor, among the cluster of comparable co-workers. (A copy of the name slip used in obtaining the rankings appears in Appendix B as the last item on Form IV, Part B.) In most cases, the identity of the principal subject was not disclosed to the supervisor who did the ranking, to avoid the chance of bias, although identification of the subject often had to be made to the company owner or

personnel director to help establish proper rapport for the interview. The sequence of ranking was made, in each instance, in the order that the three factors were considered to be important to each job. Then, a similar ranking was made on "Overall Satisfactoriness," and, finally, the employer rated the workers in the cluster as "Satisfactory" or "Unsatisfactory."[1]

The investigator attempted in each interview to obtain from the supervisor a minimum of three comparable co-workers and a maximum of five, after it was discovered in the initial interviews that the interview became cumbersome with more than six individuals to compare. In a few instances, where more than six were qualified for ranking, the group was reduced by choosing only those who were 1963 graduates of local high schools, or, in a few cases involving larger numbers, the first six graduates of 1963 listed (alphabetically) were used.

Applicability of the Findings and Limitations of the Design

Applicability of findings

To make the format of these comparisons (and some hypotheses for further testing) applicable to similarly selected graduates of many or most high schools, a basic assumption was first partially tested. This assumption was: when the criteria used in this study for selecting subjects are applied to the graduating classes of three varying types of high schools, one year after graduation, the resulting groups of subjects would not differ significantly on selected school-measured criteria (an intelligence quotient, five scales of an aptitude test battery, and the attendance record). The rationale here advanced is that, if the preceding assumption could be defended through demonstrating that the groups selected by the given criteria from three differing types of schools were substantially similar, then the same assumption could be extended to groups selected by the defined criteria from many or most high schools.

The three high schools from which subjects of this study graduated were selected from the three basic types of public

---

[1]The basic ranking procedure is patterned somewhat after the procedure used by Carlson, et al., in The Measurement of Employment Satisfactoriness, op. cit., p. 55.

high schools which can be found in most metropolitan areas: (1) a vocational high school located in the city-center which draws students from throughout the city school system; (2) a comprehensive high school which serves a mainly-residential portion of the city school system; and, (3) a comprehensive high school which serves a mainly-residential suburb adjoining the city. To provide support for the assumption of similarity, it was necessary to ascertain whether or not the selected subjects from these three schools differed significantly, as groups, on the selected indicators of school achievement and on the attendance record.

Limitations of applicability

No conclusions resulting from carrying out this design could properly apply to whole school populations. Even to the populations selected through the given criteria, applications of results are properly made only as hypotheses for further testing. The foregoing statement is true for three separate sets of reasons.

First, some of the basic instruments or techniques of measurement (of job content, of worker "satisfactoriness," and of the demandingness levels of the jobs) are not validated or established instruments or techniques but rather are presented in pilot form in this study, and if they are to acquire validity they must be developed and refined in further research.

Second, the observations made were on deliberately selected populations, extracted from the complete populations of the schools by use of criteria which tended to limit the observations to subjects from the middle ranges of the post-high school population (those in post-high school education tended to be drawn from the upper academic and/or socio-economic levels, and the dropouts and the unemployed tended to be drawn from the lower academic and/or socio-economic levels, leaving the middle ranges predominant in the study).

Third, comparisons of groups of subjects from the three schools did not include socio-economic comparisons or comparisons of disciplinary records, or other factors which might be proposed as causes of differences among the school-groups. (The assumption made here is that these latter comparisons would also show no significant relationships, if the same selective criteria were applied in designating the groups.)

The Assumption that Subjects Selected on the Defined Criteria are Similar, as Groups, from School to School

It has been noted that the findings of the study could have little value for generating hypotheses for further testing unless the findings could be shown to apply to groups similarly selected from many or most high schools. To establish or reject the reasonableness of this statement of applicability, two procedures were utilized.

First, criteria were used in selection of subjects which presumably caused the resulting groups to be distributed similarly from school to school. Second, the data were assembled and compared through statistical means.

The criteria for selection of subjects

a) Male sex only. Because sex differences would be present in many school achievement and job success evaluations, this factor was controlled by considering the male sex only.

b) 1963 graduating class. One large graduating class was presumed to have approximately the same distributions of characteristics among its members as another large class from the same school, because changes in a school's clientele are thought to occur slowly, over a period of years.

c) No post-high school training. Because the effects of high school programs were to be studied, graduates with post-high school training were eliminated. Exceptions were college dropouts after one quarter or semester of study unrelated to the job, or those with six months of military service in which no training other than basic training was given.

d) No apparent handicaps. Many retarded or otherwise handicapped students did not graduate, but those few who did would presumably be at a disadvantage in seeking employment, and so were eliminated. It was presumed that most Negro graduates would be at a disadvantage in obtaining employment because of employers' biases, and in this sense Negro graduates were considered for elimination as "handicapped." However, it was discovered that no Negro graduates qualified otherwise. Those few who graduated entered college or the armed services or were unemployed when contacted.

e) Unmarried. Married graduates were presumed to have stronger motivational influences which affect work success, and therefore were eliminated from the study. Those who were married at the time the investigator conducted the evaluation interview with the employer, but who were unmarried at the point of evaluation (usually when passing the 90-day probationary period) were included.

f) A minimum tenure. A three-month period was considered the minimum time needed for the employer to know the subject well enough for ranking him against co-workers who also had worked at least 90 days and were similar in other respects. This also eliminated those who might have been entirely without full-time employment during the year following graduation.

The above criteria tended to eliminate graduates from the upper end of the school achievement scales and also some from the lower end. In addition, some subjects were eliminated for reasons unrelated to their qualifications for employment. These latter reasons affected fewer individuals and were presumed to be associated with graduates who would be randomly distributed on other criteria. Graduates thus eliminated included the following:

a) Graduates who had moved away from the Twin Cities area;

b) Graduates who had worked under a supervisor who was either unavailable or uncooperative; (only two employers were found to be uncooperative, and seven were unavailable);

c) Graduates who had worked where the supervisor was unable to recall comparable young workers who did the same work, and therefore could not be assigned a rank; in all but three cases supervisors could recall a sufficient number of former workers who qualified on the given criteria so that the rankings could be assigned;

d) Graduates who had worked for a relative or neighbor, or in a situation where the supervisor would be substantially influenced by knowledge of a worker's "connections with the boss"; the counselors eliminated the obvious cases in the telephone interviews, and in a few borderline bases the writer managed to arrange the interview with supervisors who showed no apparent bias--evidenced by the fact that they ranked the principal subject below average.

The criteria for comparing school groups

a) A group-administered test of intellectual aptitude (I.Q.), recorded in the junior high years. The Otis Form B was the test most commonly recorded for 1963 graduates, but scores of other tests were used when the Otis had not been given, as other group-administered intelligence measures are thought to be comparable enough for this criterion.

b) The senior high school attendance record, computed as all absence plus tardiness in grades 10 through 12.

c) The Differential Aptitude Tests, administered in Grade 9.[1] Scales for Verbal, Numerical, Abstract, Space, and Mechanical aptitudes were used. A few subjects did not have these tests recorded for them, and so these were treated as missing data in the calculations.

Table 3 illustrates the distributions of intelligence quotients which were recorded for the three school-groups, with the one-digit values assigned to the respective intervals. The percentages assigned to each value are based on the "sten" formula for approximating standard scores.

Table 4 illustrates the distribution of the attendance record, which for each subject is his combined absence and tardiness in grades 10 through 12.

Tables 5 through 9 illustrate the distributions of scores on the Differential Aptitude Tests, with assigned one-digit values. The scores as recorded in school records were found in percentile ranks grouped in intervals of five.

Testing the similarity of the school groups

It was apparent that the study could not proceed further until the assumption that the school-groups were similar in distributions of characteristics was defended. Therefore, tests of significant differences were conducted as part of the design.

Because the principal subjects were selected, and were not sampled from populations whose distributions of tests scores and other measures could be assumed to be normal, the question of normality arose. Examination of the distributions given in Tables 3-9 provided a reasonable basis for assuming that very large samples of subjects selected similarly would approximate normal distributions. The application of the "sten" formula was therefore considered to be appropriate.

Chi-square tests of goodness of fit were computed, relating the three school-groups with the distributions of intelligence quotients, five scales of the Differential Aptitude Tests, and the three-year attendance record.

The null hypotheses were:

a) There are no significant relationships between distributions of intelligence quotient and school attended;

b) There are no significant relationships between distributions of attendance record and school attended;

c) There are no significant relationships between distributions of Verbal scale of the DAT battery and school attended;

d) There are no significant relationships between distributions of Numerical scale of the DAT battery and school attended;

e) There are no significant relationships between distributions of Abstract scale of the DAT battery and school attended;

f) There are no significant relationships between distributions of Space scale of the DAT battery and school attended;

g) There are no significant relationships between distributions of Mechanical scale of the DAT battery and school attended.

Findings with respect to the above hypotheses

Factor vs. Schools	X^2	d.f.	p	Sig.	Table No.
Intelligence quotient	15.449	10	$.25 > p > .10$	No	3
Attendance record	11.132	10	$.50 > p > .25$	No	4
Verbal DAT	8.338	10	$.75 > p > .50$	No	5
Numerical DAT	7.613	10	$.75 > p > .50$	No	6
Abstract DAT	12.993	10	$.25 > p > .10$	No	7
Space DAT	10.228	10	$.50 > p > .25$	No	8
Mechanical DAT	20.439	10	$.05 > p > .025$	Yes	9

The probability values associated with the chi-square statistic reached the significant level ($p < .05$) in only one instance, the Mechanical scale of the DAT battery. The other null hypotheses were accepted. This one relationship was further explored by testing the relationships between the Mechanical scale and (1) job content--to see if the Mechanical DAT related to obtaining jobs where technical skills were valued most, plus (2) the employers' rankings of workers on Skills Unique to the Job. The probability values associated with the chi-square statistics in these latter tests were:

(1) $.75 > p > .50$ (Table 1A)
(2) $.90 > p > .75$ (Table 2A)

These findings are thought to justify the conclusion that the relationship between school attended and this one DAT scale (Mechanical) need not modify the basic assumption.

Interpretation

To present evidence that the school-groups are not significantly different in every potentially important respect would require that many additional comparisons be made, perhaps of socio-economic and attitudinal factors as well as factors related to academic aptitude and experience. For this reason, the interpretation is limited to a claim that the assumption is reasonable, and has been supported in part by evidence, that the school groups are enough alike so that equal proportions might be assigned the "sten" values on scales of school achievement and attendance.

PART TWO: DEFINING THE THREE PAIRS OF BASIC VARIABLES

School Achievement Measures and School Programs

At this point in execution of the design, the assumption that the school groups were similar had been accepted. Therefore, it became possible to assign the "sten" values to all distributions which approximated normal distributions.

The following sub-headings provide the detailed rationale concerning the variables and the derivations of the actual numerical values used in the specific statistical tests of relationships.

Of the three sets of basic variables, (a) school experience factors, (b) job definitions, and (c) evaluations of success in employment, the present section pertains to the first of these, the school experience factors, sub-divided into:

(1) the measures of school achievement, and
(2) the type of school program.

School Achievement

Measures of achievement such as class rank or letter grade averages in groups of related courses cannot be meaningfully compared from school to school in their raw form. A "C" in a school with strong academic competition might refer to the same level of performance (in terms of potential for succeeding in a particular program of a particular college) as a "B" would mean in another high school. This lack of a common base for comparisons is true

of whole graduating class populations, and is also true but in lesser degree for the school-groups selected by the criteria defined for the study.

Starting with the assumption that the school-groups selected were approximately equal in academic potential, motivation, and presumably other characteristics as well, it was then further assumed that the groups were also approximately equal in total school achievement, English achievement, and achievement in vocationally-oriented courses.

That is, if it turned out that the groups from one school had higher English grades (for example) than the average English grades of groups from the other schools, it was assumed that they were equal, on the average, in "real" achievement, and so assigning the "sten" values according to the "sten" percentage formula caused the distributions to be scored equally, with a student from the vocational school with a "B" average possibly receiving the same "sten" score as a student with a "C" average from the suburban comprehensive school. (A difference of a whole letter grade was not unusual, especially in vocationally-oriented courses and in total grade average, chiefly because the bulk of the recipients of high marks in the comprehensive schools were in college and were not subjects of the study.)

Class rank. It is consistently reported in the literature that the high school class rank is equal to or better than any other predictor of relative rank in college.[1] This is especially true when investigations are restricted to the graduates of specific high schools who attend specific colleges. The results are probably caused in part because graduates of "strong" high schools tend to attend "strong" colleges, and vice versa.

An objective of the present study was to test for predictive relationships between high school rank and subsequent success in employment, somewhat parallel to the predictive relationship between class rank and college success. The parallel relationship is thought to be that letter grades assigned by teachers or professors are a form of "ranked satisfactoriness," which roughly follow a normal distribution, and that employers can also rank small clusters of workers on their "satisfactoriness."

One potentially serious problem, involving the differences in the meaning of a particular letter grade within a high school, is thought to be controlled in this study. That is, considering

---

[1] Garrett, op. cit., pp. 91-96.

two students of equal ability who attend the same high school, Student X might achieve a "C" average in the college-preparatory curriculum with greater effort than Student Y expends in achieving a "B" average in the "non-college" curriculum. However, just as most of the subjects of the studies of relationships between high school and college achievement are products of college preparatory high school curricula, the subjects of the present study are almost all products of non-college preparatory curricula.

Table 10 illustrates the distributions of class ranks as percentile ranks, with conversion to "sten" scores.

English grade average. One purpose of this study was to explore the idea that most jobs include tasks or operations which relate to the worker's background in the general academic or liberal arts area of studies, and that other tasks or operations relate to the worker's training in skills and knowledge that are unique to the job at hand. English was chosen to represent the academic area for two reasons. First, English is representative of most of the "3 R's" of education ("communications competency" might have been called "basic literacy"). Second, six semesters of required English instruction have been completed by every graduate in the study.

Table 11 illustrates the distributions of English grade average with conversion to "sten" scores.

Grade average in vocationally-oriented courses. Parallel to the selection of English as an area of achievement, a purpose of this study was to explore the relationship of school achievement in vocationally-oriented courses (such as industrial arts sequences of more than one year and courses in business and distributive education) with rankings by job supervisors on the factor called "skills unique to the job."

Table 12 illustrates the distributions of grade average in vocationally-oriented courses, with conversion to "sten" scores.

Classification by school program

One primary purpose of the study was to compare the jobs and job-success of graduates who had a heavy concentration of vocationally-oriented courses in senior high school with graduates who had only a few vocationally-oriented courses or none. In order to utilize data from all subjects in the study, the graduates were classified as either "vocationally-oriented" (Group I) or as "general education" (Group II). The dividing line was arbitrarily fixed in what is essentially a continuum of background and therefore the

[1]3.00 = "B", 2.00 = "C", 1.00 = "D". In three instances where approximately double the normal "sten" percentages occurred in clusters with the same score, the cluster was split according to whether the English grades were ascending or descending over the 3-year period. This procedure was believed to have more merit than the usual method of alternating selections.

classification did not have the discriminating power that might have been possible if only those with the largest amount of vocationally-oriented training had been compared with others who had none.

Table 13 presents the frequencies of the "vocationally-oriented" and the "general" classifications (Groups I and II), with the "vocationally-oriented" group divided into those with jobs which are related to the training received (Group IA) and those with jobs not related to training (Group IB), with the frequencies further indicated for the three schools.

Urban Vocational	29	26	55	
Urban Comprehensive	15	20	35	16
Suburban Comprehensive	8	14	22	22
	52	60	112	38

The subjects who had eight or more completed semesters of vocationally-oriented courses were placed in the vocationally-oriented classification on this qualification alone. A prior decision which was made in conducting the classification of graduates was the classification of each course in the curriculum into "vocationally-oriented" or "general" categories. At the vocational high school, courses were so classified by state regulation. In the comprehensive high schools, courses were identifiable by statements of purpose found in the programs of study as adopted by the subject departments within the schools. The school counselors made these designations.

Subjects who had completed five or fewer semesters of vocationally-oriented courses were classified as "general." The border-

line cases, those with six or seven semesters of vocationally-oriented courses, were decided on by the school counselor, who based his judgment on whether or not the six or seven semesters contained either a concentration in one specific field (e.g., four semesters of auto mechanics plus two semesters of machine shop) or a cluster of closely related courses (e.g., two semesters of machine drafting, two of machine shop, two of industrial metals, plus one semester of shop math). In most instances, six semesters or one hour a day for three years was considered to be a proper inclusion for a general education program.

Classification of the "vocationally-oriented" graduates according to whether or not each had obtained a job related to his field of training was also made by the school counselors. The question which appears at the bottom of Form II, Appendix B, served to orient the counselors in making the classification, which was not done until the investigator had completed the interviews with the employers, so that the employers had confirmed or modified the job descriptions submitted by the subjects of the study.

The Definitions of Jobs

Of the three sets of basic variables, (a) school experience factors, (b) job definitions, and (c) success in employment, the present section pertains to (b), the job definitions, sub-divided into:

(1) job content emphases, and
(2) demandingness of job.

As noted earlier, these criteria are the result of instruments or evaluative techniques which were arbitrarily devised for the purposes of this study. They help to define in a simple manner two basic dimensions of any job: (a) the content of the job as reflected by the relative importance of three operations of the workers, and (b) the difficulty of performing the job, or the demandingness of the job on the worker's capacity.

The job-content definitions

The technique of asking each employer to define the job in question by assigning a relative order of importance of three arbitrary job-performance elements was contrived to make classifications possible in the short period of time allowed for each interview, and also to reduce the classifications to a number adaptable to chi-square tests with 150 subjects.

Each employer placed the job under discussion into one of six classifications by indicating the order of importance to the job of the three performance elements: (a) Communications Competency, (b) Personal Adequacy, and (c) Skills Unique to the Job. The factor ranked first has been termed the "emphasis" of the job. The operational definitions of these factors were given to the employers on cards, copies of which appear in Appendix B as Form IV, Part B, items 1, 2, and 3.

Rationale of the job content factors. The following rationale may help to establish the relationships of the job-content factors to school curriculum.

First, school curriculum has been defined for this study as a composite of experiences which is extremely difficult to separate into components which can be shown to have specific and measurable outcomes. The three major components have been described as intellectual and artistic development, preparation for home and civic responsibilities, and preparation for the world of work.

Second, the three elements of performance in almost any job are described, for purposes of this study, as "communications competency," "personal adequacy," and "skills unique to the job." These are arbitrarily assumed to have some degree of logical relationship to the three objectives of curriculum, which are preparation for intellectual fulfillment, social obligations, and vocational competency.

Third, obtaining a job in which one of the above factors is predominant may be related to the quantity and quality of experience in the associated areas of curriculum. Do the best students in vocationally-oriented courses get the jobs where the skills factors rank highest? Also, relative success (such as a rank given by a supervisor) may be related to the quality and quantity of school experience in the associated area. Do the best students in English tend to be ranked higher on communications competency?

The supposition of the investigator was that the outcomes were not likely to be distinguishable, but that the tests should be made, to support or not support the supposition.

Definition by "demandingness"

The classification system for placing all jobs obtained by the subjects of the study into four levels of "demandingness" was devised because a method was needed to obtain the desired information in the interviews with employers.

Each employer interviewed indicated that the job under discussion fit best into one of four classifications, arranged in a hierarchy of "demandingness." These levels were clarified by the following descriptions. (The interview form containing these descriptions appears in Appendix B as Form IV, Part A.)

a) "This is a tough job to fill for a boy just out of high school; he not only has to have specific skills but he has to be dependable and quick to learn."

b) "The boy doesn't have to have much special training other than a high school education, but he has to be dependable and quick to learn."

c) "Most high school graduates can learn to handle this job if they are honest and willing, but it does take awhile to learn the operations if they haven't learned them in school."

d) "Almost any boy can handle this job if he is honest and willing, and he can pick up all the essential operations in a few days."

Employers were assisted in making this classification by an illustration presented orally by the investigator:

> "In an automobile service station we would think of it in this way: If a boy merely pumped gas and did clean-up work he would be in the lowest classification; if he greased and serviced cars and therefore had to follow the charts for all the makes and models he would move one step higher; if he were in charge of a shift or if he had to do a variety of mechanical repairs he would be next to the top, and, if his job required that he do major repair work or keep the books for a station he would be in the top category."

It will be noted that there is no basis for assuming that the intervals between classification have equal "distance" between them; therefore, the four levels are limited in their suitability for statistical handling. It <u>was</u> assumed, however, that they are in proper hierarchical order and could be so treated.

The breakdown of all jobs into 24 definitions was accomplished by assigning each to a cell as illustrated in Figure 2. (The frequencies which occurred appear in Table 18.)

	1 (less)						

Evaluations of Satisfactoriness

Of the three sets of basic variables, this section pertains to the last set, concerning success in employment, sub-divided into:

(1) rankings of satisfactoriness, and
(2) ratings as satisfactory or unsatisfactory.

Ranks on the content areas and on overall satisfactoriness

In the structured interview with employers, the investigator asked each employer to arrange slips with names of comparable workers from best to poorest on each of the job content areas--"Communications Competency," "Personal Adequacy," and "Skills Unique to the Job." This was done in the order of importance of the factors that the employer had previously designated. Next, the employer arranged the order of name slips on "Overall Satisfactoriness." It was pointed out that the last rank did not have to be an average, or reflection, of previous ranks for each worker, because of the possibility of missing factors.

The arbitrariness of this method of evaluation is acknowledged. One deficiency is the inflexibility of the definition in

the matter of excluding additional factors which may be as important as the three used. Some indication of the seriousness of this deficiency was obtained by asking each employer if the three factors seem to "cover the job pretty well." Nine employers nominated "output," and four employers nominated "drive and ability to be promoted."[1] The investigator believes that most employers tended to transfer values which they sensed, but could not express, into the given factors most closely associated. It is also believed that omission of important factors in a considerable number of cases would be reflected by an appreciable difference between the average rank on the three content factors and the rank on Overall Satisfactoriness--which did not occur (perhaps because of the "halo effect" among the rankings).

Ratings as Satisfactory or Unsatisfactory

Just as the employer completed arranging the name slips for the last time (on "Overall Satisfactoriness") he was presented with the following oral statement and was asked to respond to it.

> "Sometimes even the lowest ranking worker is completely satisfactory on minimum standards and sometimes one or more are not satisfactory. In this particular case, if all of these workers somehow left this employment and then wanted the jobs back that they held at the end of their probationary period, and they were performing at the level they performed at after 90 days, where would you draw the line between those you would want back and those you would rather see work somewhere else?"

Workers above the line were marked "S", for "Satisfactory," and those below the line were marked "U", for "Unsatisfactory."

It might be argued that when all subjects of a study have met the criterion of passing a 90-day probationary period, they would all be satisfactory at a minimum level. However, on the speculation that job supervisors do not necessarily fire workers

---

[1]Perhaps a more serious deficiency is the lack of a weighting system to provide for the cases where the evaluation on the second-choice factor (e.g., "C" in a PCS definition) is given the same value whether it is almost as important as the first-choice factor or if it has very little importance. This is a built-in deficiency which is present in all systems where highly complex matters are classified into too-few categories, but it is necessary if analysis of small samples is to be possible.

they consider to be less than competent, this rating was made to determine what proportion of the total group had passed a probationary period but was nevertheless considered to be "Unsatisfactory."

PART THREE: THE FORMAT FOR ANALYSIS

Outline of Relationships to be Tested

The relationships to be tested fell into three groups, corresponding to the three possible combinations of the three sets of major variables described in Part Two. These are:

a) achievement and program vs. job definitions

b) job definitions vs. evaluations of satisfactoriness

c) achievement and programs vs. evaluations of satisfactoriness

These relationships can be represented by the following general statements:

a) Comparisons of the sub-sets of specific relationships between (1) school achievement or programs taken and (2) the jobs (as defined by content and demandingness) provided information concerning tendencies for graduates with certain types of school background to obtain certain types of jobs.

b) Comparisons of the sub-sets of specific relationships between (1) the jobs (as defined by content and demandingness) and (2) the rankings or ratings of satisfactoriness had no independent general hypothesis. The specific null hypothesis applied to testing relationships between each pair of variables resulted chiefly in findings which helped to interpret the relationships which have independent meaning.

c) Comparisons of the sub-sets of specific relationships between (1) school achievement or programs taken and (2) the rankings or ratings of satisfactoriness provided some insights about whether or not high school achievement can be used to predict the relative success of young workers in entry-jobs in much the same way that high school class rank can be used to predict relative success or achievement in college.

Preliminary Tests and Information

Before moving into the testing of the three major sets of variables, it became necessary to answer four preliminary questions so that the interpretations of the major tests would reflect the benefits of these prior considerations.

The four questions follow, accompanied by indications of the tests which were conducted in providing answers.

a) Do graduates of the general and vocationally-oriented programs differ significantly in achievement?

Question (a) applies only to the two comprehensive high schools because the vocational high school had no general graduates. There was no need to remove the observations from the vocational high school from the computations, however, since the "stens" assigned were all of one classification and were assigned according to the percentage formula which determined the expected frequencies.

The null hypothesis implied in the relationships tested was that there are no significant relationships to be found between general and vocationally-oriented graduates on the measures of school achievement.

The relationships tested to answer question (a) are:

(1) General or vocationally-oriented program vs. class rank

(2) General or vocationally-oriented program vs. English average

(3) General or vocationally-oriented program vs. attendance record

b) Do vocationally-oriented graduates from one school fare better than graduates of other schools in obtaining jobs related to their training?

The relationship tested to answer question (b) pertains to the proportions of vocationally-oriented graduates of the three schools who did or did not obtain jobs related to their training, and it was answered through conducting the chi-square test of significant relationships outlined below.

(4) Vocationally-oriented graduates classified by relatedness of jobs to training received vs. school attended

c) How do the two major dimensions of the jobs relate? Which job-content factors are associated with the more-demanding or less-demanding jobs?

Answering question (c) helped to set the stage for the three major sets of tests. An answer was provided by testing the relationship between the job-content emphases (order of importance of the three job-content factors) and the demandingness levels of the jobs.

This relationship is illustrated in Figure 1, and is outlined as follows:

(5) Job content emphasis
vs. demandingness level of job

d) How consistently do employers rate workers "Unsatisfactory" who are also ranked lowest in their co-worker group on "Overall Satisfactoriness?"

A last preliminary test was made to ascertain the relationship between the two major evaluations of satisfactoriness, the rank on "Overall Satisfactoriness" and the rating as "Satisfactory" or "Unsatisfactory." It was also of interest to learn the proportion of workers who had presumably passed a probationary period who were nevertheless rated "Unsatisfactory."

The latter test is outlined as follows:

(6) Rank on "Overall Satisfactoriness"
vs. rating as "Satisfactory" or "Unsatisfactory"

School Achievement and Program vs. Job Content and Demandingness

The first of three sets of major relationships analyzed was that which was intended to cast some light on the question: What kinds of boys get what kinds of jobs? The main assumption behind this question was that distinct relationships probably do exist between levels of school achievement and the definitions of jobs which the higher or lower achievers get. The objective of the study most closely related to this point is that of trying out the contrived methods of defining job content and demandingness.

Examples of the sub-questions were: (1) Do the higher achievers in English tend to get the jobs where Communications Competency is valued most? (2) Do those with the best attendance records tend to hold jobs where Personal Adequacy is valued most? (3) What kind of achievement, if any, tends to relate to higher or lower demandingness levels of jobs?

Similarly, the subjects from vocationally-oriented programs were compared to those from the general programs, to see which ones might tend to get jobs with certain definitions according to content or demandingness. Finally, the vocationally-oriented classification was sub-divided into those with and without jobs related to school training, and these sub-divisions were compared.

The four sub-sets of relationships which were examined are outlined below.

a) Relationships between <u>the school achievement measures</u> and the <u>job-content designations</u>:

(1) Class rank
vs. job content;

(2) Grade average in required English courses
vs. job content;

(3) Grade average in vocationally-oriented courses
vs. job content;

(4) Attendance record
vs. job content.

b) Relationships between <u>the school achievement measures</u> and <u>the demandingness of jobs</u>:

(1) Class rank
vs. demandingness;

(2) Grade average in required English courses
vs. demandingness;

(3) Grade average in vocationally-oriented courses
vs. demandingness;

(4) Attendance record
vs. demandingness.

c) The relationship between the school program and the job-content designation.

d) The relationship between the school program and the demandingness of jobs.

e) The relationship between having or not having a job related to training received (vocationally-oriented only) and the school achievement measures:

(1) Vocationally-oriented graduates classified by relatedness of jobs to training received vs. class rank;

(2) Vocationally-oriented graduates classified by relatedness of jobs to training received vs. English grade average;

(3) Vocationally-oriented graduates classified by relatedness of jobs to training received vs. grade average in vocationally-oriented subjects;

(4) Vocationally-oriented graduates classified by relatedness of jobs to training received vs. attendance.

The Job Definitions

vs. Evaluations of Satisfactoriness

The second of three sets of major variables tested for significant relationships was that which related the job definitions (job-content and demandingness) to the evaluations of success in employment (rankings on satisfactoriness and rating of satisfactory or unsatisfactory).

The sub-sets of specific relationships which were tested are:

a) Relationship between the job content disignations and the satisfactoriness rankings:

(1) Job content vs. rank on Communications Competency:

(2) Job content vs. rank on Personal Adequacy:

(3) Job content
vs. rank on Skills Unique to the Job;

(4) Job content
vs. rank on Overall Satisfactoriness.

b) Relationships between the demandingness designations and the satisfactoriness rankings:

(1) Demandingness
vs. rank on Communications Competency:

(2) Demandingness
vs. rank on Personal Adequacy;

(3) Demandingness
vs. rank on Skills Unique to the Job:

(4) Demandingness
vs. rank on Overall Satisfactoriness;

c) The relationship between the job content designation and the Satisfactory or Unsatisfactory rating.

d) The relationship between the demandingness designation and the Satisfactory or Unsatisfactory rating.

As in the case of relationships between the job definitions and achievement and programs taken, the relationships listed in this second set had value in setting the stage for interpretation of the relationships which were most central to the study--achievement vs. satisfactoriness.

The relationships with the satisfactory-unsatisfactory rating reflected a somewhat different dimension. Where the rankings were limited to indicating the subject's position in his own co-worker group (where an excellent worker among other excellent workers may be ranked "average" and a poor worker among other poor workers may be ranked "average") the "satisfactory-unsatisfactory" classification was presumed to indicate the employer's satisfaction with his employee on a more "absolute" basis. It is thought to be an indication of whether or not the employer has taken the trouble to recruit and retain workers he is pleased with, and/or whether or not he dismisses those he is not pleased with.

Testing the relationships indicated in (c), above, was designed to test a supposition that one or more types of jobs (as identified by the content classifications) tend to be associated with employers who are dissatisfied with their workers. Testing the relationships indicated in (d), above, was designed to test a supposition that jobs which are higher or lower in how demanding they are of the worker tend to be associated with employers who are happy or unhappy with their workers with disproportionate frequency.

School Achievement and Programs vs. Evaluations of Satisfactoriness

The third set of relationships focused directly on the central problem of the study--particularly on the relationship between achievement and satisfactoriness.

Figure 3 illustrates the relationships involved when school programs were compared to satisfactoriness in employment.

The following outline of specific relationships which were tested between school programs and satisfactoriness contains all combinations which were considered to be potentially meaningful. General education graduates were not involved in tests comparing subjects with and without jobs related to high school training.

a) Relationships between the school program taken and the satisfactoriness rankings:

(1) Vocationally-oriented or general program vs. rank on Communications Competency;

(2) Vocationally-oriented or general program vs. rank on Personal Adequacy;

(3) Vocationally-oriented or general program vs. rank on Skills Unique to the Job;

(4) Vocationally-oriented or general program vs. rank on Overall Satisfactoriness;

(5) Vocationally-oriented graduates classified by relatedness of jobs to training received vs. rank on Skills Unique to the Job:

(6) Vocationally-oriented graduates classified by relatedness of jobs to training received vs. rank on Overall Satisfactoriness

b) Relationships between the school program taken and the Satisfactory or Unsatisfactory rating:

(1) Vocationally-oriented or general program vs. Satisfactory or Unsatisfactory;

(2) Vocationally-oriented graduates classified by relatedness of jobs to training received vs. Satisfactory or Unsatisfactory.

Figure 4 illustrates the relationships involved when measures or indicators of high school achievement are compared to satisfactoriness in employment.

Sections (c) and (d) of the outline, below, pertain to the relationships illustrated in Figure 4.

c) Relationships between the school achievement measures and the satisfactoriness rankings:

(1) Class rank vs. rank on Communications Competency;

(2) Class rank vs. rank on Personal Adequacy;

(3) Class rank vs. rank on Skills Unique to the Job;

(4) Class rank vs. rank on Overall Satisfactoriness;

(5) Grade average in required English courses vs. rank on Communications Competency;

(6) Grade average in required English courses vs. rank on Personal Adequacy;

(7) Grade average in required English courses vs. rank on Skills Unique to the Job;

(8) Grade average in required English courses vs. rank on Overall Satisfactoriness;

(9) Grade average in vocationally-oriented courses[1] vs. rank on Communications Competency;

---

[1]General education graduates are not involved in relationships (9), (10), (11), and (12).

FIGURE 3

d) Relationships between the school achievement measures and the Satisfactory or Unsatisfactory ratings:

(1) Class rank
vs. Satisfactory or Unsatisfactory;

(2) Grade average in required English courses
vs. Satisfactory or Unsatisfactory;

(3) Grade average in vocationally-oriented courses
vs. Satisfactory or Unsatisfactory;

(4) Attendance record
vs. Satisfactory or Unsatisfactory.

The procedure in testing the relationships listed above was to first test the "satisfactory and unsatisfactory" and "overall satisfactoriness" variables against each of the four achievement measures. Next, the logically related pairs were tested.

Testing for Differences in Recruitment and Selection Procedures

As noted earlier, one of the limitations of the study is that in comparing any two places of employment, where the workers do an identical job, the standards of selection might be high in one place and low in the other. Consequently, all workers might be satisfactory in the place which selected "carefully," and one or more might be unsatisfactory in the place which selected "carelessly."

This concept was used and tested in two ways. First, the standard scores assigned to the rankings on job performance were adjusted somewhat, favoring those selected carefully, to discover if this might have resulted in a closer relationship between rank on job performance and scores on predictor factors. Second, the top fourth or third (on the variable of how carefully or carelessly selected were the workers) was compared with the bottom fourth or third, to discover if these groups were distinguishable on any of several factors which might be meaningful.

Selecting the high and low groups on carefulness of selection was accomplished by an arbitrary formula. The "carefully selected" group was composed of those workers who were not only interviewed, but where the employer also had contacted the school for a recommendation, and/or had required that applicants have a particular vocational course background, and/or had administered appropriate screening tests. The "carelessly selected" group was composed of those who had come to the employer ("walked in") without being recruited through either schools or employment offices, and in addition were interviewed only, with no tests or other screening devices or checking of references.

Comparing Principal Subjects with Co-Workers

One of the assumptions of the study as described thus far was that the co-workers would be "comparable" to the principal subjects. After the initial data on the 150 principal subjects were analyzed, selected data on a sample of 90 of the co-workers were gathered, and tests were conducted which helped to answer the following questions:

a) Are the co-workers who do the same work as the principal subjects approximately equal, as a group, to the principal subjects, as measured by I.Q., attendance record in school,

and the Differential Aptitude Tests? (The co-workers used were those who graduated from high school in 1962, 1963, and 1964, so that age differences would be minimized.)

b) Are the ranks and ratings of job performance approximately equal, comparing the co-worker and principal subject groups?

CHAPTER IV

FINDINGS AND INTERPRETATIONS

Introduction to Chapter IV

The statistical findings of the study are given in the present chapter, along with interpretations as they seem appropriate. Tables are inserted when they serve as necessary visual aids to the text; tables are relegated to the Appendix if their primary function is to serve as possible references.[1]

It should be noted again that the findings and interpretations of this study should not be considered as "conclusions" in the usual sense. The term "interpretations" was selected as a replacement for "conclusions" in the chapter title for this reason. A combination of limitations--of measuring instruments and of an artificially structured "sample"--restricted the conclusions of this study to a pilot level, i.e., to supporting or not supporting hypotheses for further testing. (As a pilot study, the proper conclusions are to be found in the Recommendations for Further Study, in Chapter V.)

In the sections of the chapter which follow, the topics are presented in the following sequence:

First, preliminary tests and information;

Second, relationships between:
school achievement or programs
and the jobs (defined by content and demandingness);

Third, relationships between:
the jobs (defined by content and demandingness)
and satisfactoriness (as evaluated by employers);

Fourth, relationships between:
school achievement or programs
and satisfactoriness (as evaluated by employers);

---

[1]Tables are numbered 1A, 2A,..... nA, in the Appendix. All tables which pertain to the tests between the three major sets of relationships, identified as I, II, and III in this chapter, appear in Appendix A, and some are repeated in the text.

Fifth, comparisons of co-workers to the original group of 150, plus relationships between selection procedures and other variables

Sixth, interpretations of combinations of findings.

Preliminary Tests and Information

Certain findings concerning relationships between the members of each major pair of variables provided information which helped to set the stage for the tests of relationships between the sets of variables.

In regard to the school experience factors, tests were conducted to ascertain relationships between (1) the school program emphasized by the graduates, and (2) the measures of achievement and attendance.

Concerning the job definitions, tests were conducted to ascertain relationships between (1) the job-content emphases, and (2) the demandingness of jobs.

In regard to the evaluations of satisfactoriness, a test was conducted to ascertain the relationship between (1) the ranking on "Overall Satisfactoriness" and (2) the rating of "Satisfactory" or "Unsatisfactory."

Achievement of general vs. vocationally-oriented graduates

The assumption that the selected school groups are similar (demonstrated as reasonable and partially tested as shown in Chapter III), made it possible to test a dependent assumption, that the general and vocationally-oriented groups are approximately equal in the measures or indicators of school achievement--including attendance.

Chi-square tests were conducted, based on null hypotheses that there are no significant relationships between the school program taken and the measures of school experience.

Findings

Achievement measures vs. voc-oriented or general	X^2	d.f.	p	Sig.	Table No.
Class rank	8.365	5	$.25 > p > .10$	No	14
English average	5.083	5	$.50 > p > .25$	No	15
Attendance	0.873	5	$.975 > p > .95$	No	16

The null hypotheses of no significant relationships were accepted.

Tables 14, 15, and 16 illustrate the frequencies by which the tests were computed. No test was made in regard to grade average in vocationally-oriented courses because no average was obtained for the general graduates in these courses.

Interpretation

The findings tend to support the supposition that the general and vocationally-oriented graduates in this study, selected on the defined criteria, do not differ appreciably, as groups, on either the high school class rank or the average of letter grades in six semesters of English. The borderline finding for class rank suggests that the higher grade averages which the vocationally-oriented group tended to receive in vocationally-oriented courses were affecting their class ranks in their favor. (Compare Tables 10 and 12, in Chapter III.) But since the general group had no vocationally-oriented course average this could not be tested directly. The attendance factor is very clearly a non-relationship. (Attendance, in other contexts, tends to be less consistent with other measures.)

Comparing schools on jobs obtained by graduates

If neither schools nor school programs differ on the achievement measures (as it appeared at this point in the study--pertaining to the subjects of the study), a related question was: Do the graduates of any of the schools fare better than the others in obtaining jobs which are related to the vocationally-oriented training received in high school?

Table 13 illustrated the proportions of vocationally-oriented graduates from the three schools who obtained jobs related to the training received. A test was conducted and is reported below

TABLE 14

OBSERVED FREQUENCIES USED IN TESTING THE RELATIONSHIP BETWEEN HIGH SCHOOL PROGRAM AND CLASS RANK AT GRADUATION

Class Rank (in "stens")	School Program Emphasized: Vocationally-Oriented	School Program Emphasized: General
8	13	9
7	15	9
6	25	3
5	24	8
4	15	5
3	20	5
	112	38
$X^2 = 8.365$	d.f. = 5	$.25 > p > .10$

TABLE 15

OBSERVED FREQUENCIES USED IN TESTING THE RELATIONSHIP BETWEEN HIGH SCHOOL PROGRAM AND GRADE AVERAGE IN ENGLISH COURSES

English Average (in "stens")	School Program Emphasized: Vocationally-Oriented	School Program Emphasized: General
8	17	11
7	16	5
6	21	5
5	23	8
4	20	7
3	15	2
	112	38
$X^2 = 5.083$	d.f. = 5	$.75 > p > .50$

TABLE 16

OBSERVED FREQUENCIES USED IN TESTING THE RELATIONSHIP BETWEEN HIGH SCHOOL PROGRAM AND RECORD OF SCHOOL ATTENDANCE

Attendance (in "stens")	School Program Emphasized: Vocationally-Oriented	School Program Emphasized: General
8	19	5
7	13	6
6	24	7
5	20	7
4	18	6
3	18	7
	112	38
$X^2 = 0.873$	d.f. = 5	$.975 > p > .95$

concerning whether or not the proportion in related jobs compared to those in non-related jobs represents a statistically significant relationship. This information had some bearing on how subsequent findings were interpreted.

The null hypothesis was that there is no significant relationship between the jobs-training classification and the school attended.

<u>Finding</u> re <u>school attended</u> and <u>jobs related or not to training</u>

$X^2 = 1.953$ d.f. = 2 $.50 > p > .25$

The null hypothesis of no significant relationship was accepted.

Table 17 illustrates the observed frequencies associated with the above finding.

TABLE 17

OBSERVED FREQUENCIES USED IN TESTING THE RELATIONSHIP BETWEEN VOCATIONALLY-ORIENTED GRADUATES CLASSIFIED BY RELATEDNESS OF JOBS TO TRAINING RECEIVED AND HIGH SCHOOL ATTENDED

School	Vocationally-oriented graduates	
	Jobs related to training received	Jobs not related to training
Urban Vocational	29	26
Urban Comprehensive	15	20
Suburban Comprehensive	8	14
$X^2 = 1.953$	d.f. = 2	$.50 > p > .25$

Interpretation

The finding tends to support the supposition that the school attended does not appreciably affect the process of obtaining jobs related to training received. Slight irregularities between observed and expected frequencies in cells of the chi-square table favor the urban vocational school. (The availability of more extensive job placement facilities in the vocational high school would lead one to expect some advantage in placement.) This finding also tends to reinforce the basic assumption of the similarity of the school-groups.

Relationship between the two job-definition dimensions

Figure 1 (in Chapter III) provided the framework for classifying all jobs by assigning six possible rank orders (of importance to the employer) to the job-content factors, plus four levels of demandingness of the jobs. The result was a grid with 24 cells, each comprising a job definition based on two major dimensions of all jobs. If numbers of subjects had been greater, chi-square tests based on 24 cells could have been made.

It can be seen in Table 18 that if a chi-square test were made too many cells in the expected frequency table would contain frequencies of less than 5. Therefore, no tests were made using data distributed as shown in Table 18. Instead, it was necessary to group the two types of jobs where the employer ranked "Communications Competency" as first in importance. This caused the distinction to be lost between

jobs where the order of factor-importance could be symbolized as CPS and CSP. These both became jobs where the "C" factor was emphasized. The same operation was performed for jobs where the order of factor-importance was SCP and SPC. These both became jobs where the "S" factor was emphasized, for "Skills Unique to the Job." The numbers of jobs where the order of factor-importance was PCS and PSC were large enough to preserve their identities. The symbols, however, were shortened to "Pc" and "Ps," denoting the major emphases as "Personal Adequacy" first in both instances, and "Communications..." or "Skills..." second, respectively.

Finding re job-content vs. demandingness

$X^2 = 43.479$ d.f. = 6 $p < .001$

The null hypothesis that there was no significant relationship between the job-content emphasis and the demandingness was rejected.

Table 18 follows the structure of Figure 1 in registering the frequencies for the 24 cells.

Table 19 registers the frequencies of the two-dimensional job-definitions after the cells had been reduced from 24 to 12.

TABLE 18

OBSERVED FREQUENCIES OF 150 ENTRY-JOBS DEFINED BY SIX JOB-CONTENT EMPHASES AND FOUR LEVELS OF DEMANDINGNESS

Levels of Demandingness	Sequences of Importance of Content Factors					
	CPS	CSP	PCS	PSC	SCP	SPC
4 (more)	3	2	1	2	5	2
3	13	1	11	2	1	2
2	19	2	25	12	3	2
1 (less)	2	--	13	25	--	2
	37	5	50	41	9	8

TABLE 19

OBSERVED FREQUENCIES OF 150 ENTRY-JOBS DEFINED BY FOUR JOB-CONTENT EMPHASES AND THREE LEVELS OF DEMANDINGNESS

Levels of Demandingness	Job Content Emphases			
	C	Pc	Ps	S
3 (more)	19	12	4	10
2	21	25	12	5
1 (less)	2	13	25	2
	42	50	41	17

$X^2 = 43.479$ d.f. = 6 $p < .001$

Interpretation

The jobs where "Communications Competency" and "Skills Unique to the Job" were ranked first in importance by employers tended to be the average and more-demanding jobs, as demandingness was defined and scaled in the study. The least-demanding jobs, on the other hand, tended distinctly to be the jobs where "Personal Adequacy" was ranked first in importance with "Skills Unique to the Job" ranked second. Jobs which were characterized as those with "Personal Adequacy" ranked first and "Communications Competency" second tended to be average in demandingness. These tendencies may provide some clues for further study of curriculum needs for the types of boys who tend to obtain certain types of jobs after graduation.

Relationship between two evaluations of satisfactoriness

The last in the series of preliminary tests concerned the relationship between the ranking on "Overall Satisfactoriness" and the rating as "Satisfactory" or "Unsatisfactory."

A chi-square test is reported in Table 20, but is meaningless because the definition of the procedure for determining the "Satisfactory"-"Unsatisfactory" rating determined that all "Unsatisfactory" workers would be low-ranked. However, the table is presented to appraise the frequency with which lowest-ranked workers were nevertheless "Satisfactory" and also the frequency with which "Unsatis-

factory" workers were nevertheless ranked higher than the lowest in the group. Of most importance, it was desired that the proportion who had worked 90 days or more but had not been fired be determined.

TABLE 20

EMPLOYERS' RATINGS OF "SATISFACTORY" AND "UNSATISFACTORY" AND RANKINGS ON "OVERALL SATISFACTORINESS"

Entry-job Rank (score) on "Overall Satisfactoriness"	Employer's Rating	
	Satisfactory	Unsatisfactory
7 (higher)	24	1
6	43	--
5	30	5
4 (lower)	10	36
	107	42
$X^2 = 84.423$	d.f. = 3	$p < .001$

Interpretation

The most important information provided by Table 20 is that 42 subjects--almost one-third--were considered to be "Unsatisfactory" by their employers even though they had passed the usual probationary period and had not been fired. (A few of these were fired after four or more months, it was learned in the interviews.)

Thirty-six of the 42 "Unsatisfactory" subjects had the lowest standardized score which was given. Five more were probably workers in groups where more than the lowest-ranked member were "Unsatisfactory." Among the "Satisfactory" subjects, ten received the lowest ranking, but these were probably members of groups where the employer considered all members, at least all of the principal subjects, to be "Satisfactory."

Two peculiarities of the distributions of rank-scores, which may be seen in several tables, should be noted in connection with this first table in which they appear. If the co-worker groups had included some with eight or more workers to be ranked, the

range of scores would have been from 3 to 8. But the maximum size was six. It may be noted that greater proportions appear in connection with scores of 4 and 6. This is a result of moving scores to the lower alternative when they fell at midpoints and when the cluster had an "Unsatisfactory" worker. Also, the 4's appeared to be assigned more heavily to the principal subjects with the necessary implication that co-workers were assigned the 7's in unexpectedly large numbers.

Relationships Between School Achievement or Programs and Job Definitions

(I)*

The findings reported in this first of three major sets of relationships involve tests of relationships between (1) school background (the achievement measures and the program emphasized) and (2) the jobs (defined by relative importance of the three content areas plus the designated levels of demandingness).

The present section (I) features comparisons of the sub-sets of specific relationships between (1) the achievement measures or programs taken and (2) the jobs as defined by content and/or demandingness. The purpose is to report information concerning tendencies for graduates with certain types of school background to obtain certain types of jobs.

Specific null hypotheses were implied for the several pairs of specific variables tested. This breakdown is indicated by the outline which follows, in which the statistical findings of the chi-square tests of significant relationships are reported.

---

*All tables which pertain to the tests of relationships reported in the sections headed (I), (II), and (III) appear in Appendix A, including duplicates of those which appear in the context of these sections. Tables which have appeared previous to this notation are not duplicated in Appendix A.

a) Findings re <u>school achievement</u> vs. <u>job content</u>

(1) Class rank
vs. job content:

Null hypothesis accepted; $X^2 = 19.260$ d.f. = 15
$.25 > p > .10$ (Table 21)

(2) English grade average
vs. job content:

Null hypothesis accepted; $X^2 = 20.892$ d.f. = 15
$.25 > p > .10$ (Table 22)

(3) Vocationally-oriented average
vs. job content:

Null hypothesis accepted; $X^2 = 8.043$ d.f. = 15
$.95 > p > .90$ (Table 5A)

(4) Attendance record
vs. job content:

Null hypothesis accepted; $X^2 = 11.586$ d.f. = 15
$.75 > p > .50$ (Table 6A)

<u>Interpretation</u>

None of the measures of school achievement were related significantly to the job-content factor of the job definition. This apparently means that each type of job (regarding content) has workers who are distributed widely on each of the achievement measures. The irregularity of the observed frequencies which made the probability approach .10 on the class rank and English comparisons was that a few more subjects had jobs emphasizing "Communications Competency," along with higher grades.

A less conservative interpretation of significance levels might have allowed an interpretation that the higher achievers in the academic areas tend to get jobs where "Communications Competency" is valued most, and that having a good attendance record has no observable relationship to the job-content emphasis. The highest achievers in vocationally-oriented courses also appear to have more jobs where "Skills..." were valued most, but the frequencies in the "Skills..." column are too small to affect the chi-square outcome very much.

Tables 21 and 22 illustrate the findings related to the first and second tests under a), above, from which some clues may be obtained for seeking relationships, perhaps through use of more sensitive instruments which might be developed.

TABLE 21

OBSERVED FREQUENCIES USED IN TESTING THE RELATIONSHIP BETWEEN HIGH SCHOOL CLASS RANK AND JOB CONTENT EMPHASIS

Class Rank (in "stens")	Job Content Emphasis			
	C	Pc	Ps	S
8	10	7	2	3
7	8	7	7	2
6	11	11	4	2
5	6	8	12	5
4	4	9	6	1
3	3	8	10	4
	42	50	41	17

$X^2 = 19.260$ d.f. = 15 $.25 > p > .10$

TABLE 22

OBSERVED FREQUENCIES USED IN TESTING THE RELATIONSHIP BETWEEN HIGH SCHOOL GRADE AVERAGE IN ENGLISH AND JOB CONTENT EMPHASIS

English Average (in "stens")	Job Content Emphasis			
	C	Pc	Ps	S
8	11	10	3	4
7	8	5	4	4
6	5	7	10	4
5	10	11	9	1
4	6	13	6	2
3	2	4	9	2
	42	50	41	17

$X^2 = 20.892$ d.f. = 15 $.25 > p > .10$

b) Findings re <u>school achievement</u> vs. <u>demandingness</u>

(1) Class rank
vs. demandingness:

Null hypothesis <u>rejected</u>; $X^2 = 28.556$ d.f. = 10
$p < .005$ (Table 23)

(2) English grade average
vs. demandingness:

Null hypothesis <u>rejected</u>; $X^2 = 27.577$ d.f. = 10
$p < .005$ (Table 24)

(3) Vocationally-oriented average
vs. demandingness:

Null hypothesis <u>rejected</u>; $X^2 = 20.972$ d.f. = 10
$p < .025$ (Table 9A)

(4) Attendance record
vs. demandingness:

Null hypothesis accepted; $X^2 = 9.265$ d.f. = 10
$.75 > p > .50$ (Table 10A)

<u>Interpretation</u>

The findings tended to support the supposition that the more-demanding jobs tended to be obtained by graduates who had achieved the higher class ranks and higher grade averages in English.

Grade average in vocationally-oriented courses also had, in these findings, a significant positive relationship to job demandingness.

The attendance record showed no significant relationship to the demandingness of jobs. (Apparently the employers associated with the more-demanding jobs made no greater effort to check school attendance records than did the employers for the less-demanding jobs.)

Tables 23 and 24 illustrate the findings related to the first two tests under b), above, which produced the most distinct results.

TABLE 23

OBSERVED FREQUENCIES USED IN TESTING THE RELATIONSHIP BETWEEN HIGH SCHOOL CLASS RANK AND DEMANDINGNESS LEVEL OF ENTRY-JOB

Class rank (in "stens")	Demandingness of Job (less) 1	2	(more) 3
8	3	5	14
7	3	12	9
6	4	16	8
5	11	14	6
4	10	7	3
3	11	9	5
	42	63	45

$X^2 = 28.556$ d.f. = 10 $p < .005$

TABLE 24

OBSERVED FREQUENCIES USED IN TESTING THE RELATIONSHIP BETWEEN HIGH SCHOOL GRADE AVERAGE IN ENGLISH AND DEMANDINGNESS LEVEL OF ENTRY-JOB

English Average (in "stens")	Demandingness of Job (less) 1	2	(more) 3
8	4	9	15
7	4	6	11
6	8	9	9
5	10	16	5
4	7	15	5
3	9	8	--
	42	63	45

$X^2 = 27.577$ d.f. = 10 $p < .005$

c) Findings re school program vs. job content

(1) General or vocationally-oriented program vs. job content:

Null hypothesis accepted; $X^2 = 4.228$ d.f. = 3
$.50 > p > .25$ (Table 25)

(2) Vocationally-oriented graduates classified by relatedness of job to training received vs. job content:

Null hypothesis rejected; $X^2 = 12.336$ d.f. = 3
$p > .01$ (Table 26)

Interpretation

There were no significant differences between the general graduates and the vocationally-oriented graduates, as groups, as to whether employers placed greater value on the factors of Communications Competency, Personal Adequacy, or Skills Unique to the Job.

However, in comparing the vocationally-oriented graduates who had obtained jobs related to training received and those without jobs related to training, significant relationships were registered. The differences concentrated in two of the four job-types: In the jobs where the "Skills..." factor was valued most, the observed frequency of having a job related to training was almost twice that expected by chance, as seen in Table 26. In "Pc" jobs, where "Personal Adequacy" was valued most and "Communications Competency" second, the observed frequency of having a job related to training was 25, compared to an expected frequency of 18.

Tables 25 and 26 illustrate the findings concerning school program vs. job content.

TABLE 25

OBSERVED FREQUENCIES USED IN TESTING THE RELATIONSHIP BETWEEN HIGH SCHOOL PROGRAM EMPHASIZED AND JOB-CONTENT EMPHASIS

Job-Content Emphasis	Vocationally-Oriented	General Education
C	30	12
Pc	35	15
Ps	31	10
S	16	1
	112	38
$X^2 = 4.228$	d.f. = 3	$.50 > p > .25$

TABLE 26

OBSERVED FREQUENCIES USED IN TESTING THE RELATIONSHIP BETWEEN VOCATIONALLY-ORIENTED GRADUATES CLASSIFIED BY RELATEDNESS OF JOBS TO TRAINING RECEIVED AND JOB-CONTENT EMPHASIS

Job-Content Emphasis	Vocationally-oriented graduates	
	Job related to training received	Jobs not related to training
C	14	16
Pc	10	25
Ps	15	16
S	13	3
	52	60
$X^2 = 12.337$	d.f. = 3	$p < .01$

d) Findings re school program vs. demandingness

(1) General or vocationally-oriented program vs. demandingness of jobs:

Null hypothesis accepted; $X^2 = .337$ d.f. = 2
$.99 > p > .98$ (Table 13A)

(2) Vocationally-oriented graduates classified by relatedness of job to training received vs. demandingness of jobs:

Null hypothesis rejected; $X^2 = 17.205$ d.f. = 2
$p < .001$ (Table 14A)

Interpretation

The general and vocationally-oriented groups were not found to be appreciably different in distributions of the demandingness factor of the jobs. However, a distinct difference registered between sub-groups of the vocationally-oriented classification; those who had jobs which were related to school training received tended to be in the more-demanding jobs, and vice-versa.

e) Relationships between vocationally-oriented graduates classified by relatedness of job to training received and the school achievement measures

(1) Vocationally-oriented graduates classified by relatedness of job to training received vs. class rank:

Rejection of the null hypothesis remains in doubt;
$X^2 = 10.706$ d.f. = 5
$.10 > p > .05$ (Table 15A)

(2) Vocationally-oriented graduates classified by relatedness of job to training received vs. grade average in English:

Null hypothesis accepted; $X^2 = 2.603$ d.f. = 5
$.90 > p > .75$ (Table 16A)

(3) Vocationally-oriented graduates classified by relatedness of job to training received vs. grade average in vocationally-oriented courses:

Null hypothesis rejected; $X^2 = 15.182$ d.f. = 5 (Table 27)
$p < .01$

(4) Vocationally-oriented graduates classified by relatedness of job to training received vs. attendance record:

Null hypothesis accepted; $X^2 = 1.241$ d.f. = 5 (Table 18A)
$.95 > p > .90$

Table 27 illustrates the findings pertaining to test (3) above.

TABLE 27

OBSERVED FREQUENCIES USED IN TESTING THE RELATIONSHIP BETWEEN VOCATIONALLY-ORIENTED GRADUATES CLASSIFIED BY RELATEDNESS OF JOBS TO TRAINING RECEIVED AND HIGH SCHOOL GRADE AVERAGE IN VOCATIONALLY-ORIENTED COURSES

Voc-Oriented Average (in "stens")	Vocationally-oriented graduates: Jobs related to training received	Vocationally-oriented graduates: Jobs not related to training
8	11	6
7	14	4
6	8	15
5	9	10
4	6	14
3	4	11
	52	60
$X^2 = 15.181$	d.f. = 5	$p < .01$

Interpretation

It is clear that having higher grades in vocationally-oriented courses is positively related to having a job which is related to training received in high school (test 3). Therefore, doing well

in vocationally-oriented courses seems to help predict getting a related job.

On the other hand, English grades (test 2) have no appreciable relationship to getting a job related to training, and the dubious relationship with class rank (test 1) is very likely a reflection of the relationship with vocationally-oriented courses, as these courses make up one-fourth to one-half of the total courses which result in the class rank.

Relationships Between the Job Definitions and the Evaluations of Satisfactoriness (II)

The findings reported in this second of three major sets of relationships tested involve relationships between (1) the jobs, as defined by content and demandingness and (2) the employers' evaluations, that is, rankings of employee satisfactoriness on the job-content emphases plus the rating as "Satisfactory" or "Unsatisfactory."

No broad hypothesis was involved in conducting the second set of tests. The chief purpose was to set the stage for better interpretation of the relationships in the third set--which concerns achievement and program vs. rankings and ratings of satisfactoriness. This objective was achieved in two parts.

First, the tests of relationships between (1) job-content or demandingness and (2) rankings on satisfactoriness were in a sense a validity test--of whether the 150 principal subjects were representative of all workers ranked. This occurred because every cluster of workers had to be assigned approximately the same distribution of rank (scores), in that ranking and then transforming ranks to standard scores implies this. The only factor other than chance which could have caused significant relationships to show up in this situation was the possibility that some types of jobs, of certain content or demandingness designations, could have significant numbers of co-workers who were unlike the principal subjects in ways associated with the selective criteria. For example, if the most-demanding jobs, or the jobs for which employers valued the "Skills..." factor most, had significantly more than the

expected proportions of the 150 principal subjects ranked lowest or highest, this would have registered in the form of significant chi-square findings.

Second, tests of relationships between (1) job-content or demandingness and (2) the rating of "Satisfactory" or "Unsatisfactory" were conducted to discover if significantly different proportions of employers associated with the various types of jobs tended to be satisfied or dissatisfied with their lower-ranked workers. For example, it is conceivable that the most-demanding jobs in which "Skills..." are valued most could tend to be filled by a quality of worker unsuited to satisfactory performance--compared to other job definitions.

Each test indicated in the outline which follows was based on the null hypothesis that there are no significant relationships between the variables.

a) Findings re <u>job content</u> vs. <u>satisfactoriness</u> rankings

(1) Job-content vs. rank on Communications Competency:

Null hypothesis accepted; $X^2 = 9.864$ d.f. = 9
$.50 > p > .25$ (Table 19A)

(2) Job-content vs. rank on Personal Adequacy:

Null hypothesis accepted; $X^2 = 7.365$ d.f. = 9
$.75 > p > .50$ (Table 20A)

(3) Job-content vs. rank on Skills Unique to the Job:

Null hypothesis accepted; $X^2 = 7.537$ d.f. = 9
$.75 > p > .50$ (Table 28)

(4) Jcb-content vs. rank on Overall Satisfactoriness:

Null hypothesis accepted; $X^2 = 6.531$ d.f. = 9
$.75 > p > .50$ (Table 22A)

<u>Interpretation</u>

The findings do <u>not</u> support a supposition that certain types of jobs had a greater than average proportion of workers filling them who could not meet a "Satisfactory" standard. This finding

relates to a specific objective of the study, which was to discover if jobs emphasizing industrial skills might not tend to recruit more than their share of low-ability people, mainly because of greater specific efforts made by schools to train and place these people, compared with the jobs where "Communications Competency" or "Personal Adequacy" is valued most.

The lack of support for the above supposition does not mean the tendency noted may not exist in some degree. The investigator became aware during the interviews with employers that a few subjects who had less-demanding jobs were subjects who had been vocationally-oriented and had initially obtained jobs which were of high-demandingness and which were related to training received. They had been dismissed from these jobs after one or two months and then obtained the less-demanding jobs which were not related to training received.

To arrive at a more conclusive outcome on this question would require a sample containing a larger number of the more-demanding jobs which stress the "Skills..." factor (only 10 jobs of this description appear in Table 19), so that this particular group could be separately analyzed in regard to aptitudes, school achievement, and evaluations of satisfactoriness. Jobs from which workers had been fired before 90 days would also have to be taken into account.

Table 28, pertaining to ranks on the "Skills..." factor is presented below to illustrate the series of tests under section a).

TABLE 28

OBSERVED FREQUENCIES USED IN TESTING THE RELATIONSHIP BETWEEN JOB-CONTENT EMPHASIS AND RANK ON "SKILLS UNIQUE TO THE JOB"

Rank (score) on "Skills Unique to the Job"	Job-content emphasis			
	C	Pc	Ps	S
7	8	14	5	5
6	11	10	13	4
5	11	12	15	3
4	12	14	8	5
	42	50	41	17

$X^2 = 7.537$ d.f. = 9 $.75 > p > .50$

b) Findings re demandingness of jobs vs. satisfactoriness rankings

(1) Demandingness vs. rank on Communications Competency:

Null hypothesis accepted; $X^2 = 5.015$ d.f. = 6
$.75 > p > .50$ (Table 23A)

(2) Demandingness vs. rank on Personal Adequacy:

Null hypothesis accepted; $X^2 = 7.067$ d.f. = 6
$.50 > p > .25$ (Table 24A)

(3) Demandingness vs. rank on Skills Unique to the Job:

Null hypothesis accepted; $X^2 = 8.615$ d.f. = 6
$.25 > p > .10$ (Table 29)

(4) Demandingness vs. rank on Overall Satisfactoriness:

Null hypothesis accepted; $X^2 = 7.148$ d.f. = 6
$.50 > p > .25$ (Table 26A)

Interpretation

The findings tended to support the supposition that the harder and easier jobs involve approximately equal proportions of workers who are ranked higher or lower on each of the evaluative criteria. Some irregularities between observed and expected frequencies were noted at the extremes--fewer were ranked lowest in the easiest jobs and more were ranked highest in the harder jobs. They deserve mention because they are consistent in direction.

Table 29 presents the frequencies observed in the third test, pertaining to ranks on the "Skills..." factor, on which some irregularities may be seen.

TABLE 29

OBSERVED FREQUENCIES USED IN TESTING THE RELATIONSHIP BETWEEN DEMANDINGNESS OF JOB AND RANK ON "SKILLS UNIQUE TO THE JOB"

Rank (score) on "Skills Unique to the Job"	Demandingness of Job (less) 1	2	(more) 3
7	7	11	14
6	16	15	7
5	11	18	12
4	8	19	12
	42	63	45

$X^2 = 8.615$ d.f. = 6 $.25 > p > .10$

c) Findings re rating as Satisfactory or Unsatisfactory vs. job-content

Null hypothesis accepted; $X^2 = 2.818$ d.f. = 3
$.50 > p > .25$ (Table 30)

Interpretation

The findings tended to support the supposition that there is no relationship between the type of job (by content) and whether or not the employer will rate larger or smaller proportions of workers as "Unsatisfactory." Apparently, the proportions of easily satisfied and less-easily satisfied supervisors occur equally among the "Communications..." jobs (e.g., shipping clerks), the "Personal Adequacy" jobs (customer and co-worker relations), and the "Skills..." jobs (the product matters most).

Table 30 illustrates the frequencies which pertain to the above interpretation.

TABLE 30

OBSERVED FREQUENCIES USED IN TESTING THE RELATIONSHIP BETWEEN JOB-CONTENT EMPHASIS AND RATING AS "SATISFACTORY" OR "UNSATISFACTORY"

Entry-Job Rating	Job-Content Emphasis			
	C	Pc	Ps	S
Satisfactory	29	38	26	14
Unsatisfactory	12	12	15	3
	41	50	41	17

$X^2 = 2.818$ d.f. = 3 $.50 > p > .25$

d) Findings re rating as Satisfactory or Unsatisfactory vs. demandingness of jobs

Null hypothesis accepted; $X^2 = 4.413$ d.f. = 2
$.25 > p > .10$ (Table 31)

Interpretation

As in the case of job content, the easily satisfied or less-easily satisfied supervisor seems to appear in about equal frequency in all levels of demandingness of jobs. Some irregularity of frequencies occurred in that the supervisors of the more-demanding jobs rated fewer workers "Unsatisfactory" than would likely have happened by chance. A separate analysis of the "more-demanding" classification would probably reveal a significant relationship. A reasonable explanation might be that the "more-demanding" jobs were those where "Unsatisfactory" performance could not be tolerated as readily as it seems was the case in regard to the jobs of average and lower demandingness.

Table 31 illustrates the pattern of frequencies which pertains to the interpretation of demandingness vs. "Satisfactory"-"Unsatisfactory."

TABLE 31

OBSERVED FREQUENCIES USED IN TESTING THE RELATIONSHIP BETWEEN DEMANDINGNESS OF JOB AND RATING AS "SATISFACTORY" OR "UNSATISFACTORY"

Entry-Job Rating	Demandingness of Job (less) 1	2	(more) 3
Satisfactory	31	40	36
Unsatisfactory	11	23	8
	42	63	44

$X^2 = 4.413$ d.f. = 2 $.25 > p > .10$

Relationships Between School Achievement and Programs and the Evaluations of Satisfactoriness

(III)

The findings reported in this last of three major sets of relationships tested focus most directly on the central objective of the study: exploring the relationships between school achievement measures of type of program taken and the rankings and ratings of satisfactoriness of workers by their employers.

The broad hypothesis which is examined in this set of tests is that relationships exist between (1) school achievement and programs taken, and (2) the satisfactoriness of performance on post-school jobs--as evaluated by employers. These relationships are thought to be potentially useful for prediction of success in employment, but it is not proposed that these are cause-effect relationships.[1]

---

[1]The introductory section of Chapter III includes some possible explanations for why these relationships may be difficult to discern. Even where relationships are found in these tests, it is assumed that several factors are operating to make the "true" conditions unknowable except for the surface indications revealed in tests such as those reported in this volume.

Programs and satisfactoriness

In the following sequence of findings and interpretations, relationships between programs and satisfactoriness are presented first (a and b, below). Figure 6 illustrates the relationships tested which involved the programs taken.

FIGURE 6

THE RELATIONSHIP BETWEEN THE SCHOOL PROGRAM AND JOB OBTAINED AND THE EMPLOYER EVALUATION OF SATISFACTORINESS

		School Program			
		Vocationally-Oriented			General Education
		Jobs Related to Training	Jobs Not Related	Total	
Rank (score) on Content Factors	7				
	6				
	5				
	4				
Rating	S				
	U				

The broad hypothesis is represented by implied specific null hypotheses for the several pairs tested. This breakdown is indicated by the outline which follows, in which the statistical findings of the chi-square tests of significant differences are reported.

---

*These scores are similar to "sten" values in that the median is 5.5 and the distribution is estimated from a normal distribution. See Tsble 2A, in Appendix A, for a further explanation of the scoring process.

a) Findings re <u>school program</u> and <u>satisfactoriness rank</u>

(1) General or vocationally-oriented program vs. rank on Communications Competency:

Null hypothesis accepted; $X^2 = 3.985$ d.f. = 3
$.50 > p > .25$ (Table 29A)

(2) General or vocationally-oriented program vs. rank on Personal Adequacy:

Null hypothesis accepted; $X^2 = 2.179$ d.f. = 3
$.75 > p > .50$ (Table 30A)

(3) General or vocationally-oriented program vs. rank on Skills Unique to the Job:

Null hypothesis accepted; $X^2 = 0.107$ d.f. = 3
$.995 > p > .99$ (Table 32)

(4) General or vocationally-oriented program vs. rank on Overall Satisfactoriness:

Null hypothesis accepted; $X^2 = 3.981$ d.f. = 3
$.50 > p > .25$ (Table 32A)

(5) Vocationally-oriented graduates classified by relatedness of job to training received vs. rank on Skills Unique to the Job:

Null hypothesis accepted; $X^2 = 0.978$ d.f. = 3
$.90 > p > .75$ (Table 33A)

(6) Vocationally-oriented graduates classified by relatedness of job to training received vs. rank on Overall Satisfactoriness:

Null hypothesis accepted; $X^2 = 1.969$ d.f. = 3
$.75 > p > .50$ (Table 34A)

Interpretation

None of the above tests of relationships resulted in probability values at the level of significance. These findings provide no support for a contention that either the general or the vocationally-oriented graduates ranked higher among their co-workers in the jobs that they happened to obtain. This of course does not mean that the result would be the same if the two groups exchanged jobs.

Test (3) may be worthy of special note because of the almost complete absence of irregularity between observed and expected frequencies and also because it focused on the "Skills..." factor, which might be offered as the factor most likely to have produced a difference. Interpretation must take into account the small number of jobs where "Skills..." ranked highest in importance, and also the concept in the preceding paragraph.

Tests (5) and (6) focus on another dimension--that of the vocationally-oriented graduates who did or did not obtain jobs related to the training received in school. It has been determined that the latter group clearly tended to have less-demanding jobs; therefore, it is not unexpected that the employer's evaluations of the latter, on the average, were not significantly different than the evaluations of the job-related group.

Table 32 illustrates test (3), as an example of the pattern of frequencies observed in tests of school program vs. satisfactoriness.

TABLE 32

OBSERVED FREQUENCIES USED IN TESTING THE RELATIONSHIP BETWEEN HIGH SCHOOL PROGRAM EMPHASIZED AND RANK ON "SKILLS UNIQUE TO THE JOB"

Rank (score) on "Skills Unique to the Job"	School Program	
	Vocationally-Oriented	General
7	24	8
6	29	9
5	30	11
4	29	10
	112	38
$X^2 = 0.107$	d.f. = 3	$.995 > p > .99$

b) Findings re school program and rating on Satisfactory or Unsatisfactory

(1) General or vocationally-oriented program vs. Satisfactory or Unsatisfactory:

Rejection of the null hypothesis remains in doubt;
$X^2 = 2.943$ d.f. = 1
$.10 > p > .05$ (Table 33)

(2) Vocationally-oriented graduates classified by relatedness of job to training received vs. Satisfactory or Unsatisfactory:

Null hypothesis accepted; $X^2 = 0.0003$ d.f. = 1
$p < .90$ (Table 36A)

Interpretation

The relationship between the proportion of "Unsatisfactory" workers and the school program taken was not great enough to be termed significant, but the irregularity between observed and expected frequencies favored the vocationally-oriented group. This observation may provide some clues for further study, especially when appraised in connection with test (4) under a), in regard to school program vs. rank on "Overall Satisfactoriness."

It appears that a supposition which may be worth pursuing is that a significantly greater proportion of boys without vocationally-oriented training are rated "Unsatisfactory" because there may be a certain group of graduates in a typical graduating class who are unsuited (through immaturity) to succeed in any full time job, and these boys, who are not "work-oriented," are not likely to have taken a sequence in a vocational field.

Test (2), under b), reinforces the interpretation of findings pertaining to tests (5) and (b), under a), in the preceding section. Apparently, approximately the same proportions of workers in the clusters of co-workers were considered to be "Unsatisfactory" regardless of the relationship of the job to the training received in school.

Table 33 illustrates the frequencies which resulted in the dubious relationship between the school program and the rating as "Satisfactory" or "Unsatisfactory."

TABLE 33

OBSERVED FREQUENCIES USED IN TESTING THE RELATIONSHIP BETWEEN HIGH SCHOOL PROGRAM EMPHASIZED AND RATING AS "SATISFACTORY" OR "UNSATISFACTORY"

Entry-Job Rating	School Program	
	Vocationally-oriented	General
Satisfactory	85	22
Unsatisfactory	27	15
	112	37
$X^2 = 2.943$	d.f. = 1	$.10 > p > .05$

Achievement and satisfactoriness

This final sub-section of the series reports the findings and interpretations on relationships between the school achievement measures and satisfactoriness (c and d in the outline). Figure 7 illustrates the elements which are tested.

FIGURE 7

THE RELATIONSHIP BETWEEN THE SCHOOL ACHIEVEMENT INDICATORS AND THE EMPLOYER EVALUATION OF SATISFACTORINESS

		Indications of Achievement			
		Class Rank	English Ave.	Voc-Or. Ave.	Attendance
Rank (score) on Content Factors	7				
	6				
	5				
	4				
Rating	S				
	U				

The first part of sub-section c) consists of the tests which pertain directly to the major hypothesis of the study, which was that ranked satisfactoriness in groupings of school subjects (letter grade averages) would tend to predict ranked satisfactoriness in clusters of comparable co-workers in entry-jobs. (Attendance record was added as a form of "achievement.")

c) Findings re <u>school achievement</u> and <u>satisfactoriness rankings</u>

(1) Class rank
vs. rank on Communications Competency:

Null hypothesis accepted; $X^2 = 9.024$ d.f. = 15
$.90 > p > .75$ (Table 37A)

(2) Class rank
vs. rank on Personal Adequacy:

Null hypothesis accepted; $X^2 = 9.883$ d.f. = 15
$.90 > p > .75$ (Table 35A)

(3) Class rank
vs. rank on Skills Unique to the Job:

Null hypothesis accepted; $X^2 = 10.351$ d.f. = 15
$.90 > p > .75$ (Table 39A)

(4) Class rank
vs. rank on Overall Satisfactoriness:

Null hypothesis accepted; $X^2 = 9.852$ d.f. = 15
$.90 > p > .75$ (Table 34)

(5) Grade average in required English courses
vs. rank on Communications Competency:

Null hypothesis accepted; $X^2 = 9.650$ d.f. = 15
$.90 > p > .75$ (Table 35)

(6) Grade average in required English courses
vs. rank on Personal Adequacy:

Null hypothesis accepted; $X^2 = 13.118$ d.f. = 15
$.75 > p > .50$ (Table 42A)

(7) Grade average in required English courses vs. rank on Skills Unique to the Job:

Null hypothesis accepted; $X^2 = 17.796$ d.f. = 15
$.50 > p > .25$ (Table 43A)

(8) Grade average in required English courses vs. rank on Overall Satisfactoriness:

Null hypothesis accepted; $X^2 = 14.292$ d.f. = 15
$.75 > p > .50$ (Table 44A)

(9) Grade average in vocationally-oriented courses vs. rank on Communications Competency:

Null hypothesis accepted; $X^2 = 14.548$ d.f. = 15
$.50 > p > .25$ (Table 45A)

(10) Grade average in vocationally-oriented courses vs. rank on Personal Adequacy:

Null hypothesis accepted; $X^2 = 11.995$ d.f. = 15
$.75 > p > .50$ (Table 46A)

(11) Grade average in vocationally-oriented courses vs. rank on Skills Unique to the Job:

Null hypothesis <u>rejected</u>; $X^2 = 26.112$ d.f. = 15
$.05 > p > .02$ (Table 36)

(12) Grade average in vocationally-oriented courses vs. rank on Overall Satisfactoriness:

Null hypothesis accepted; $X^2 = 18.964$ d.f. = 15
$.25 > p > .10$ (Table 48A)

(13) Attendance record vs. rank on Communications Competency:

Null hypothesis <u>rejected</u>; $X^2 = 29.443$ d.f. = 15
$.02 > p > .01$ (Table 49A)

(14) Attendance record
vs. rank on Personal Adequacy:

Null hypothesis <u>rejected</u>; $X^2 = 25.472$ d.f. = 15
$.05 > p > .02$ (Table 37)

(15) Attendance record
vs. rank on Skills Unique to the Job:

Rejection of null hypothesis remains in doubt;
$X^2 = 23.543$ d.f. = 15
$.10 > p > .05$ (Table 51A)

(16) Attendance record
vs. rank on Overall Satisfactoriness

Null hypothesis <u>rejected</u>; $X^2 = 29.705$ d.f. = 15
$.02 > p > .01$ (Table 38)

<u>Interpretation</u>

The findings pertaining to <u>class rank and English provide no support for the hypothesis</u> that ranked satisfactoriness on-the-job might be predicted by school achievement measures in a manner parallel to predicting college success (also a form of "ranked satisfactoriness") from high school class rank. The consistency of the probability values associated with the chi-square statistics lends support to a supposition that no relationship, or a very weak relationship at best, exists.

The above statement applies to tests numbered (1) through (8), in c), above. Certain qualifications might be noted:

a) Some of the tests had less meaning because the job descriptions with "Communications..." and "Skills..." valued most were fewer in number. That is, the rank on the content factors which were valued second and third in importance by the employer tended to be reflections of the first factor, as "halo effect." Thereby, they were also reflected in the "Overall Satisfactoriness" rank. Tests (1), (3), and (7), pertaining to the class rank and English categories, fall into this classification.

b) Tests (4) and (5) were internally the most logically-related among those pertaining to class rank and English. (4) was important because it in itself was a direct test of the major hypothesis of the study. Test (5) was important because almost

one-third of the jobs emphasized "Communications...," and here was shown no apparent connection between what English teachers rewarded and what employers had in mind when they were asked to rank workers on "Communications Competency."

Tables 34 and 35 illustrate the observed frequencies used in tests (4) and (5), above, respectively.

TABLE 34

OBSERVED FREQUENCIES USED IN TESTING THE RELATIONSHIP BETWEEN EMPLOYER'S RANK ON "OVERALL SATISFACTORINESS" AND HIGH SCHOOL CLASS RANK

Class Rank (in "stens")	Rank (score) on "Overall Satisfactoriness" 4	5	6	7
8	4	5	8	5
7	8	5	9	2
6	8	7	5	8
5	12	7	9	3
4	7	5	6	2
3	7	6	7	5
	46	35	44	25

$X^2 = 9.853$ d.f. = 15 $.90 > p > .75$

TABLE 35

OBSERVED FREQUENCIES USED IN TESTING THE RELATIONSHIP BETWEEN EMPLOYER'S RANK ON "COMMUNICATIONS COMPETENCY" AND HIGH SCHOOL GRADE AVERAGE IN ENGLISH COURSES

English Average (in "stens")	Rank (score) on "Communications Competency" 4	5	6	7
8	7	4	10	7
7	5	7	5	4
6	8	7	7	4
5	8	9	10	4
4	10	9	5	3
3	4	5	7	1
	42	41	44	23

$X^2 = 9.650$ d.f. = 15 $.90 > p > .75$

The findings pertaining to prediction of employment satisfactoriness through grade averages in vocationally-oriented courses presented a mixed picture. The findings pertaining to prediction from the attendance record presented a consistent pattern of relationships. Test (11) and tests (13) through (16) provide some support for the major hypothesis that school background can be used to predict ranked satisfactoriness in employment.

Certain interpretations may be appropriate in regard to tests (9) through (16):

a) Tests (9), (13), and (15) were probably influenced by "halo effect" more than they evidenced in dependent relationships, because the numbers of jobs where "Communications..." or "Skills..." were valued most were smaller.

b) Tests (11) and (14) represented the most logically-related pairs of variables pertaining to grades in vocationally-oriented courses and the attendance record. Test (11) was the one indication that a grade average may be found to predict ranked satisfactoriness, through the procedures followed in this study. Test (14) was important because attendance or absenteeism on the job was a prominent part of the definition of "Personal Adequacy."

Table 36 illustrates the observed frequencies associated with test (11), in which a significant relationship was found between grade average in vocationally-oriented courses and the rank on "Skills...," which favored the higher achievers.

TABLE 36

OBSERVED FREQUENCIES USED IN TESTING THE RELATIONSHIP BETWEEN EMPLOYER'S RANK ON "SKILLS UNIQUE TO THE JOB" AND HIGH SCHOOL GRADE AVERAGE IN VOCATIONALLY-ORIENTED COURSES

Voc-Oriented Average (in "stens")	Rank (score) on "Skills Unique to the Job"			
	4	5	6	7
8	5	5	4	4
7	6	1	6	5
6	1	11	7	5
5	6	5	5	4
4	3	7	7	3
3	10	2	1	3
	31	31	30	24

$X^2 = 26.112$ d.f. = 15 $.05 > p > .02$

Table 37 illustrates the frequencies associated with test (14), in which a significant relationship was found between school attendance record and rank on "Personal Adequacy," which favored those with average and better attendance records compared with those who had a combined absence and/or tardy record of 55 to 100+ times in grades 10-12.

TABLE 37

OBSERVED FREQUENCIES USED IN TESTING THE RELATIONSHIP BETWEEN EMPLOYER'S RANK ON "PERSONAL ADEQUACY" AND HIGH SCHOOL ATTENDANCE RECORD

Attendance Record (in "stens")	Rank (score) on "Personal Adequacy"			
	4	5	6	7
8	6	2	14	2
7	10	1	3	5
6	88	44	11	8
5	5	6	11	5
44	6	7	7	44
3	13	22	7	3
	48	22	53	27

$X^2 = 25.472$ d.f. = 15 $.05 > p > .02$

Certain final observations may be appropriate in regard to tests (1) through (16) under c):

a) Tests (2), (6), (10), and (14) involved the Personal Adequacy factor. It is of interest to note that the probability values of each of these and the value for Overall Satisfactoriness which follows each one are in every case very close. The three measures of letter grade achievement showed no relationship in this context.

b) Tests (8), (12), and (16) involved the three special achievement measures compared to Overall Satisfactoriness. Grades in English and vocationally-oriented courses showed no significant relationships with satisfactoriness ranks, which is consistent with the finding for class rank.

c) Attendance is the one "achievement" measure which had significant or near-significant relationships with all four satisfactoriness ranks. Again, it should be noted

that the relationship seems to be caused by the irregularities in observed frequencies involving those with the poorest attendance records and those with the lowest satisfactoriness rankings. Little difference is apparent between those who are average and good in school attendance.

d) Findings re <u>school achievement</u> and <u>Satisfactory</u> or <u>Unsatisfactory</u>

(1) Class rank vs. Satisfactory or Unsatisfactory:

Null hypothesis accepted; $X^2 = 3.591$ d.f. = 5
$.75 > p > .50$ (Table 53A)

(2) Grade average in required English courses vs. Satisfactory or Unsatisfactory:

Null hypothesis accepted; $X^2 = 4.078$ d.f. = 5
$.75 > p > .50$ (Table 54A)

(3) Grade average in vocationally-oriented courses vs. Satisfactory or Unsatisfactory:

Null hypothesis accepted; $X^2 = 8.015$ d.f. = 5
$.25 > p > .10$ (Table 55A)

(4) Attendance record vs. Satisfactory or Unsatisfactory:

Rejection of null hypothesis remains in doubt;
$X^2 = 9.897$ d.f. = 5
$.10 > p > .05$ (Table 39)

<u>Interpretation</u>

The "Satisfactory"-"Unsatisfactory" rating was considered to be somewhat closer to being an "absolute" base of evaluation than were the satisfactoriness rankings. However, they were assumed to have this quality only within each co-worker cluster evaluated, in that standards of who is considered "satisfactory" vary among employers. Any difference in standards according to employers associated with the tested <u>groups</u> does <u>not</u> show up in these findings--if a difference does in fact exist. Tests (1) and (2) above were

consistent with the relationships of class rank and English to ranked satisfactoriness, in that the ratings of "Satisfactory"-"Unsatisfactory" also show no significant relationship. Tests (3) and (4) were also consistent with the tests pertaining to ranks in section c), with the irregularities showing the same tendencies but in less-significant degree.

It is of interest to speculate on an explanation for the "softening" of the forces which may have caused the significant relationships reported in section c) to appear in "weakened" form in section d). The irregularities which caused "near-significance" to occur in tests (3) and (4), in d), above, should not properly be mentioned except that all four tests, (1) through (4), were consistent with the pattern of 16 tests in section c), in that they follow the same order of probability values except that a "regression to the mean," of sorts, appeared to function.

It is possible that the factor of "how hard the boss is to please" was randomly distributed among all the jobs, and that this operated to "weaken" the findings in section c), where the rankings were not influenced by this factor, which then appear in section d) in consistent but "weaker" form.

Tables 38 and 39 illustrate the "weakening," comparing "Overall Satisfactoriness" vs. attendance with "Satisfactory"-"Unsatisfactory" vs. attendance.

TABLE 38

OBSERVED FREQUENCIES USED IN TESTING THE RELATIONSHIP BETWEEN EMPLOYER'S RANK ON "OVERALL SATISFACTORINESS" AND HIGH SCHOOL ATTENDANCE RECORD

	107	42
$X^2 = 9.897$	d.f. = 5	$.10 > p > .05$

Testing for Differences Between Recruitment and Selection Procedures, and Between Co-Workers and Principal Subjects

Comparing recruitment and selection procedures

Results of the interviews with the 150 principal subjects made it apparent that some had been recruited and selected more carefully than others. Those who were recruited through some employment office and had been required to take tests and be recommended by their school, plus those who had to have completed a certain vocational program, were assigned to a "carefully selected" group. Those who were employed on the basis of an interview only, after "walking in," were assigned to a "carelessly selected" group.

The broad null hypothesis was that there were no significant differences between the carefully and carelessly selected groups when tested against a variety of potentially meaningful variables.

The tests conducted, with findings, are presented as follows:

(1) Carefully or carelessly selected
vs. position of person who does the hiring:

Null hypothesis rejected; $X^2 = 7.387$ d.f. = 2
$.05 > p > .02$ (Table 40)

(2) Carefully or carelessly selected
vs. school attended:

Null hypothesis accepted; $X^2 = 1.701$ d.f. = 2
$.50 > p > .25$ (Table 58A)

(3) Carefully or carelessly selected
vs. general or vocationally-oriented program:

Null hypothesis accepted; $X^2 = 0.022$ d.f. = 1
$.90 > p > .75$ (Table 59A)

(4) Carefully or carelessly selected
vs. grade average in required English courses:

Null hypothesis accepted; $X^2 = 3.489$ d.f. = 5
$.75 > p > .50$ (Table 60A)

(5) Carefully or carelessly selected
vs. grade average in vocationally-oriented courses:

Rejection of null hypothesis remains in doubt;
$X^2 = 9.830$ d.f. = 5
$.10 > p > .05$ (Table 41)

(6) Carefully or carelessly selected
vs. high school attendance record:

Null hypothesis accepted; $X^2 = 4.264$ d.f. = 5
$.75 > p > .50$ (Table 62A)

(7) Carefully or carelessly selected
vs. rank on "Overall Satisfactoriness":

Null hypothesis accepted; $X^2 = 0.777$ d.f. = 3
$.90 > p > .75$ (Table 63A)

(8) Carefully or carelessly selected
vs. rating as "Satisfactory" or "Unsatisfactory":

Null hypothesis accepted; $X^2 = 0.001$ d.f. = 1
$p < .90$ (Table 64A)

(9) Carefully or carelessly selected
vs. job content priority sequence:

Null hypothesis accepted; $X^2 = 3.676$ d.f. = 3
$.50 > p > .25$ (Table 65A)

(10) Carefully or carelessly selected
vs. demandingness of jobs:

Null hypothesis rejected; $X^2 = 6.119$ d.f. = 2
$.05 \geq p \geq .02$ (Table 42)

(11) Carefully or carelessly selected
vs. jobs classified into ten categories:

Null hypothesis rejected; $X^2 = 17.043$ d.f. = 9
$.05 > p \geq .02$ (Table 43)

Interpretation

Tests 1-11 lend support to the hypothesis that "carefully selected" workers differ significantly in some respects from "carelessly selected" workers. Test (1) indicates that when someone employed by the owner in a mangerial position did the hiring, the applicant was likely to have been "carefully selected." But when the owner did the hiring, 18 out of 26 workers were "walk ins" who were hired with an interview only. (Table 40)

Test (2) shows no significant differences between schools on selection procedure by employers. Test (3) indicates that as high a proportion of general graduates were employed through either "careful" or "careless" procedures as were the vocationally-oriented graduates.

Tests (4), (5), and (6) indicate that only the grade average in vocationally-oriented courses was positively related to the more "careful" selection procedures. Table 41 illustrates that only the "A" students were almost always in the "carefully selected" classification; little difference was apparent among the "B", "C", and "D"

students. English grades and attendance records, on the other hand, did not seem to have any relationship to the selection procedure.

Tests (7) and (8) produced results which are consistent with findings reported earlier. It is logical that no significant relationships would be found because all ranks and ratings pertain to self-contained groups and a low evaluation would be expected just as readily from a supervisor with "careful" standards of hiring (he will tend to be less easily satisfied) than from a "careless" employer.

Test (9) shows that there are no significant differences among jobs where "communications competency," "personal adequacy," or "skills unique to the job" might be valued most--on the factor of selection procedures. Test (10), however, provides a clear indication, as illustrated by Table 42, that the more-demanding jobs are filled through the "careful" selection procedures and the less-demanding jobs are filled through the "careless" procedures.

Test (11) presents a more detailed view of the relationships which were portrayed in Test (9). The skilled jobs were filled through the "careful" procedures and some of the least skilled jobs, such as machine operators, food handlers, and physical laborers, were filled through the "careless" procedures. (Table 42)

Comparing Co-Workers and Principal Subjects

This final section of findings and interpretations represents a large amount of time and effort in proportion to the results obtained. In order to get the data on 90 co-workers of the 150 principal subjects the following procedures were employed:

a) Results of interviews with the 123 employers were screened, with all names of co-workers listed. Graduating lists from 1962, 1963 and 1964 from more than 30 high schools were read to identify names.

b) Ninty of more than 500 co-workers were identified as those who were within a year in age of the principal subjects and who were graduates of Minneapolis-area high schools. Fourteen high schools were visited to collect the data from school records. Superintendents and principals were contacted by letter beforehand.

c) Chi-square tests of significant differences were computed to compare the co-workers with the principal subjects on I.Q., attendance, the five DAT scales, the rank on "Overall Satisfactoriness," and the rating as "satisfactory" or "Unsatisfactory."

Purpose of comparing co-workers. The intent of the procedure summarized above was to strengthen or weaken the assumption that the groups of principal subjects from the three schools were representative of groups which might be selected in a similar way from most high schools in the metropolitan area. If it could have been shown conclusively that workers from a variety of schools, as a combined group, had aptitude characteristics not significantly different from the principal subjects, the conclusions of the study might have wider implications. Another purpose of the follow-up study was to help determine whether or not a bias had been introduced in the evaluation procedure.

Summary of results. The findings of this comparison with co-workers are of considerable interest, but probably are not worth the effort expended. The chief difficulty was that a distinct bias was introduced, not in the evaluation procedure itself, but in the selection of co-workers by the employers. Apparently, employers did not hesitate to evaluate principal subjects who were "Unsatisfactory," after the investigator had introduced the name into the list to be evaluated, but, when the employers had the responsibility of adding names of present and past co-workers, they seemingly were inclined to name the better workers and to omit the poorest ones. This is evidenced by the inclusion of only four "Unsatisfactory" workers in the co-worker group of 90, while 42 "Unsatisfactory" principal subjects were included in the group of 150.

Findings

The broad null hypothesis tested was that there were no significant differences between principal subjects and co-workers in intelligence, attendance record, the DAT scales, and in ranks and ratings of satisfactoriness. The specific findings were:

(1) Co-workers and principal subjects vs. Intelligence Quotient:

Null hypothesis rejected; $X^2 = 13.692$ d.f. = 5
$.02 > p > .01$ (Table 46)

(2) Co-workers and principal subjects vs. attendance record:

Null hypothesis accepted; $X^2 = 7.408$ d.f. = 5
$.25 > p > .10$ (Table 69A)

(3) Co-workers and principal subjects vs. DAT verbal scale:

Null hypothesis accepted; $X^2 = 3.669$ d.f. = 5
$.75 > p > .50$ (Table 70A)

(4) Co-workers and principal subjects vs. DAT numerical scale:

Rejection of null hypothesis remains in doubt;
$X^2 = 10.414$ d.f. = 5
$.10 > p > .05$ (Table 71A)

(5) Co-workers and principal subjects vs. DAT abstract scale:

Null hypothesis accepted; $X^2 = 8.998$ d.f. = 5
$.25 > p > .10$ (Table 72A)

(6) Co-workers and principal subjects vs. DAT space scale:

Rejection of null hypothesis remains in doubt;
$X^2 = 10.083$ d.f. = 5
$.10 > p > .05$ (Table 73A)

(7) Co-workers and principal subjects vs. DAT mechanical scale:

Null hypothesis accepted; $X^2 = 4.842$ d.f. = 5
$.75 > p > .25$ (Table 74A)

(8) Co-workers and principal subjects vs. rank on "Overall Satisfactoriness":

Null hypothesis rejected; $X^2 = 13.811$ d.f. = 5
$.025 > p > .01$ (Table 45)

(9) Co-workers and principal subjects vs. rating as "Satisfactory" or "Unsatisfactory":

Null hypothesis rejected; $X^2 = 18.896$ d.f. = 1 (Table 44)
$p < .001$

Interpretation

Test (9) confirms the illustration in Table 44--that the employers did not list names of "Unsatisfactory" co-workers, and therefore the bias is pre-determined to affect the other tests. Test (8) is a confirmation of Test (9), and Table 46 indicates that the difference exists chiefly between workers with the lower ranks.

Test (1) reflects largely the cluster of high I.Q. scores at the top of the co-worker distribution, with a sharp drop in numbers immediately below the top level. This could be a chance happening which would never be repeated in replications of the study. Table 45 illustrates the observed frequencies.

TABLE 44

OBSERVED FREQUENCIES USED IN TESTING THE RELATIONSHIPS BETWEEN CO-WORKERS AND PRINCIPAL SUBJECTS AND RATING AS "SATISFACTORY" OR "UNSATISFACTORY"

Job Success Rating	Co-Workers	Principal Subjects
Satisfactory	81	107
Unsatisfactory	4	42
	85	149
$X^2 = 18.896$	d.f. = 1	$p < .001$

OBSERVED FREQUENCIES USED IN TESTING THE RELATIONSHIPS BETWEEN CO-WORKERS AND PRINCIPAL SUBJECTS AND RANK ON "OVERALL SATISFACTORINESS"

Rank (score) in work group	Co-Worker	Principal Subjects
8	5	2
7	19	23
6	34	44
5	16	35
4	10	41
3	2	5
	86	150
$X^2 = 13.811$	d.f. = 5	.02 > p > .01"

TABLE 46

OBSERVED FREQUENCIES USED IN TESTING THE RELATIONSHIPS BETWEEN CO-WORKERS AND PRINCIPAL SUBJECTS AND INTELLIGENCE QUOTIENT

I.Q. (in "stens")	Co-Workers	Principal Subjects
8	33	24
7	9	20
6	9	28
5	13	27
4	11	21
3	14	21
	89	141
$X^2 = 13.692$	d.f. = 5	.02 > p > .01

Test (2) indicates that attendance is probably not a related factor in this context, even though it evidenced more pronounced relationships in other contexts than did any other factor.

Tests (3) through (5) are probably reflections of the I.Q. pattern, in some measure. The verbal, numerical, and abstract scales produced a cluster at the top of the co-worker scores, although the probability values did not indicate the same likelihood of significance. Test (6) remains in doubt, and Test (7) shows no relationship.

Because of the bias shown by employers in naming co-workers, it can be speculated that this bias accounts for the deviations from non-significance of relationships. Thus it is possible to reason that the schools from which principal subjects were drawn are fairly representative of most schools in the area, even though the demonstration of this point was disappointingly inconsistent.

Combined Interpretations of Findings

The values which might be derived from an appraisal of findings of this study could more likely be acquired from the detailed interpretations and accompanying tables than from summaries of findings. This observation is based on the nature of pilot studies plus the selected nature of the subjects of this study. No actual conclusions can properly be made from the findings, and the insights which may properly be acquired are restricted to groups of subjects selected by similar criteria and not to entire graduating classes.

Allowing for the above conditions, the questions and answers which follow are offered to assist in synthesizing the contents of Chapter IV.

a) Were the selected subjects alike from school to school?

The following tautological statement represents a procedure which was executed in the study reported in this volume: When selective criteria are devised to exclude high school graduates of types who tend to make entire graduating classes different from one another, those who meet the criteria will form distributions by schools which are not significantly different from school to school. The result of this procedure was that three similar school-groups were formed, based on data gathered from three senior high schools which were dissimilar in many ways. Similarity of selected groups was demonstrated on measures of intelligence, attendance, and four out of five scales of the Differential Aptitude Tests. (The foregoing was reported in Chapter III.) It was also determined that the vocationally-oriented graduates from the three schools did not differ significantly in regard to obtaining jobs related to their school training.

b) Were the general and vocationally-oriented graduates alike?

Because the similarity of the school groups had been demonstrated, at least in large measure, it became possible to equate the proportions from the groups at defined levels of scholastic achievement. This in turn made it possible to discover whether or not the achievement of the general education graduates of combined school-groups was significantly different from the achievement of the vocationally-oriented graduates. It was found that these groups did not differ significantly in class rank or English achievement, and no difference in school attendance record was found.

c) What kinds of jobs were studied?

Testing the two dimensions of the job definition resulted in a clearly significant relationship. The more-demanding jobs tended to be the jobs associated with employers stating that they valued "Communications Competency" or "Skills Unique to the Job" most. The least-demanding jobs tended to be those in which "Personal Adequacy" was valued most, with "Skills Unique to the Job" ranked second. Of the 150 jobs, 91 had "Personal Adequacy" ranked first, 42 had "Communications Competency" valued most by employers, and only 17 had "Skills Unique to the Job" ranked highest.

d) Did "Unsatisfactory" workers lose their jobs?

Almost one-third of the subjects were rated "Unsatisfactory" by their employers, despite the fact that all had been employed more than 90 days at the time the evaluation was made. Apparently, a considerable portion of those who were "Unsatisfactory" were not dismissed. The test of the relationship between the rating of "Satisfactory"-"Unsatisfactory" and the rank on "Overall Satisfactoriness" was predetermined to be close, but the specific frequencies were of some interest. The table associated with this relationship registered the proportions of subjects who were ranked lowest but were still "Satisfactory," plus those who were "Unsatisfactory" but still not lowest in rank.

e) Which boys got which jobs?

In testing relationships between the school experience factors and the definitions of jobs obtained, no significant relationships were found between achievement or attendance and the job-content emphases (except that some clues for larger studies may have been provided). On the demandingness of jobs obtained, however, the relationship was significant for class rank, English, and vocationally-oriented courses, with the higher achievers tending to have the more-demanding jobs. No relationship was found between school attendance and demandingness of jobs.

f) Who got jobs related to training received?

When those among the vocationally-oriented who had jobs which were related to the training received were compared to those whose jobs were not related to training, differences were indicated, in respect to the grade average in vocationally-oriented courses, favoring those who had the jobs related to training. This relationship was reflected in class rank to the extent that vocationally-oriented courses were a part of class rank. But, the achievement

level in English and the attendance record seemed to have no relationships to graduates obtaining jobs which were related to the vocationally-oriented high school training they had received.

g) Are bosses in certain kinds of jobs harder to please?

Tests were conducted to try to ascertain relationships between the job definitions and the evaluations of satisfactoriness which the employers had made on clusters of graduates. No significant relationships were found in any of the tests. This outcome tends to support a supposition that employers tend to rank about the same proportions of workers "Satisfactory" and "Unsatisfactory," regardless of the type or demandingness of the job. Therefore, no case can be made for a supposition that vocationally-oriented training, for example, tends to help many boys obtain (or keep) jobs which are too demanding for them.* (Instead, the small proportion of jobs where "Skills Unique to the Job" was ranked as most important helps to make a case for paying greater attention to school objectives related to "Personal Adequacy," even in vocationally-oriented courses, and especially for students who will get these jobs--usually the lowest achievers.)

h) Do the bosses like vocationally-oriented graduates best?

No significant relationships were found between the school programs emphasized and either the ranks or ratings of satisfactoriness. One test which resulted in a probability associated with the chi-square statistic between .05 and .10, on "Satisfactory"-"Unsatisfactory," was in the direction of favoring the vocationally-oriented group. In regard to the job definition, no relationships were found between the classification by school program emphasized and either the job-content or demandingness dimensions.

i) What differences do the hiring procedures make?

When the 48 "carefully selected" workers were compared to the 43 "carelessly selected" workers, some differences were noted. First, the "careless" hiring tended to be done by the owners themselves, while the "careful" hiring was usually done by employed managerial personnel. "Careful" selection was recorded as often

---

*No objective record was made of the number of boys who were vocationally-trained, who then obtained a job related to their training with a high demandingness rating, and then were fired before 90 days. A few such cases were noted.

for general graduates as for vocationally-oriented graduates, and as often for one school as for the others. "A" students in vocational courses tended to be "carefully selected," as they also tended to have the best jobs, but English grades and attendance record seemed to make no difference--in the "careful-careless" context.

j) Can satisfactoriness be predicted by academic grades?

The central set of tests in the study probed for relationships between the measures of school achievement and the ratings and rankings of satisfactoriness by employers. By these means the hypothesis was tested which proposed that satisfactoriness in employment might be predicted by certain school experience factors in much the same way that achievement in college ("ranked satisfactoriness" of another sort) can be predicted by high school class rank. The findings pertaining to class rank and English achievement did not support the hypothesis, in that the probability values associated with the chi-square statistics did not approach the significant level. Several alternative explanations of this outcome might include lack of competitive spread in co-worker clusters, lack of true similarity of performance qualities evaluated, and a number of others (discussed elsewhere in this volume.)

k) What does seem to predict success?

The hypothesis that satisfactoriness would be predicted by school achievement was partially supported by findings pertaining to grade averages in vocationally-oriented courses and the attendance record. (Attendance was considered to be an indicator of achievement, in this context.) The breakdown of frequencies illustrated that the significant findings in the case of the grade average in vocationally-oriented courses vs. the rank on "Skills Unique to the Job," was almost entirely the result of observations on a number of subjects who had both the lowest school achievement in vocationally-oriented courses and also the lowest rank on "Skills Unique to the Job." The specific frequencies associated with tests involving attendance reveal similar concentrations of subjects where poorest attendance was associated with lowest ranks and ratings by employers. Subjects with the lowest score for attendance were absent and/or tardy 55 to 100+ times in three years; therefore, a reasonable assumption is that chronic truancy is associated with other characteristics which caused these individuals both to have low achievement in vocationally-oriented courses and to be ranked low by employers.

CHAPTER V

CONCLUDING STATEMENT

Theoretical Observations

General observations

The study is entitled a pilot study because the outcomes are not conclusions which can be applied to whole graduating classes or even necessarily to similarly-selected graduates of any school. The methods used to define jobs were arbitrary and experimental. The contribution of the study may be to serve as a source of ideas or of hypotheses to be tested in further research.

Numerous studies over many years will be needed to make progress toward a validation of curriculum through ascertaining outcomes in post-school behavior. The job-setting is considered to be appropriate for continued research because it is common to most graduates of school programs, it has some standard features (such as required attendance and other features related to evaluating personal adequacy), and the potential for evaluation is present in the supervisor-worker relationship.

The "affective" goals of education--attitudes, interests, satisfactory human relations, and values--may be the most important but are least subject to evaluation. The environment of the job holds the best promise for fruitful research, partly because the affective domain of behavior is becoming more important on the job--both for job performance and in regard to independent ends.

Observations specifically related to the study

The research on prediction of college success indicates that high school achievement predicts but that the pattern of courses taken does not. Research on prediction of vocational success has had a more difficult time, partly because of the lack of a comparably definitive criterion. The pilot study reported in this volume suggests that prediction of poor success may be easier than the converse, perhaps because factors such as poor school attendance tend to be associated with a complex of undesirable characteristics which are reflected in low achievement as well.

The uniformity of the non-significant findings suggests that the various factors and forces which determine which boys obtain which jobs resulted in co-worker groups with relatively short ranges of characteristics which please or do not please their supervisors. If this supposition is correct, it would, together with the low reliability of ratings, explain most of the lack of significant findings. Of course an alternative explanation could be that the whole school situation is too different from the work situation to allow for valid constructs between specific school achievement and supposedly related job-performance factors. This was probably the case, especially, in the construct between English grades and "Communications Competency" on the job.

No satisfactory ultimate criterion for evaluating the outcomes of school experience exists for graduates who go directly into jobs. The same problem exists for graduates of college programs, of course, since success in professional programs is still an intermediate criterion. It is of great importance that this problem be given sufficient attention, for until adequate predictive relationships can be established between education and all forms of post-school behavior, curriculum will continue to be developed and executed on a subjective and largely individual basis.

Recommendations for Further Study

Further development of instruments

The method of defining jobs on a grid, with "demandingness" on one axis and "job content" on the other axis, may be useful if further refined. The advantages of generalizing these two components, instead of attempting to provide detailed definitions of thousands of jobs, are these:

a) Automation and rapid technological change necessitate adaptability of workers (perhaps each square on the grid can represent a "family" of jobs within which a worker could easily adapt because they are fairly equal in difficulty and emphasize the same characteristics, even though their titles and detailed descriptions might sound very different);

b) Follow-up studies show that as many as half of all trained workers do not get placed or retained in a job they were trained for (perhaps the more generalized definition, and a more generalized training, would provide for better utilization of training).

A number of other features of the study may have pilot utility, especially the method of obtaining evaluations from the employers.

New studies needed at the post-high school level

Most research currently underway pertaining to problems similar to those approached in the present study appears to be focused on the effectiveness of post-high school programs of vocational and technical education. Examples are the "Specialty Oriented Student Research Program" in progress at the State University of Iowa, and the study on "Preparation of Youth for Effective Occupational Utilization" underway at the Pennsylvania State University and Rutgers-The State University.

The research emphasis on post-high school programs may be justified because of the distinct trend toward having the bulk of youth take pre-employment schooling beyond grade 12. If most youth use opportunities for post-high school vocational training (college and junior college programs are included because they are increasingly vocational in purpose), then the evaluation of high school vocational programs may become an unresolved but largely academic problem.

The study reported in this volume was conducted on workers who had no post-high school training because if the same research format were applied to graduates of post-high school programs, at their current stage of development of most post-high school programs, the result would probably be misleading when conditions change in future years. At the time of this study the students in post-high school programs were "volunteers," while the high school group studied (after extracting those who went on to post-high school training) were "draftees" (largely reluctant students). The two types, if compared, would likely have different distributions of school characteristics and achievement, placement in related jobs, and evaluations of satisfactoriness in employment.

As soon as post-high school training is nearly as essential to obtaining satisfactory employment as high school graduation is today, the investigator believes, the students at grades 13 and 14 level will also tend to possess the characteristics of "draftees," (because the "volunteers" will then be in grades 15 and 16 and beyond), and their curricula will be subject to the inertia that large capital investments in buildings and large proportions of tenure staff tend to produce.

Needs for basic research

(1) The "criterion problem" will perhaps never be resolved, because most ultimate criteria are inter-personal, subjective, and in a state of constant change. However, there is hope that as employers become more sophisticated in supervisory methods

and more appreciative of research, enough progress can be made so that at least some gross approximations may be made which relate school experience to job performance.

(2) Much work is needed in regard to instruments and techniques for predicting outcomes of education, for until relationships between school experiences and behavior in post-school situations can be put on a cause-effect basis instead of a predictive basis only, there will be no real evidence that many elements of education do more than screen and select candidates for their eventual vocational status. The necessity of specific formal elements of curricular experience will continue to be assumed.

(3) Automation and semi-automation promise to further reduce the importance of individual performance on many jobs--at least performance in the ways which formerly were of great significance, such as technical skill, strength, endurance, or skill in person-to-person salesmanship. Nevertheless, most people will continue to spend a large part of their lives on-the-job, and will continue to need the emotional fulfillment of being important to the accomplishment of certain goals. Basic research should be conducted to further evaluate individual needs, and to study ways of fulfilling affective needs of workers (appreciations, values, etc.) in ways which may or may not be related to the production or distribution of material products.

APPENDIX A

SUPPLEMENTARY TABLES

APPENDIX B

FORMS USED IN GATHERING DATA

FORM I: INTERVIEW BETWEEN COUNSELOR AND GRADUATE

FORM II: DATA FROM SCHOOL RECORDS

FORM III: LETTER AND INFORMATION SENT TO EMPLOYERS

FORM IV: INTERVIEW WITH EMPLOYER

Part A - Background Information plus "Demandingness"

Part B - Criteria Cards plus Name Slip for Rankings

TABLE 1A

OBSERVED FREQUENCIES USED IN TESTING THE RELATIONSHIP BETWEEN MECHANICAL APTITUDE SCORE (DAT) AND JOB-CONTENT EMPHASIS

Mechanical DAT (in "stens")	Job-Content Emphasis*			
	C	Pc	Ps	S
8	10	7	5	2
7	6	7	6	2
6	5	12	4	4
5	7	8	6	6
4	7	6	7	2
3	4	5	8	1
	39	45	36	17

$X^2 = 12.474$ d.f. = 15 $.75 > p > .50$

*Wherever the original classifications produced too-few expected frequencies for valid chi-square applications, classifications were grouped as necessary. (Expected frequencies are not shown in tables but were included in the computer print-out to assist the writer in making interpretations.)

In the above table, CPS and CSP jobs have been grouped as "C" jobs, and SCP and SPC jobs are grouped as "S" jobs. "Pc" is a briefer symbol for jobs where "Personal Adequacy" ranked first, with "Communications Competency" second. "Ps" differs from "Pc" in that "Skills Unique to the Job" ranked second in the "Ps" jobs.

TABLE 2A

OBSERVED FREQUENCIES USED IN TESTING THE RELATIONSHIP BETWEEN MECHANICAL APTITUDE SCORE (DAT) AND EMPLOYER'S RANK ON "SKILLS UNIQUE TO THE JOB"

Mechanical DAT Score (in "stens")	Rank (score)* for "Skills Unique to the Job"			
	4	5	6	7
8	3	8	6	7
7	5	3	8	5
6	9	8	3	5
5	7	8	6	6
4	6	6	7	3
3	6	4	5	3
	36	37	35	29

$X^2 = 10.269$ d.f. = 15 $.90 > p > .75$

*It should be noted that all scores assigned to the ranks designated by employers on the satisfactoriness factors are interpolated into approximations of "stens," using the intermediate step of "Table XX, Transformation of Ranks to Standard Scores," which appears in Walker and Lev, op. cit., p. 480.

First, each rank was assigned a standard score from the table. For ranks among clusters of three and four, the table was extended by graphic means to obtain estimates.

Next, to equate the midpoint of 50 to 5.5, all standard scores of 30-39 became "4", all standard scores of 40-49 became "5", all standard scores of 51-59 became "6", and all standard scores of 61-69 became "7". In clusters of 3 and 5 workers, the rank frequently fell at the standard scores of 40, 50, and 60, which are the midpoints between the one-digit values. In these cases, the rank was assigned upward or downward according to whether or not one or more of the workers in the cluster had been rated "unsatisfactory"--under the assumption that an unsatisfactory worker still working past 90 days would tend to indicate a lower standard of hiring and retaining workers. (This procedure was thought to be at least better than the alternatives of tossing a coin or placing subjects higher or lower alternately.)

TABLE 3A*
(I-a-1)

OBSERVED FREQUENCIES USED IN TESTING THE RELATIONSHIP BETWEEN HIGH SCHOOL CLASS RANK AND JOB-CONTENT EMPHASIS

Class Rank (in "stens")	Job-Content Emphasis			
	C	Pc	Ps	S
8	10	7	2	3
7	8	7	7	2
6	11	11	4	2
5	6	8	12	5
4	4	9	6	1
3	3	8	10	4
	42	50	41	17

$X^2 = 19.260$ d.f. = 15 $.25 > p > .10$

*Also appears in Chapter IV as Table 21.

TABLE 4A*
(I-a-2)

OBSERVED FREQUENCIES USED IN TESTING THE RELATIONSHIP BETWEEN HIGH SCHOOL GRADE AVERAGE IN ENGLISH AND JOB-CONTENT EMPHASIS

English Average (in "stens")	Job-Content Emphasis			
	C	Pc	Ps	S
8	11	10	3	4
7	8	5	4	4
6	5	7	10	4
5	10	11	9	1
4	6	13	6	2
3	2	4	9	2
	42	50	41	17

$X^2 = 20.892$ d.f. = 15 $.25 > p > .10$

*Also appears in Chapter IV as Table 22

TABLE 5A
(I-a-3)

OBSERVED FREQUENCIES USED IN TESTING THE RELATIONSHIP BETWEEN HIGH SCHOOL GRADE AVERAGE IN VOCATIONALLY-ORIENTED COURSES AND JOB-CONTENT EMPHASIS

Vocationally-oriented Average (in "stens")	Job-Content Emphasis			
	C	Pc	Ps	S
8	6	4	3	5
7	4	5	6	3
6	8	8	6	2
5	5	7	5	3
4	6	7	6	1
3	3	5	6	2
	42	50	41	17

$X^2 = 8.043$ d.f. = 15 $.95 > p > .90$

TABLE 6A
(I-a-4)

OBSERVED FREQUENCIES USED IN TESTING THE RELATIONSHIP BETWEEN RECORD OF HIGH SCHOOL ATTENDANCE AND JOB-CONTENT EMPHASIS

Attendance Record (in "stens")	Job-Content Emphasis			
	C	Pc	Ps	S

HIGH SCHOOL: SUBJECT'S NAME: _____

UV___; UC___; SC___. Home Telephone: _____

FORM I: INTERVIEW BETWEEN COUNSELOR AND GRADUATE

Note to Counselor: Start interview by referring, as may be the case, to either a prior follow-up done by the school or to a recent phone call to the home. Establish purpose by saying, "We are trying to keep up with changes here at school on how to advise new seniors on getting jobs and also to change some courses so they will learn more things in school to help them do well on their jobs. So we are calling all boys from the 1963 class who are working or have been working this past year, to get your opinions on a few points."

---

1. "Are you working now?" ---------- ___Yes (THEN ASK QUESTIONS A THRU F)
___No (IF NO, SKIP TO ITEM 2,B)

A) "Where do you work, what company?" _____

B) "Where is that located?" (APPROXIMATE) _____

C) "What do you do, what do they call your job?" _____

D) "When did you start there, what month?" _____

E) "Is this a full time, 40 hour a week job?"---------- ___Yes ___No

F) "Could this be a permanent job if you wanted it to be?"___Yes ___No

---

2. A) (ASK ONLY IF HE STARTED HIS PRESENT JOB SINCE LAST SEPTEMBER--1963):
"Did you have a full time job before the one you have now?" ___Yes ___No
(IF YES, SKIP TO 2,C BELOW. IF NO, STOP AND USE #1, ABOVE)

B) (ASK ONLY IF HE IS NOT WORKING AT THE TIME OF THIS INTERVIEW):
"Did you have a full time job at all since your graduation?"___Yes ___No
(IF YES, THEN CONTINUE. IF NO, THEN CONCLUDE INTERVIEW.)

C) "Where did you work,what company?" _____

D) "Where is that located?" (APPROXIMATE) _____

E) "What did you do, what did they call your job?" _____

F) "When did you start there, what month?" _____

G) "Was this a full time, 40 hour a week job?" ---------- ___Yes ___No

H) "Could this have been a permanent job if you had wished?"-- ___Yes ___No

---

3. (IF CASE 2,F--ABOVE--SHOWS THERE WAS TIME TO HAVE HAD STILL ANOTHER JOB, LASTING THREE OR MORE MONTHS, THEN TURN TO BOTTOM OF LAST PAGE WHERE A SPACE IS PROVIDED FOR THIS.)

FORM I: Interview between Counselor and Graduate (cont.)

---

4. A) "Well, let's talk about your job with _____." (THE ONE SELECTED) "What would you say was the one most important skill you need(ed) on this job?--probably the thing you do that would matter most if you didn't do it right."

   B) "Was your high school education important in helping you do this?__Yes__N
   (IF YES) "How do you feel you have been helped?" (COULD BE COURSES, GUIDANCE, ACTIVITIES)

---

5. A) "Next, what would you say is (was) the one most difficult thing you do (d on this job?--probably the skill or operation that was hardest to learn when you first started."

   B) "Was your education important in helping you on this? ___Yes__N
   (IF YES) "How do you feel it was helpful?"

---

6. A) "What part of this job or what thing do (did) you do that takes up (took up) the most time? -- at least on most days?"

   B) "Was your education important in helping you on this part? ___Yes__N
   (IF YES) "How do you feel it was helpful?"

---

7. A) "Do (did) you have to read and write quite a bit on this job?" ___Yes__N
   (IF YES) "In what ways?"

   B) (IF YES FOR A) "Was your high school education helpful for this, or do you feel your grade school education was enough?" _____

   C) (IF HIGH SCHOOL WAS HELPFUL) "In what ways was high school helpful?"

---

8. A) "Do (did) you have to use math or arithmetic on this job?" ___Yes__N
   (IF YES) "In what ways do you use it? (MONEY, MEASUREMENTS, ETC.)

   B) (IF YES FOR A) "Was your high school education helpful for this, or do you feel your grade school education was enough?" _____

   C) (IF HIGH SCHOOL WAS HELPFUL) "In what ways was high school helpful?"

---

9. A) "Do (did) you have to talk to people quite a bit as part of your work?" ___Yes__No
   (DON'T ASK IF OBVICUS. AS IN CASE OF STORE CLERK OR CARRY OUT BOY)

FORM I: Interview between Counselor and Graduate (cont.)

---

9. (cont.)
   B) "In what ways is (was) it important to talk to people on this job?

---

10. "Now, how did you happen to get this job?" Did you know somebody who helped you?" (AS HE TELLS ABOUT THIS, CHECK POINTS BELOW. NAME POSSIBILITIES IF NECESSARY.)

    ___ Newspaper ad;
    ___ Employment service;
    ___ Relative or friend was helpful--How?_____
    ___ Someone from school was helpful--Who?_____
    ___ Other method. What?_____

---

11. "When they hired you, did they say why they chose you instead of someone else?" ___ Yes ___No
    (IF YES) "What reason did they give?"

---

12. "Did they say you had to have a certain kind of training, or have certain courses in high school to be hired for this job?" ___ Yes ___No
    (IF YES) "What training or what courses?"

---

13. A) "Were they looking for someone with experience working on a job something like this?" ---------- ___ Yes ___No

    B) "Did you have any work experience doing something like this before, either part time or full time? ---------- ___ Yes ___No

    C) (IF YES IN B) "What jobs have you had before the job we've been talking about?--including part time or summers while still in high school?"
    (EXCEPT THOSE LISTED ON PAGE 1 OR 3) Full time:_____ (NAME JOB) How long?____
    Part time:_____ How long?____

---

14. "When you first started this job, how did they help you learn what to do?" (DISCUSS BRIEFLY UNTIL IT IS CLEAR WHICH ITEM BELOW COMES CLOSEST TO THE SITUATION. YOU MAY NEED TO CHECK TWO ITEMS. ALSO ASK UNDERLINED QUESTIONS IF THEY APPLY.)

    ___A) Very little on-the-job training. (SOMEONE JUST TOLD HIM WHAT TO DO AND HE DID IT.)

    ___B) Assigned to a **senior** co-worker. (THIS MAY BE A FORMAL APPRENTICESHIP OR JUST "BUDDY" CO-WORKER. STATE WHICH TYPE.) _____

501 to 96

---

14. (cont.)
C) Informal training program. (A FEW MATERIALS TO READ, PERHAPS A FEW LECTURES OR DEMONSTRATIONS. ASK, BELOW, ABOUT TIME AWAY FROM DUTY.)

"How many hours in all did you do this on company time?" (APPROX. HOURS.)_____

D) Formal on-the-job training program, with a schedule of training sessions on company time. (ASK) "How much time was spent at this a week?" _____ "For how many weeks?"_____

---

15. "If we were to send a senior down there next May or June, someone who wanted a job like the one we have been talking about, whom would he ask to see?" _____
name or title

A) (IF NAME OR TITLE GIVEN, ASK): "Is this the same person who interviewed and hired you? ___Yes (Go to B) ___No (SKIP TO C)

B) (IF YES in A, ABOVE): "Is he your boss?"------ ___Yes ___No

C) (IF NO IN A, ABOVE): "Then who did hire you?"_____
name and/or title

D) (RE PERSON IN C): "Is he your boss?"---------- ___Yes ___No

E) (IF ANSWER ABOVE IS NO): "Who is your boss, then?"_____
name and/or title

---

16. (ASK EVERYONE THIS NEXT QUESTION IMMEDIATELY AFTER GETTING THE NAME OR TITLE OF THE BOY'S BOSS IN B, D, OR E, ABOVE IN #15. WE DON'T WANT HIM TO THINK WE ARE UNUSUALLY INTERESTED IN HIS BOSS, NOR DO WE WANT HIM TO SAY ANYTHING MORE ABOUT HIS BOSS.)

A) "About how many people work for your boss?"----------_____

B) "How many of these do just about the same kind of work that you do?"_____

C) "Are these mostly young fellows like yourself?"_____

---

17. (CONCLUDE INTERVIEW. SAY SOMETHING LIKE THIS):
"Well (BOY'S NAME), that ought to be enough information so we can study your job along with the others. We will end up knowing what kind of work all of you do, and we will know what you and the others feel about your schooling."

17. (cont.)
"Later we are going to ask your employers to fill out a form where they will also tell us what they think the school is doing right and what the school could do better. We won't connect your name with it except that you will be one of the graduates of the high schools they will have in mind when they answer our questions. We won't mention that we have talked with you."

"Thanks very much for your help."

END OF INTERVIEW - POINT BELOW IS FOR OVERFLOW FROM PAGE ONE

(3) (FROM PAGE ONE--IN CASE SOMEONE HAS HAD MORE THAN TWO JOBS)

A) "Where did you work, what company?" _____
B) "Where is that located?" (APPROXIMATE) _____
C) "What did you do there, what do they call your job?" _____
_____
D) "When did you start there, what month?" _____
"When did you stop?" _____
E) "Was this a full time, 40 hour a week job? ___Yes ___No
F) "Could this have been a permanent job if you had wished? ___Yes
___No

HIGH SCHOOL:
UV___; UC___; SC___.

SUBJECT'S NAME_____

FORM II: DATA FROM SCHOOL RECORDS

___1. Days absent plus days tardy in grades 10 through 12.

___2. Intelligence quotient on group-administered test in grades 6-9.

___3.	(a) DAT - Verbal scale	(	)
___	(b) " - Numerical scale	(Percentile ranks	)
___	(c) " - Abstract scale	(based on	)
___	(d) " - Space scale	(national norms	)
___	(e) " - Mechanical	(	)

___4. Class rank in grade 12 (Percentile rank based on composite marks in grades 10-12)

___5. English grade average (Based on 6 semesters of required English)

___6. Grade average of vocationally-oriented courses (based on up to ten most recent semesters in courses with "vocational intent")

Vocationally-oriented courses taken in grades 10-12

Grade 10	Grade 11	Grade 12

QUESTION: Could this graduate (of UC or SC) compete on a fairly equal basis on a job related to all or part of the above vocationally-oriented training with an otherwise identical boy who had training at the vocational high school?

CHECK ONE: ___Yes; ___No; ___Yes, if some on-the-job training were provide

EDUCATIONAL RESEARCH and DEVELOPMENT COUNCIL
of the Twin Cities Metropolitan Area

COLLEGE OF EDUCATION · UNIVERSITY OF MINNESOTA · MINNEAPOLIS, MINNESOTA

(FORM III, Part A)

(The inside address and salutation were typed personally to each employer. The body of the letter was individually typed by automatic typewriter.)

We were given your name in a telephone inquiry as the person to contact for obtaining authorization to interview one or two employees of your company.

What we seek, specifically, is a few minutes of time for a brief interview with you or with a person you designate, plus another brief interview with a supervisor in your organization (this may be the same person, or yourself, if you would indicate this). A research project endorsed by our Council is being conducted by Howard E. Bergstrom, who is a school administrator engaged in conducting this study. Mr. Bergstrom will be contacting you in a few days by telephone, and will arrange with you a convenient time for these interviews.

The enclosed page describes the purpose and the method of the study. In short, we want to gain from both employers and young workers some information which will help improve vocational training and vocational counseling in high schools. We are confident that you will want to work with us toward this goal.

You will note from the letterhead that this study is endorsed by the Minneapolis Public Schools and the St. Paul Public Schools, as well as by the suburban districts listed on this page. Findings of this study, along with other studies being conducted, will be made known to school officials and will be helpful to them in improving the education of young workers you employ in the future.

Mr. Bergstrom will answer any questions you may have when he telephones your office.

Sincerely yours,

Donald E. Davis
Executive Secretary

FORM III, Part B

MEMORANDUM ACCOMPANYING THE LETTER TO EMPLOYERS

EDUCATIONAL RESEARCH AND DEVELOPMENT COUNCIL
OF THE TWIN CITIES METROPOLITAN AREA

TO: Employers selected for interviews in the study of entry-level jobs

FROM: Howard E. Bergstrom, Director of the study

SUBJECT: Questions that employers will probably want answered with the answers

What is the purpose of the study?

The schools want to get the opinions of both a sample of young male workers and their supervisors as to what schools might do better in the future to prepare young workers to succeed on their jobs. This information may be used to recommend changes in training program and in the vocational guidance provided in high schools.

Just who is being studied?

We are interested in getting information about young male workers (ages 18, 19, or 20, approximately), who graduated from or at least attended a high school in the Twin Cities area. (We will not study all of these intensively, of course, but statistical sampling methods will be used to identify representative groupings after the total group is identified.) We are, at th time, studying only those who go to work directly after high school, who do n take any additional training.

How did you (the employer) get selected as one of the employers who would be involved in this study?

We started with the lists of graduates from the high schools, and took a sampling of them. Then we contacted these graduates to find out where they work. You are, or have been in recent years, the employer of at least a few of these graduates. In this way we have obtained a sample of employers who actually employ boys directly out of high school. Of course, some employ many and others employ very few.

Just who is to be interviewed?

First, we will telephone your office to find out whom we should dea with in the next step. We will first want to talk with someone who has the names of past or present workers who fit the job description(s) listed for you company. Next, we will wish to talk with the person who is the supervisor of the group of young men who work under this specific job description. This should be the person of highest authority who still knows the workers quite well as individuals.

FORM III, Part B (cont.)

What questions will be asked in the interview?

In the first interview mentioned above (in some places of employment the same person may supply both interviews) the job description will be confirmed or corrected. Then, the qualifications for hiring and the metho of breaking in new workers will be asked about. Third, the names of past and present workers will be listed. In the second interview, with the supervisor of the workers, the workers will be discussed on four points. In both interviews, suggestions to the schools for making improvements will be encouraged and recorded.

Who will see the information given in the interviews?

The director of the study will be the only person who will ever see the information in a form where names of workers or employers are identifiabl He is pledged to transcribe it into summary form for analysis on a computer, so that what emerges for wider distribution will not identify either workers or employers.

FORM IV: INTERVIEW WITH EMPLOYER

Part A--Background Information, plus "Demandingness"[1]

---

1. BASIC DATA Date_____

Company_____ (1)

Address_____ (2)

Personnel Director_____ (3)

Job Boss_____ (4)

Total Employed by Company_____ (5)

Number in this job def._____ (6)

Number working for this boss in this job_____ (7)

Number of above 1 to 3 years out of high school_____ (8)

---

2. DESCRIPTION OF THE JOB IN QUESTION

What operation takes up the most time?_____ (1)

What part of this job is most important--that is, makes the most difference when it is done wrong?_____ (2)

What part of this job seems to be the hardest for beginners to learn (anything from getting to work on time to some complex task)?_____ (3)

---

3. RECRUITMENT FOR THE JOB

IN HIRING THE YOUNG WORKERS INDICATED IN #8 IN PART A, WHICH OF THE FOLLOWING WAS THE METHOD USED IN MOST CASES?

An employment agency sent applicants._____ (1)

We ran ads in the newspapers._____ (2)

---

[1]The interviewer filled out the blanks, while he and the employer each had a copy to aid their discussion.

3. (cont.)

We asked the high school office or certain teachers to suggest some. _____ (3)

Our own employees encouraged friends or relatives to come in and apply. _____ (4)

Other method (name it) _____ (5)

4. CRITERIA IN SELECTION

Please number the items below according to which is the most important, which is second most important, etc., in choosing the young workers indicated in #8 or Part A.

Had completed certain vocational courses in school that we want for this job. _____ (1)

Got high scores in the rest of tests which we give candidates for this job. _____ (2)

He made a good impression in the interview (made us think he could do it). _____ (3)

We contacted his high school and they gave him a good recommendation. _____ (4)

He had some prior experience at this. _____ (5)

5. ON-THE-TRAINING FOR THIS JOB

WHICH ONE OF THE FOLLOWING STATEMENTS COMES CLOSEST TO THE WAY THAT YOUNG WORKERS WITHOUT EXPERIENCE ARE GIVEN ON-THE-JOB TRAINING FOR THIS PARTICULAR JOB?

We tell him what to do, put him to work, watch him, and correct him where wrong. ("line" supervision) _____ (1)

We assign him to one of the experienced men, to work as a sort of assistant for awhile. (How long? _____ weeks) _____ (2)

5. (contd.)

We have a regular, standard way of breaking in new men--they take material home to read, they see demonstrations, etc., but very little company time is spent on this._____ (3)

We have regular, formal on-the-job training, and _____ hours of company time a week, for _____ weeks, is allowed. _____ (4)

6. SKILL AND OTHER REQUIREMENTS

CHOOSE ONE OF THE FOUR ITEMS BELOW FOR THIS PARTICULAR JOB, ACCORDING TO WHICH COMES THE CLOSEST TO DEFINING IT CORRECTLY (add oral illustration).

This is a tough job to fill for a boy just out of high school--he not only has to have high skills of specific kinds but he has to be dependable and quick to learn._____ ( )

The boy doesn't have to have much special training other than a high school education, but he has to be dependable and quick to learn._____ ( )

Most high school graduates can learn to handle this job if they are honest and willing, but it does take quite awhile to learn the operations if they haven't learned them in school._____ ( )

Almost any boy can handle this job if he is honest and willing, and he can pick up all of the essential operations in a few days._____ ( )

FORM IV: INTERVIEW WITH EMPLOYERS

Part B--Criteria Cards and Name Slips for Ranking

Card 1

C C

COMMUNICATIONS COMPETENCY

Reading instructions and following them;

Writing records, receipts, reports, etc.;

Following instructions given orally;

Talking with customers or co-workers as a necessary part of the job;

Recording and using numbers (here considered to be a part of language or communications) as in making change, taking measurements, etc.

Card 2

P P

PERSONAL ADEQUACY

Gets to work on time, hardly ever absent;

Works to the best of his ability;

Honest, and is loyal to his employer;

Gets along well with other workers;

Personal qualities needed for the particular job.

Card 3

S S

SKILLS UNIQUE TO THE JOB

Things everyone has to know how to do to hold this job;

Operations or skills the worker has to learn either in school (vocational training) or otherwise time has to be spent to teach him on the job.

Card 4

T T

OVERALL SATISFACTORINESS

All factors combined, including some points not included on the other three cards;

Also, indicate where dividing point is between those you would willingly re-hire and the others (oral illustration).

FORM IV, Part B - Criteria Cards and Name Slips (contd.)

Name Slip[1]

Name _____

Job _____

Eval. as of (date) _____

Started _____ Left _____

to go to _____

High School _____ Year _____

No. in wk. gp. _____

Job-content factors

			T	S
				U

---

[1]A name slip was made out for each member of the group to be ranked. (Some were eliminated as more information disqualified them.) The letters C, P, and S were written in the top squares as the employer indicated the order of their importance. Then the ranks were written in the bottom squares as they were made, ending in "T" (for "Total", or "Overall"), and the "S" or "U" was checked.

FOREWORD

Vocational Agriculture has been a part of Virginia's public school system for forty-five years. From a small beginning in 1917, it has grown to occupy an important place in the curricula of most high schools serving rural areas. In addition to providing organized instruction for young men and adults already engaged in farming, it has provided a much-needed training program for high school boys planning careers in all phases of agriculture.

As Virginia seeks to maintain a balance between industry and agriculture it is important that appropriate training for careers in agriculture be provided at the high school level. In attempting to provide the best possible instruction for students enrolled in vocational agriculture classes, this guide has been prepared for use in developing the instructional program by years. Special emphasis is given to certain basic units of instruction which will provide understandings essential to success in all fields of the industry of agriculture. This emphasis should help teachers to give breadth, depth and increasing significance to their instruction in the agricultural sciences.

This publication has been prepared jointly by the agricultural education staffs of the State Department of Education and Virginia Polytechnic Institute with the able assistance of many teachers of vocational agriculture. Special credit is given Dr. E. G. Thompson and the staff in agricultural education at V.P.I. for editing the final copy. It is intended to serve teachers, school administrators, and others as a guide for developing instructional programs in vocational agriculture and guidance counselors for counseling students about vocational agriculture.

This guide should be used in conjunction with V.P.I. Agricultural Education Bulletin No. 17, "Teaching Units for Vocational Agriculture in Virginia," revised 1962.

INTRODUCTION

Daniel Webster said, "Unstable is the future of the country which has lost its taste for agriculture. If there is one lesson in history which is unmistakable, it is that the national strength lies very near the soil." Agriculture is the basic industry in Virginia and the United States. Other industries cannot survive without the raw materials of agriculture. Our national security would be endangered if we were to neglect the education of our people in agriculture. With the rapid growth of our population, the importance of agriculture will certainly increase in the future. Education in agriculture is also important in terms of cultural changes and national stability.

Within the past few years the concept of the industry of agriculture has changed to include the businesses that process, market and distribute agricultural products and the businesses that supply and service agriculture, as well as the business of farming or the production of agricultural products. The number of people engaged in the business of farming is declining but the need for adequately trained people in other agricultural businesses is increasing.

Vocational agriculture is an integral part of the total school program. The course is based upon the needs, interests and capabilities of the individuals in the community to be served. These individuals consist of high school students enrolled in vocational agriculture courses and out-of-school youths and adults who are interested in the industry of agriculture. One of the objectives of vocational agriculture has been, and still is, training for proficiency in farming, but changing demands and scientific developments have created a need for increased emphasis on training individuals for employment in the total industry of agriculture.

Those who teach must have a good insight into the way of life of those they teach. Current trends indicate that our way of life is constantly changing. These changes have many implications for vocational agriculture. The following are among the more obvious implications:

1. The job of preparing individuals to engage in farming is of major importance. It is a more complicated and difficult job than ever before. Although there is a smaller percentage of the people engaged in farming, the quality of their products and their efficiency of production must be greatly improved.

2. The influence of developments brought about by science and technology necessitates greater emphasis in the fields of farm manage-

ment and farm mechanics. More attention should be given to teaching basic principles upon which sound management decisions are based.

3. The family farm is the pattern on most of the farms in Virginia. Vocational agriculture should continue to contribute to the development of the farm family unit.

4. In many communities the vocational agriculture program needs to give more attention to the educational needs of people who work at two jobs—farming and in other employment.

5. Rural people need a basic background in the science of agriculture that will serve them well in any agricultural business in which they might work at some future time. Vocational agriculture can increase its contribution to both agriculture and other industries by preparing more individuals for opportunities in the total industry of agriculture.

6. Vocational agriculture provides valuable training for students who plan to attend college. Youths must be given the opportunity to explore and discover their interests and abilities. For many of them their only experience with actual farming before they reach the age of eighteen will be through their supervised practice programs.

7. Vocational agriculture offers an opportunity for making the life sciences and other courses more meaningful to many students. Biology, Chemistry, Physics, Mathematics, Economics, English, and other subjects can be so related to the supervised practice programs and problems in agriculture that the student sees their meanings in true-to-life situations.

8. Farming is so dynamic that much of the vocational training in agriculture must be done through young farmer and adult farmer classes, as well as for high school students, and through individual on-farm instruction for all three groups.

9. Many high school students need to learn through school, home and community experiences, the basic skills and understandings pertaining to agriculture.

10. The purposes of the Future Farmers of America and New Farmers of America organizations are well suited to the needs of the vocational agriculture student regardless of his occupational choice.

11. The need for capable leadership in agriculture is eminent. Therefore, vocational agriculture teachers and others should provide guidance and counseling in order that students may realize their fullest potential in the industry of agriculture.

THE PURPOSES OF VOCATIONAL AGRICULTURE

Training for useful employment and proficiency in agriculture has long been a major purpose of vocational agriculture. In harmony with the cardinal principles in education, vocational agriculture contributes to the total development of the individual in preparing him for a useful life.

In keeping with current trends in agriculture, vocational agriculture has the following major purposes and objectives:

1. To train high school students for proficiency and establishment in agriculture.
2. To train young and adult farmers for proficiency in farming.
3. To provide a sound background for the successful analysis and management of a farm business.
4. To provide a sound education in agriculture for students who may seek employment in agricultural business occupations or those who are preparing for a professional career in agriculture.
5. To develop worthy use of leisure time, and the desired cultural practices in family living and community responsibility.

WHO SHOULD ENROLL IN VOCATIONAL AGRICULTURE

1. High school students who:
   a. Plan to farm.
   b. Plan to work in the industry of agriculture.
   c. Plan to study agriculture in college to prepare for a professional career in agriculture.
   d. Want the leadership and self-discovery provided through vocational agriculture and who can participate in a satisfactory supervised practice program, including placement for satisfactory farm work experiences or agricultural work experiences.
2. Those who live on a farm and engage in part-time farming.
3. Young farmers who are becoming established in farming.
4. Adults who are farming full or part-time and others who can benefit from instruction in vocational agriculture.
5. Those who may inherit, purchase, or plan to own a farm in the future.

SUGGESTIONS FOR PLANNING AND BUILDING THE INSTRUCTIONAL PROGRAM FOR VOCATIONAL AGRICULTURE

The instructional program for vocational agriculture should be determined locally by the teacher with the assistance that he may get from such sources as the advisory council, farmers, students, parents, faculty, teacher trainers, supervisors, and other professional agricultural workers. The program must be based on the needs of the students, the existing agricultural situation and the trends in agriculture.

The program in vocational agriculture should coordinate mathematics, the life sciences, and the physical sciences in practical experiences carried out on the farm which provides understanding and educational experiences resulting in an improved education for the student.

The suggestions made here are for the purpose of guiding the teacher in preparing his instructional program.

Three bases for determining the curriculum are suggested:

1. The supervised practice programs of students. The first obligation of the teacher is to provide adequate instruction for the successful operation of the individual student's supervised practice program. Each student must carry out a well-planned supervised practice program while he is enrolled in vocational agriculture.

2. Existing situation and trends in agriculture. The second basis is the indication of change supported by improved practices in the production, processing, distribution, and marketing of agricultural products.

3. Selected areas of development for each year. This third basis for curriculum construction may provide emphasis as follows:

First Year: *Getting Started in an Agricultural Business*

This course should provide the experiences necessary to start the student in an agricultural business and should introduce the student to the application of science to agriculture. Experiences must be provided through a well-planned supervised practice program. This course should include a survey of agriculture on the local, state, and national level and a rather detailed coverage of certain basic units in animal science, plant science, farm mechanics, farm family living, and leadership training. In addition to basic units and enterprise jobs there will be selected jobs included in the curriculum for individual instruction in and out of the classroom.

Second Year: *Becoming Established in an Agricultural Business*

The major emphasis in this course should be the revising and expanding of the supervised practice program, with increased emphasis on the production of crops and livestock, and experiences in home and farm mechanics. Basic units will continue to be an integral part of this course, as the student becomes established in an agricultural business. In addition to basic units and enterprise jobs there will be selected jobs included in the curriculum for individual instruction in and out of the classroom.

Third Year: *Developing the Agricultural Business*

The third-year program will include an increased emphasis in the development and expansion of the student's supervised practice program. The major emphasis will be placed on keeping and using records. Students in the third year of vocational agriculture should have well-developed plans for an agricultural business. The basic units and enterprise jobs will serve as the means to further develop the student's agricultural business.

The farm mechanics program will provide the student with the needed experiences in the selection, operation, and maintenance of power machines and equipment, building construction, and the further development of farm mechanics skills. In addition to basic units and enterprise jobs there will be selected jobs included in the curriculum for individual instruction in and out of the classroom.

Fourth Year: *Scientific Management of the Agricultural Business*

In this course the student will analyze and use records and apply basic principles to increase the efficiency of his agricultural business. Instruction will be given in additional basic units in farm management with major emphasis on increased scope and responsibilities in his supervised practice program. Other opportunities should be provided for the student to develop leadership and to further prepare himself as a leader in agriculture and community life. Instruction in farm mechanics will provide for increased skill proficiency, and the application of farm mechanics skills to the increased efficiency of the agricultural business. In addition to basic units and enterprise jobs there will be selected jobs included in the curriculum for individual instruction in and out of the classroom.

Advanced Course: *Conducting a Farm Business*

This course is designed primarily for students enrolled in vocational agriculture for the fifth year. Since a large number of high schools include

vocational agriculture in the eighth-grade curriculum, a few students will desire and need a fifth-year course. These should be carefully selected and limited to those students having well-developed farming programs and definite plans to farm. The advanced course places emphasis on the continued practical and advanced application of managerial problems which confront young men in the farming business. The program is different from that suggested in previous years to the extent that little basic or background information is included. Some of the topics suggested may be the same as in the regular four-year course; however, the advanced course provides a greater opportunity for application of information learned. The course is planned with the thought that classes will be small and more time will be available to assist with individual problems and actual planning of the students' farming business. Instruction should include more demonstrations, field trips, and other forms of laboratory instruction on an individual basis than in the regular course. Students enrolled should have well-developed farming goals and should be in a position to apply instruction to their farm and home situation.

The advanced course is also designed to meet many of the instructional needs for members of young farmer and adult farmer classes. Since many individuals enrolled in these classes will not have had the basic agricultural information necessary for making many of the present-day managerial decisions, it will be advisable in some situations to include more of this type of instruction than is included in the suggested fifth-year course. For example, a basic course in soils may be necessary before the young or adult farmer plans his cropping system or a farm mechanics skill may have to be taught before he can profit from instruction in the adjustment and operation of farm machinery.

SUGGESTED PLACEMENT OF TEACHING UNITS, BY YEARS

VOCATIONAL AGRICULTURE I

Getting Started In An Agricultural Business

Basic Units

Field	*Basic Unit*
Animal Science	Fitting and Showing
Animal Science	Selecting and Grading
Plant Science	Cultivation of Crops
Plant Science	How Plants Grow and Reproduce
Plant Science	Exhibiting Crops
Plant Science	Seedbed Preparation
Plant Science	Soils
Plant Science	Transplanting Plants
Farm Mechanics	Metals
Farm Family Living	Farm Safety
Farm Family Living	Opportunities in Agriculture

Enterprise Jobs

Field	*Enterprise*	*Job*
Supervised Farming		Securing and Studying a Map of the Home Farm
Supervised Farming		Making the Home Farm Survey
Supervised Farming		Estimating Returns
Supervised Farming		Understanding and Planning a Supervised Farming Program
Supervised Farming		Preparing Business Arrangements
Supervised Farming		Planning Farm Jobs
Supervised Farming		Keeping Records
Animal Science	Beef	Origin and Importance
Animal Science	Dairy	Origin and Importance
Animal Science	Poultry	Origin and Importance
Animal Science	Poultry	Selecting and Procuring Birds
Animal Science	Swine	Origin and Importance
Animal Science	Seafood	
	—Blue Crabs	Jobs—1,2,3,4
	—Fin Fishes	Jobs—1,2,3,6
Plant Science	Corn	Planting

Field	*Enterprise*	*Job*
Plant Science	Forestry	Determining the Place of Forestry in the Farming Program
Plant Science	Forestry	How Trees Grow
Plant Science	Forestry	Tree Identification
Plant Science	Forestry	Measuring and Marketing
Plant Science	Home Garden	Planning the Home Garden
Plant Science	Home Garden	Selecting Varieties
Plant Science	Home Garden	Planting
Plant Science	Peanuts	Planting
Farm Mechanics	Farm Shop	Sketching and Plan Reading
Farm Mechanics	Farm Shop	Tool Fittings—Jobs 1-5, 6-20 (as needed)
Farm Mechanics	Farm Shop	Woodworking—General Information. Jobs 1-6 Hand Tools—Jobs 1-5
Farm Mechanics	Farm Shop	Arc Welding—Jobs 1-13 and Exercise a-c
Farm Mechanics	Farm Shop	Hot Metal
Farm Mechanics	Farm Shop	Cold Metal
Leadership Training	FFA or NFA	History and Development of FFA or NFA

VOCATIONAL AGRICULTURE II

Becoming Established In An Agricultural Business

ADVANCED COURSE

Conducting a Farm Business

1. Selecting a farm
2. Developing a farm business management plan:
   a. Planning the cropping system (soils, rotations, fertilizer, forestry, soil conservation plan, etc.)
   b. Planning the livestock program
   c. Determining building needs
      (1) Dwelling
      (2) Livestock
      (3) Poultry
      (4) Crops
      (5) Machinery
      (6) Fencing
      (7) Other
   d. Selecting machinery and equipment
   e. Planning an efficient farm layout
3. Financing the farm business
4. Keeping and analyzing records
5. Filing income tax and social security
6. Legal arrangements (deeds, contracts, wills, leases, etc.)
7. Farm insurance
8. Adjusting, operating, and maintaining farm machinery
9. Providing for maintenance and repair of machinery and equipment (on the farm)
10. Managing the farm woodland
11. Managing the livestock herd or flock:
    a. Dairy

b. Beef
c. Swine
d. Sheep
e. Poultry

12. Grading and marketing
13. Planning and constructing needed farm buildings

A Summary of a Survey of the Employment Opportunities and Competencies Required for Entry in Selected Occupations in Agricultural Businesses in Three Communities in New York State, 1964.

New York State Education Dept., Albany

Apr65

DOCUMENT NOT AVAILABLE FROM EDRS 19p.

*OCCUPATIONAL SURVEYS, *OFF FARM AGRICULTURAL OCCUPATIONS, AGRICULTURAL SKILLS, EMPLOYMENT LEVEL, EMPLOYMENT STATISTICS, *EMPLOYMENT OPPORTUNITIES, BUSINESS SKILLS, *OCCUPATIONAL CLUSTERS, PART TIME JOBS,

New York,

A responsible person in each of 57 firms representing 24 types of business establishments was interviewed in order to identify job levels, numbers of employees, estimates of future openings, and employee traits and qualifications for off-farm agricultural occupations which involved both agricultural and business or distributive competencies. The occupations were grouped by "Dictionary of Occupational Titles" code numbers under eight occupational families related to agriculture. There were 509 full-time employees and 162 part-time employees identified. Only 20 of the firms estimated annual employment needs. These were 40 full-time and 35 part-time persons for replacement and new positions. Employers listed 14 personal traits, such as "ability to meet the public," and 13 competencies, such as "knowledge of farm products and markets" needed by sales workers and managers. (EM)

A Summary of a Survey of the Employment Opportunities and Competencies Required for Entry in Selected Occupations in Agricultural Businesses in Three Communities in New York State, 1964

Background:

For several years there has been a concern among agricultural educators as to how best to meet the training needs of youth who are preparing to enter various occupations in the so-called agricultural business field. Several states, notably California, Illinois, Kentucky, North Carolina, and Pennsylvania, have recently introduced experimental or pilot programs designed to provide youth not only with skills and knowledge about various aspects of agriculture, but with sales, marketing and distribution competencies as well. Presumably such youth would readily find employment in the rapidly expanding sales and services firms which serve agriculture.

The number and the importance of the opportunities which exist for persons with competencies in both agricultural and business skills is demonstrated by examination of the working force of the New York City Department of Markets. The arm of municipal government which has many market administration, supervision, inspection, and consumer education functions has over 350 employees which may be classified into five major groups: administrative; clerical-office; inspectional; technical and laboring. According to the Commissioner, who heads the department, "competency in agriculture" is related to the work performed by all of these workers.

Beginning in 1961 a committee composed of New York teachers of agriculture and agricultural businessmen studied the matter of providing such instruction and published suggestions for providing a course in training for related agricultural occupations and suggested a program which provided courses in agriculture and in business education.[1] Recent developments, not the least of which was the enactment of the Federal Vocational Education Act of 1963, have led to further explorations as how best to meet these training needs.

At a joint meeting of the Bureau of Agricultural Education and the Bureau of Business and Distributive Education held in January 1964, discussions were held which led to the establishment of a joint curriculum development project of the two bureaus. The purpose of the project was to explore the ways and means by which the two bureaus could formulate either new joint courses or units of instruction which could be included in existing courses supervised by the two bureaus.

Dr. E. John Gradoni and Frank Wolff were designated as representatives of the Bureau of Business and Distributive Education and the Bureau of Agricultural Education, respectively, for planning and coordinating this joint curriculum development venture. As a first step, it was determined that a survey would be conducted jointly by teachers of agriculture and distributive education coordinators in each of three communities in the state of employers needs regarding required or desirable competencies of entry workers in various occupations.

[1] Agriculture for Related Occupations. The University of the State of New York, The State Education Department, Bureau of Agricultural Education, Albany, N.Y., 1963.

Methods:

1. A list was made of the communities in which both a teacher of agriculture and a distributive education coordinator were employed. It was found that excluding New York City, approximately twelve such communities existed.

2. From the list of communities, three, Medina, North Syracuse, and Springville were selected because of the interest of the teachers of agriculture and distributive education coordinators in the project. The teachers of agriculture and distributive education coordinators who participated in the project were:

Community	Teacher of Agriculture	Distributive Education Coordinator
Medina	Harvey Lyndaker	Erwin Horowitz
North Syracuse	Donald Watson	Edwin Warren
Springville	Paul Emerling	Ercel Kayes

3. A meeting of the six persons named above and the representatives of the two bureaus was held for the purpose of outlining the project, briefing the interviewers and designing a survey instrument.

4. The following guidelines were established for the operation of the project:

a. In each community the agriculture teacher and distributive education coordinator would select a minimum of 20 firms and/or agencies engaged in agricultural business.

b. In selecting firms and/or agencies, no limitations would be imposed other than to insure that in the minds of the interview team that presumably entry workers in at least some of the occupations in the firm would require competencies in both agriculture and in distributive education. ("Agriculture" for the purposes of the project was defined as being that family of occupations involving the production, sales, marketing and distribution of food and ornamental produce and including the various services provided to agricultural producers and consumers.)

c. An attempt would be made by each interview team to get firms and agencies in the community sample which were representative of the agricultural business enterprises of the area.

d. Each team would, working together, interview a responsible person in each selected firm and/or agency for the purpose of determining:

(1) Identifying data - including the name, address, business territory served, main agricultural-business functions, etc.

(2) The numbers of employees, both full-time and part-time, who were classified as permanent or temporary (seasonal) workers.

(3) By job titles, the numbers of full-time and part-time employees, the level of employment, and the estimated numbers of permanent replacements needed annually.

(4) For each job title, the desired qualifications for entering the occupation and the knowledges, skills and personality traits desired of the prospective employee.

e. The teams would record the data, collect it and send it to the State Education Department for summarization and interpretation.

Findings

A total of 61 firms and/or agencies were included in the sample 20, 22 and 19 from Medina, North Syracuse and Springville, respectively. Four of these - two that were automobile dealerships and two that were general and/or building contractors were eliminated from further consideration as they were not classified as "agricultural" employers as previously defined.

The 57 remaining firms represented 24 types of business establishments. Table I shows the type and total number of establishments included in the sample arranged according to seven agricultural occupational families. A variety of retail and wholesale businesses and service establishments were represented. The table also shows the total number of full-time employees found in each type of firm and/or agency.

Table I. Types and Number of Firms and/or Agencies Included in the Three-Community Sample and Numbers of Full-Time Employees in Each Type

Type of Firm or Agency	Number of Firms or Agencies	Total No. Full-Time Employees
A. Agricultural Machinery Sales & Service		
Farm Equipment Dealers	8	62
B. Agricultural Supplies & Equipment		
Retail Feed and Farm Supplies (sales)	3	21
Feed Manufacturing and Retail Sales	4	23

sub total	9	144
C. Dairy Manufacturing, Processing and Sales		
Dairy Products Manufacturing and Retail Sales	3	37
Dairy Products Manufacturing	1	27
sub total	4	64
D. Agricultural Sales & Services (not elsewhere classified)		
Artificial Breeding Services	2	3
Cold Storage Plant	2	7**
Animal Hospitals	2	3
Retail Lumber Sales	1	9
Retail Fuel Dealer	1	7
Commercial Bank	1	13
sub total	9	42

Type of Firm or Agency	Number of Firms or Agencies	Total No. Full-Time Employees
E. Ornamental Horticulture, Production Sales & Services		
Flower Growers, Wholesale and/or Retail Sales	4	26
Retail and Wholesale Florists	2	6
Wholesale Floral Supply	1	13
Retail Nursery Sales and Landscaping Services	3	9
Landscaping Maintenance Services	2	4
sub total	12	58
F. Food Products Production, Processing & Wholesaling (other than dairy)		
Fruit and Vegetable Processing	3	46***
Custom Fruit Harvesting and Marketing	1	11
Wholesale and/or Retail Auction Sales	2	25
Egg and Poultry Dealers (wholesale)	1	6
Vegetable and Livestock Farm	1	19
sub total	8	107
G. Retail Food Sales		
Retail Food Stores	5	25
Retail Fruit and Vegetable Stores	2	7
sub total	7	32
Grand Total	57	509

***In 2 firms, supervisory personnel only were reported. Production workers were not included.

**In 1 firm, managerial and workers only were reported. Other workers were not included.

*Managerial, professional and sales workers only were reported. Manufacturing and clerical workers were not included in either of the two firms.

Tables II, III, IV, V, and VI, contain summaries of the data regarding the number and types of full-time workers found in the 57 firms and/or agencies in the sample. For each job title the Dictionary of Occupational Titles code number is given for the convenience of persons interested in descriptions of the work performed in each case.

The interviewers asked the employers or their representatives to rate each job title in terms of level of employment into one or more of the following groups: professional, technical, managers, foremen, clerical, sales, skilled, semi-skilled, and unskilled. An average or composite of the employers ratings regarding level of employment is also contained in these tables.

The numbers of workers found were classified into the seven agricultural occupational families as listed in Table I. This was done for the purpose of showing the spread or lack of it which specific jobs showed in regard to the various families of agricultural occupations. Consideration of this type of data should provide some clues as to the likely employment outlets for the various jobs.

For the purpose of convenience in presenting the data, separate tables are used to group the jobs according to Dictionary of Occupational Titles major groups or divisions. These are arranged as follows:

Professional and Managerial Occupations	-	Table II
Clerical and Sales Occupations	-	Table III
Service and Agricultural Occupations	-	Table IV
Skilled Occupations	-	Table V
Semi-skilled and Unskilled occupations	-	Table VI

The data for part-time workers is reported separately in Tables VII (Clerical and Sales Occupations); VIII (Service and Agricultural Occupations); and IX (Skilled; Semi-skilled and Unskilled Occupations). There were no part-time jobs reported in the Professional and Managerial DOT occupations group.

"Part-time" workers are both those who are employed throughout the year but work less than a full number of hours a day and/or less than a full week, and those who work full-time in terms of hours per day or days per week but who work only seasonally, (that is, less than a full year).

The interviewers were asked to estimate the number of replacements that they needed annually and the estimated number of increased employees needed annually. The survey teams found some employers reluctant to give this information and in the opinion of the investigators, the estimates made by the employers were conservative. Only 20 employers estimated that among them there would be an annual need for 40 full-time and 35 part-time employees for replacement of existing employees or to fill new positions. The remaining firms indicated no needs for replacement or additional employees at the time of the survey.

The survey teams asked the person responding in each case to comment on the qualifications that were desired of applicants in order to enter the occupation. This included the minimum entry age and the minimum educational grade level preferred. No summary was made of the responses given to these two questions. In addition, the interviewers were asked to list the "knowledges, skills and personality traits" desired of new employees. This information was secured for each job title found in the firm or agency.

It was decided to make a detailed analysis and summary of the desired traits and competencies required to obtain employment in the group of jobs known as sales occupations. This group was selected for detailed analysis for the following reasons:

1. Agricultural sales occupations were found in all seven of the agricultural occupational family groups.

2. These occupations comprise those which are of most concern to both agricultural educators and distributive education coordinators regarding the design of courses of study to meet training needs in them.

3. The agricultural sales workers represented one of the larger groups of workers found in the survey.

Table X contains a rank order summary, first of the desired personal traits and second of the desired business and other competencies for gaining employment as entry workers in agricultural sales and sales related occupations. Thirty-eight of the 57 firms employed such workers.

Table X. Rank Order of Personal Traits and Business and Other Competencies Which Are Desirable For Gaining Employment as Sales Workers According to 38 Employers Who Hire Such Workers

Personal Traits	
Ability to:	
Meet the public	33
Have a good attitude toward customers, fellow workers, supervisors	26
Maintain a good personal appearance	13
Be honest	10
Be conscientious, attentive at work	10
Keep employers interests in mind	8
Accept and carry out responsibilities	5
Follow instructions	4

Drive a car or truck safely	3
Be neat in work habits	3
Write legibly	3
Be prompt in reporting for work	1
Have patience	1
Have physical strength	1

Business and Other Competencies

Knowledge of products and/or markets	28
Selling abilities (including telephone procedures)	26
Knowledge of farming operations	26
Make mathematical calculations accurately	20
Keep records accurately	11
Training in agriculture required	8
Use communication skills effectively	7
Must have mechanical aptitudes; abilities	7
Knowledge of display and merchandising techniques	6
Training in sales techniques required	4
Care for materials, tools, products, etc.	4
Direct and supervise others	2
Know-how to file	1

The items appearing among the highest in the ranking for personal traits were the abilities to: (1) meet the public, (2) have good attitudes, and (3) maintain a good personal appearance. Similarly, those business and other competencies most frequently mentioned included (1) knowledge of farm products and/or agricultural marketing procedures; (2) knowledge of farming operations; and, (3) the ability to "sell."

A similar analysis was made for 17 firms from the first five agricultural occupational families who gave information for managers and assistant managers. Table XI shows a rank order of both personal traits and business and other competencies for managerial positions because presumably these are the positions that entry workers aspire to attain after having suitable experience, background and training. The 17 firms comprised, five in the Agricultural Machinery Sales and Service family; four in the Agricultural Supplies and Equipment family; two in the Dairy Manufacturing, Processing and Sales family; three in the Agricultural Sales and Services (not elsewhere classified) family; and three in the Ornamental Horticulture Production Sales and Services family. The other agricultural occupational families were not included in Table XI. They are the Food Products Production Processing and Wholesaling (other than dairy) and the Retail Food Sales Families.

The items appearing among the highest in the ranking for personal traits were the abilities to: (1) meet and deal with people; (2) be sympathetic, understanding and communicative with farmers and (3) to manage and plan. Similarly, those business and other competencies ranking the highest were: (1) knowledge of the business and/or products; (2) selling abilities; and (3) record keeping abilities.

A comparison of Tables X and XI indicates that insofar as desirable traits for entry level sales occupations and managerial positions, there is a high degree of similarity. There is also apparently a high degree of similarity regarding the business and other competencies desired of both sales workers and managers.

Table XI. Rank Order of Personal Traits and Business and Other Competencies Which Are Desired for Managers of 17 Agricultural Businesses

Personal Traits	
Ability to meet and deal with people	17
Ability to be sympathetic, understanding and communicative with farmers	10
Managerial ability including planning ability	8
Mechanical aptitudes and abilities	5
Ability to make a good personal appearance	3
Ambitious	3
Be willing and able to accept responsibility	3
Honesty	1
Be active in community activities	1

Business and Other Competencies	
Knowledge of the business and/or products	17
Selling ability	15
Record keeping ability	12
Ability to hire, supervise and train employees	12
Knowledge of farming operations or a background in agriculture	11
Ability to figure contracts and other computational skills	11
Ability to use price books, set prices, figure margin, etc	7
Merchandising skills	5
Knowledge of and ability to use advertising skills	5
Knowledge of inventory and stock control procedures	5
Reading, writing and other communications skills	4
Knowledge of credit and be able to extend it wisely	3
Business training essential	2
Knowledge of market research	1
Knowledge of filing	1

Summary

1. Fifty-seven firms and/or agencies representing 24 rather distinct businesses and covering seven agricultural occupational families were included in the sample.

2. Investigation revealed the following regarding the number and percentage of full-time and part-time workers found by agricultural occupational families:

	Full-time		Part-time	
	No. of Workers	Percent	No. of Workers	Percent
Agricultural Machinery Sales and Service	62	12.2	10	6.2
Agricultural Supplies and Equipment	144	28.3	6	3.7
Dairy Manufacturing, Processing and Sales	64	12.5	10	6.2
Agricultural Sales and Services (not elsewhere classified)	42	8.3	6	3.7
Ornamental Horticulture Production, Sales and Service	58	11.4	31	19.0
Food Products Production, Processing and Wholesaling	107	21.0	70	43.2
Retail Food Sales	32	6.3	29	18.0
Total	509	100.0	162	100.0

3. The number and percentage of full-time workers classified according to Dictionary of Occupational Titles major groups or divisions is summarized as follows:

	Full-Time		Part-Time	
Occupational Group	No. of Workers	Percent	No. of Workers	Percent
Professional and Managerial	155	30.5	0	0.0
Clerical and Sales	104	20.4	30	18.5
Service and Agricultural	85	16.7	96	59.3
Skilled	42	8.3	8	4.9
Semi-skilled and Unskilled	123	24.1	28	17.3
Total	509	100.0	162	100.0

4. Twenty of the 57 employers who responded to the question indicated that among them there was an estimated annual need for 40 full-time and 35 part-time employees.

5. Thirty-eight employers who hired sales workers ranked the following personal traits as the three highest desired of applicants: (1) the ability to meet the public, (2) the ability to have good attitudes; and (3) the ability to maintain a good personal appearance. They also ranked desired business and other competencies as follows: (1) knowledge of farm products and/or agricultural marketing procedures; (2) knowledge of farming operations; and (3) the ability to "sell."

6. Seventeen employers who responded to similar questions regarding desired traits and competencies for managers rated several factors in the same way as did the group for sales workers.

Report on a Study of Student Interests in Five Agricultural Occupations Groups, Three Areas of New York State.

Noakes, Harold L.

New York State Educ. Dept., Albany. Bur. of Agr. Educ.

65

EDRS Price MF-$0.09 HC-$0.28 7p.

HIGH SCHOOL STUDENTS, *AGRICULTURAL OCCUPATIONS, *VOCATIONAL INTERESTS, VOCATIONAL AGRICULTURE, STUDENT ENROLLMENT, SEX (CHARACTERISTICS),

New York,

During 1964-65, questionnaires were given to 6,706 students in grades 8-10 to ascertain their interest in preparation for agricultural occupations. Students from 13 schools which offered agriculture courses, and nine which did not, were asked to indicate their interest in agricultural activities and their choice of the following -- (1) agricultural machinery and mechanics, (2) agricultural sales and service, (3) farm work, operation and management, (4) ornamental horticulture, landscaping and floriculture, (5) conservation, forestry, and campsite activities, or (6) no interest. An agricultural occupation group was selected as first choice by 2,521 of the boys and 1,658 of the girls. First choices of boys were conservation, agricultural mechanization, farm operation and management, ornamental horticulture, and agricultural business, in that order. First choices of girls were ornamental horticulture, conservation, farm operation and management, agricultural business, and agricultural mechanics, in that order. From this data, enrollments in agricultural courses were projected. (EM)

REPORT ON A STUDY OF STUDENT INTERESTS IN FIVE AGRICULTURAL OCCUPATIONS GROUPS

THREE AREAS OF NEW YORK STATE
1965

Dr. Harold L. Noakes, Associate
Bureau of Agricultural Education

During the 1964 - 1965 year, studies have been made in a number of school districts to determine the interest of students in preparing for agricultural occupations. These studies have been conducted under the direction of district, city and village superintendents of schools in cooperation with local school administrators. The Bureau of Agricultural Education has provided guidance in conducting such studies including the tabulation and analysis of data and making recommendations for program development.

The primary purpose of such studies has been to provide data which can be used as a basis of instituting and/or modifying agricultural programs to more effectively meet present and future needs.

Following is a report of a study conducted in three areas of New York State which include data from twenty-two schools. These areas include twelve schools in Oneida-Madison Counties, seven schools in Jefferson County and three schools in Columbia County.

Schools included in the study are as follows:

<u>Oneida-Madison Counties</u>

Bridgewater	New York Mills
Brookfield	Oriskany
Chadwicks	Sauquoit Valley
Clinton	Waterville
Leonardsville	Whitesboro
New Hartford	

<u>Jefferson County</u>

Clayton	Mannsville-Manor
General Brown	Hounsfield
Henderson	Watertown
Lyme	

VT00482

Columbia County

Chatham
Icabod Crane
New Lebanon

Agricultural programs now serve ten of the Oneida-Madison County schools studied, none of the Jefferson County schools studied and all of the Columbia County schools studied.

All students in grades 8, 9, and 10 were requested to complete a questionnaire indicating their interest in agricultural activities and choice of occupational families in agriculture. They were also provided an opportunity to indicate no interest in agricultural occupations.

The five occupational areas included Agricultural Machinery and Mechanics; Agricultural Sales and Service; Farm Work, Operation and Management; Ornamental Horticulture, Landscaping and Floriculture; and Conservation, Forestry and Campsite Activities.

A total of over 6700 boys and girls completed these questionnaires. Over 1600 indicated a first choice in one of the agricultural occupation groups.

These studies reveal that a significant number of students are interested in enrolling in agricultural courses provided that a variety of courses are available. It is well to note that agricultural courses are presently not available in nine schools studied. Over thirty-seven percent of the 6706 students studied indicated an interest in one or more occupational groups in the broad field of agriculture. Table 1 gives an overall picture of this interest.

TABLE 1

A Summary of Students Surveyed and the Number Interested in One or More Agricultural Occupation Groups - Three Areas of New York State - 1965

	Students Surveyed	Students Indicating 1st Choice in Agriculture			
		B	G	Total	%
12 Oneida-Madison County Schools	3611	887	508	1395	38.7
7 Jefferson County Schools	2265	573	269	842	37.2
3 Columbia County Schools	830	198	86	284	34.3
TOTAL	6706	2521	1658	863	37.6

Among the first choices of occupational groups, boys consistently placed Conservation, first; Agricultural Mechanization, second; Farm Operation and Management, third; Ornamental Horticulture, fourth; and Agricultural Business, fifth.

Girls on the other hand, tended to rank Ornamental Horticulture, first; Conservation, second; Farm Operation and Management, third; Agricultural Business, fourth; and Agricultural Mechanics, fifth.

Figure 1, shows graphically the first choice of student interest in agricultural occupation groups.

In interpreting the data, factors were applied to provide a conservative estimate of the actual enrollment which could be anticipated in the various courses. These factors are based on previous experience and the best judgment of those interpreting the data.

Following is an example of how data is tabulated and enrollments in agricultural courses projected.

SAMPLE CENTRAL SCHOOL

1965

TABLE 2

First Choice of Students Interested in Agricultural Occupations

	8		9		10		Total	
	B	G	B	G	B	G	B	G

Orn. Hort.	1	2	3	2	5	7
Conservation	3	1	4	4	1	5
Agr. Bus.	-	-	-	-	-	-
TOTAL	35	5	40	44	10	54

The above tables illustrate the need for agricultural programs serving an area larger than a single school district. In the above school there is sufficient potential enrollment to warrant the offering of Agriculture 1 and 2. Students interested in the other agricultural courses should be transported to a convenient center for such instruction.

It is anticipated that if such centers are established, that in schools where there is sufficient enrollment in agricultural courses and facilities available, that the individual schools would offer such instruction. Where enrollments are small, such as in specialized agricultural courses, students would be transported to a center for instruction.

This would bring about efficiencies in instruction and use of facilities. In addition, it would make possible the offering of specialized courses in Conservation, Ornamental Horticulture, Agricultural Mechanization, Agricultural Business, and Farm Production and Management.

It is recommended that an instructional program be established to serve the needs of out-of-school youth employed in farming and off-farm agricultural occupations. This instruction would be carried on throughout the year.

The training programs in agriculture are needed to meet the expanding demand for off-farm workers in the broad field of agriculture as well as to continue to train farm operators and managers for our farms.

LIST OF SELECTED PUBLICATIONS PERTAINING TO TEACHING AGRICULTURAL OCCUPATIONS

I. Occupational Briefs, Monographs and Abstracts

A. Bellman Publishing Company, P.O. Box 172, Cambridge 38, Massachusetts.

A publisher of vocational and professional careers monographs, the following are appropriate to agriculture. The price for a single copy of each is $1.00 and they vary in length from 17-23 pages.

Number	Title	Date Published
4	The Seed Industry	1946
8	Forestry	1957
46	The Meat Packing Industry	1954
83	The Dairy Industry	1955
95	The Poultry Industry	1958
99	The Canning Industry	1959

B. Chronicle Guidance Publications, Inc., Moravia, New York

This firm has published a total of 285 occupational briefs in accordance with the standards recommended by the National Vocational Guidance Association. Each brief, either 4 or 8 pages in length, provides the following information: work performed and working conditions, personal qualifications required, training requirements, training opportunities, job outlook, methods of entry, earnings, related jobs, etc. Each brief is coded with the numbering system used in the Dictionary of Occupational Titles.

More than 25 briefs refer to agricultural occupations and several others are of general interest. Additional titles are added each year and current ones are periodically revised and reprinted. An annual subscription service is also available. Prices are as follows for single copies: 4-page brief, $.35 each - 8-page brief, $.50 each. (Eight-page briefs are starred (*) in the lists below.)

Briefs Relating to Agricultural Occupations:

Over 100 1-2 page occupational abstracts are available from this firm. Each abstract is a composite summary of available literature in several references. The material is organized into the following categories: nature of the work, qualifications, preparation, entrance and advancement, advantages and disadvantages, earnings, related occupations, etc. The abstracts are coded according to the Dictionary of Occupational Titles.

Single copies of each of the following abstracts dealing with agricultural occupations are available for $.50 with reduced prices for quantity orders.

Title	Date Published
Agronomist	1960
Dairy Farmer	1958
Florist (Rev.)	1962
Poultry Farmer	1955
Veterinary Doctor	1960

D. Science Research Associates, Inc., 259 East Erie Street, Chicago 11, Illinois.

A large publisher of materials of instruction, tests and guidance publications, SRA has available 360 Occupational briefs. Each illustrated, four-page brief provides a description of a specific occupation, including qualifications, training required, earnings, furture outlook, etc. along with selected references for follow-up research.

Single copy prices are $.35 with discounts when purchased in quantities either all of the same title or assorted. Those available dealing with agricultural and kindred occupations are:

In addition, SRA publishes a series of 16 Job Family Booklets. Two of these are appropriate to agriculture: #5-604GK - Jobs in Outdoor Work and 5-964GK - Jobs in Agriculture. Each booklet in this series is 32 pages, paperbound, measuring 7" x 9½" and costs $1.00.

E. The Institute for Research, 537 South Dearborn Street, Chicago 5, Illinois.

This organization publishes about 300 career monographs covering 1900 jobs. The publications give a report of detailed nation-wide research on a field of endeavor. Each monograph is 8½" x 11" in size, illustrated, and arranged two columns to the page. Topics covered include a description of the field, personal qualifications, education, and training, earnings, opportunities, how to get started, related fields, etc. The monographs cost $.95 each with discounts in quantities either mixed or of the same title. Those pertaining to agriculture are:

Catalog No.	Title
3	Careers in the Biological Sciences
13	Landscaping Architecture as a Career
20	Agricultural Science and Modern Farming
23	Forestry As A Career
53	Farm Management as a Career
63	Flower Shop Management as a Career
71	Veterinary Medicine as a Career
79	Dairy Farming as a Career
80	Careers in the Dairy Products Industry
152	Agricultural Engineering as a Career
155	Fur Farming as a Career
160	A Career as a County Agricultural Agent
166	Beef Cattle Raising as a Career
170	Poultry Farming as a Career
175	Vegetable Farming as a Career
203	A Career as a Food Chemist
204	Botany as a Career
210	Research Careers in Agriculture
242	Careers in the U.S. Department of Agriculture
245	Farm Equipment Dealership Sales and Service Careers
254	Careers in Federal and State Fish and Wildlife Service
258	Careers in the U.S. Department of Interior
291	Careers in Food Products Distribution

F. Vocational Guidance Manuals, 800 Second Avenue, New York 17, New York.

The Career Series of Manuals are paper bound books designed to provide youth with the information needed to choose and plan careers. Written by recognized authorities, each covers in detail the following information: history, importance and outlook, attributes necessary, salaries, educational preparation, advantages and disadvantages, duties, working conditions, etc.

The cost of each of these manuals is $1.45 with special school and quantity discounts. Titles in the series of agricultural interest are:

Agricultural Engineering
Forestry
Horticulture
Landscape Architecture
Poultry Industry

II. Other Commercial Publishers of Career Materials.

1. Careers, Box 522, Largo, Florida.
2. Commonwealth Book Co., 80 East Jackson Street, Chicago, Illinois (vocational guidance monograph series).
3. Hoards Dairymen, Fort Atkinson, Wisconsin, $0.75 each. "Choose Your Career in Agriculture" - a description of 48 careers in agriculture each written by workers in the field.
4. Interstate Printers and Publishers, Inc., 19-27 North Jackson Street, Danville, Illinois.

   "Handbook of Agricultural Occupations", Norman K. Hoover - one of the most comprehensive and up-to-date works of its kind. It describes the opportunities, etc. for on-farm and 55 typical off-farm occupations. 1963, 254 pp., list price $4.75.

   "Guidance in Agricultural Education", Harold M. Byram - discusses the role of the agriculture teacher in guidance work. Chapter 3 - is especially useful in providing background for teaching about agricultural occupations, 1959. 238 pp., list price, $4.75.

   "Agriculture in Our Lives", George P. Deyoe - a good test for becoming acquainted with agriculture. Chapter 4 - gives a good overview and examples of careers in agriculture. 1956, 638 pp., list price, $4.75.

   "Your Opportunities in Vocational Agriculture", Lloyd J. Phipps - a basic text on an introduction to vocational agriculture. Career information is oriented primarily to farming in Chapter 3 with only a brief mention of related occupations. 1957, 175 pp., list price, $3.25.

   "Charts of Agricultural Occupations" - H. M. Byram - a set of 3 charts: (1) Occupations in Agricultural Production, (2) Occupations in Agricultural Business, (3) Agricultural Professions - which graphically present some 84 agricultural occupations. Set of 3 charts, $2.50.

5. Occupational Index, Inc., New York University, Washington Square, New York 3, New York
6. Research Publishing Co., Inc., P.O. Box 245, Boston 1, Massachusetts.
7. World Trade Academy Press, 3 East 48th Street, New York 17, New York.

III. Other occupational materials

1. Agricultural Commission, The American Bankers Association, 12 East 36th Street, New York 16, New York.
   "Agriculturally Trained Men in Banking," 1959, $.50.

2. American Forestry Association, 919 17th Street, N. W., Washington, D. C.
   "Men Wanted" - a career reprint for prospective foresters, 29 pp. free.

3. American Institute of Cooperation, 1616 8th Street, N. W., Washington, D. C.
   "Careers in Agriculture," free.

4. American Society for Agricultural Engineers, 428 Main Street, Saint Joseph, Michigan.
   "Agricultural Engineering, A Challenging Career," 6 pp., free.
   "Agricultural Engineering as a Professional Career," 8 pp., free.

5. American Society of Agronomy, 2702 Monroe Street, Madison 5, Wisconsin.
   "Your Career in Agronomy," 12 pp. free.

6. American Society of Landscape Architects, 9 Park Street, Boston 8, Massachusetts.
   "Landscape Architecture as a Future Life Work," 1953, 2 pp., free.

7. American Veterinary Medical Association, 600 South Michigan Avenue, Chicago, 5, Illinois.
   "Veterinary Medicine as a Career," free.

8. B. F. Goodrich Company, 500 South Main Street, Akron 18, Ohio.
   "Tommy Looks at Farming," free.

9. Committee on Poultry Careers for the Poultry Science Association, C. B. Ryan, Secretary, Texas A & M College, College Station, Texas.
   "Find Your Career in the Poultry Industry," 45 pp., free. - describes the opportunities for people with poultry science training in various industries.

10. Cooperative Grange League Federation Exchange, Inc., Ithaca, New York.
    "Careers in Agriculture, GLF," free.

11. Entomological Society of America, 1530 P Street, S. W., Washington 5, D. C.
    "Opportunities in Professional Entomology," brochure No. 1, $.15.

12. General Electric Company, Educational Relations Service, 1 River Road, Schenectady 5, New York.
    "Start Planning Your Career Now," 7 pp. free.

13. Institute of Food Technologists, 176 West Adams Street, Chicago 3, Illinois.
    "Food Industry Workers in Food Technology," free.

14. International Harvester Company, Inc., Educational and Personnel Department, 180 N. Michigan Avenue, Chicago 1, Illinois.
    "Career Opportunities After Graduation," 1958 70 pp., free.

15. National Association of Manufacturers, Educational Department, 2 East 48th Street, New York 17, New York
"Your Future Is What You Make It," free.

16. National Sales Executives, Inc., 630 Third Avenue, New York 17, New York
"There's a Future in Your Farm Background," 1958, 45 pp. free. - points out the opportunities in the field of selling to farmers.

17. New York Life Insurance Company, Career Information Service, Box 51, Madison Square Station, New York 10, New York

A. Career Opportunities - a pocketbook compilation of nearly 60 4" x 6" occupational articles - pp. 397, softbound, free. included are:
"Should You be a Farmer?"
"Should You be a Forester?"
"Should You be a Public Servant?"
"Should You be a Biologist?"
"Should You be a Veterinarian?"

B. Each of the above is also available as a separate booklet, 4" x 6", 12 pp., illustrated, free.

18. New York State Conservation Department, State Campus, Albany, New York.

The following information leaflets, which are reprints from the Department's official magazine - "The New York State Conservationist" deal with careers in conservation. They are available in single copies, free from the Department.

"Careers in Soil and Water Conservation"
"Careers in Outdoor Recreation"
"Careers in Conservation Education"
"Forestry as a Career"

19. Society of American Florists, Sheraton Park Hotel, Washington 8, D. C.
"Florist Industry as a Career," 12 pp. free.

20. State University of New York, College of Forestry, Syracuse University, Syracuse, New York
"What Foresters Do," free.

21. The American Society for Horticultural Science, Michigan State University, East Lansing, Michigan.
"Horticulture, A Challenging Career," 1958, 8 pp., free.

22. The Council on Opportunities in Selling, Inc., 630 Third Avenue, New York 17, New York
"Opportunities in Selling," 1963, 22 pp., single copy free to students and teachers.

23. The Guidance Center, Ontario College of Education, University of Toronto, Toronto 5, Ontario, CANADA.
"General Farmer," 1959, 4 pp. $.13.
"Beekeeper," 1959, 4 pp. $.13.
"Florist," 1952, 4 pp. $15.

24. The American Nurseryman, 343 South Dearborn Street, Chicago 4, Illinois "Beginning in the Nursery Business," 1958, 64 pp. $1.00.

IV. Material available from the Federal Government

A. Superintendent of Documents, Government Printing Office, Washington, D.C.

1. Occupational Outlook Handbook, 1963-1964 edition, price $4.50 (employment information on major occupations for use in guidance)

2. Separate report from the Handbook
"Agricultural Occupations," Bulletin No. 1255-2, price $.20.
"Foresters," Bulletin No. 1215-38, price $.05.

3. Occupational Outlook Quarterly, $1.00 per year.

4. Occupational Briefs

A. "The Job of the Berry Farmer," No. 57, 1947, 12 pp. $.05.
B. "The Job of the Corn-Hog-Cattle Farmer," No. 55, 1947, 14 pp. $.05.
C. "The Job of the Dairy Farmer," No. 56, 1947, 14 pp. $.05.
D. "The Job of the Fruit Farmer," No. 59, 1947, 14 pp., $.05.
E. "The Job of the Poultry Farmer," No. 64, 1947, 13 pp. $.05.
F. "The Job of the Truck Farmer," No. 66, 1947, 13 pp. $.05.
G. "Agricultural Economist," No. 12, 1947, 14 pp. $.05.

5. "Starting and Managing a Small Business," Occupational Outlook Quarterly - $1.25.

6. "Establishing and Operating a Retail Feed and Farm Supply Store," Industrial Series No. 45., 38 pp., $.15.

7. "Dictionary of Occupational Titles," 2 volumes - currently a revision is being made of the previous edition and orders for this comprehensive list of occupations and descriptions should await announcement of the new edition.

8. "Careers in the United States Department of Interior, A Directory for College Students," $.25.

B. U. S. Employment Service, U. S. Department of Labor, Washington, D. C.
"Agricultural and Biological Services," Description of Professions series, pamphlet No. 1, 1948, 39 pp., free.

C. U. S. Department of Agriculture, Office of Information, Washington, D. C.

1. "Opportunities for Career Service in the U. S. Department of Agriculture, Miscellaneous Publication No. 675; 52 pp., $.25.

2. "Careers in the Soil Conservation Service," Miscellaneous Publication No. 717, free.

3. "Career Opportunities for Veterinarians in the Agriculture Research Service," Miscellaneous Publication No. 727, free.

4. "Scientific Careers in the Agricultural Research Service," Miscellaneous Publication No. 798, free.

5. "Careers in Forestry," Miscellaneous Publication No. 249, free.

6. "A Job with the Forest Service," free.

D. Fish and Wildlife Service, U. S. Department of Interior, Washington, D.C. "Opportunities in the Fish and Wildlife Service," 32 pp., free.

V. Materials available from the Bureau of Agricultural Education, State Education Department, Albany, New York 12224.

"Why Study Vocational Agriculture in High School" 34 pp., single copy free.

"How Agricultural Agencies and Organizations Serve the Farmer," 78 pp., single copy free.

VI. Materials available from the New York State College of Agriculture, Cornell University, Ithaca, New York.

A. <u>From the Admissions Office</u>

1. Several leaflets describing career opportunities at the college level in the several fields of agriculture including agronomy, agricultural engineering, agricultural economics, dairy industry, food technology, horticulture, plant science, poultry, etc., all free.

2. "Teaching Vocational Agriculture," free.

3. "I've Found my Future in Agriculture," a publication of the American Association of Land Grant Colleges and State Universities, free.

4. "A University Education in Agricultural Science," free.

5. "Agriculture at Cornell."

B. <u>From the Mailing Room</u>

1. "Choosing an Occupation," Miscellaneous Bulletin 45, 12 pp., free.

VII. Materials available from the Future Farmers' Supply Service, P. O. Box 1180, Alexandria, Virginia.

"Agriculture is More Than Farming," 22 pp., single copy $.15 - quantity discounts.

Further information can be obtained from the Bureau of Agricultural Education, The State Education Department, Albany, New York 12224.

*EDUCATIONAL RESEARCH, *EVALUATION, *GUIDELINES, *RESEARCH METHODOLOGY, *SPEECHES,

Principles providing a general framework for the evaluation of research are -- (1) Determine and clarify what is to be evaluated, (2) Select the evaluation technique in terms of the purpose to be served, (3) Consider more than one way of getting maximum yield out of the evaluations, (4) Know the limitations of evaluation techniques, and (5) Recognize that evaluation is a means to an end and not an end in itself. The recognized pitfalls are -- (1) bias, (2) noncomparable data, (3) uncritical projection of trends (overworking the data), (4) improper assumption regarding causation, (5) comparison with an abnormal base, (6) improper sampling, and (7) misuse of statistical methods. EVALUATION OF RESEARCH*

Dr. Virgil E. Christensen, Consultant, Research Design
The Center for Vocational and Technical Education, Ohio State University

First of all, I have made the assumption that our primary concern for evaluation this morning would be that of evaluating research efforts, per se, and not that of evaluating a total vocational education program.

My assignment at The Center for Vocational and Technical Education at Ohio State University is concerned with both aspects--that of assisting Center specialists and other research groups concerned with vocational and technical education in designing and developing their research ideas and also working on The Center's efforts in developing a model for use by states in evaluating their total efforts in vocational and technical education.

Allow me to present a few very general thoughts on the topic now and then possibly go into greater detail in our small group discussion session later this morning.

This will be sort of a "Heinz 57 variety" discussion of evaluation. The 57 stemming from my use of five principles and seven potential pitfalls in evaluation activities.

---

*Paper presented at Central Region Research Conference in Agricultural Education, University of Nebraska, Lincoln, August 2, 3, 4, 1966.

VT000513

THE FOLLOWING FIVE PRINCIPLES
PROVIDE A GENERAL FRAMEWORK
FOR THIS DISCUSSION

PRINCIPLE NO. 1 DETERMINE AND CLARIFY WHAT IT IS THAT IS TO BE EVALUATED

Mager, in his book on Preparing Instructional Objectives[1] points out that the correct stating of objectives is the key to evaluation. That the objective must be so written as to describe the intended outcome. That objectives should be so written as to tell you what the learner will be doing and under what conditions he will be doing it when he is doing what it is you expected him to be able to do. The objective, therefore, aids evaluation and evaluation in turn, contributes to the accomplishment of objectives.

To quote Mager, "an objective will communicate your intent to the degree you have described what the learner will be doing when demonstrating his achievement and how you will know when he is doing it."

Mager was of course referring to the writing of instructional objectives, however, what he says applies, at least in part, to the writing of research objectives.

In my opinion, more than half of the problems arising in evaluation stem from poorly thought out objectives, and many of the remaining problems arise in finding the right approach for assessing project outcomes.

Let me give you an example of a research proposal in which the objective and evaluation sections are so written as to create, rather than solve problems. This is a legitimate proposal recently submitted for funding; only the subject identification has been changed.

---

[1]Robert F. Mager, Preparing Instructional Objectives, Fearon Publishers, Palo Alto, California, 1962, p. 53.

OBJECTIVE: To prove that the best method of teaching _____ is by use of community resources and audiovisual aids that will make _____ attractive, interesting, and meaningful.

This is the one and only objective listed in this study.

Let's next move into the proposal to see how this researcher plans to carry out his evaluation, testing to see if he has achieved his stated objective.

"THE FOLLOWING CRITERIA WILL BE USED IN EVALUATING THIS EFFORT"

1. Is the program in keeping with what we know about good education?
2. Does it grow out of regular classroom activities?
3. Does it challenge the student's interests?
4. Will it take the student beyond his present knowledge into new and enriched experiences?
5. Does it give the student an opportunity to do creative work?
6. Will it cause the student to do critical thinking?
7. Will it cause the student to develop new, broader, and deeper interests?
8. Will it give the student new insights into new interests?
9. Will multiple skills and abilities be gained by carrying on this type of activity program?

Would you say this person is whipped before he begins? The sad part about it is that this kind of writing shows up in proposals day after day with field readers given little choice but to turn them down.

WHAT CAN THE
RESEARCHERS DO?

1. Decide what the purpose is of the evaluation before he decides on any particular approach to evaluation.
2. He can make a decision as to what is to be evaluated, <u>then</u> select the data collecting devices, instruments, etc.
3. Make a decision as to what is to be valued in the evaluation and why it is important.
4. Write objectives that can be evaluated.

PRINCIPLE NO. 2 <u>SELECT THE EVALUATION TECHNIQUE IN TERMS OF THE PURPOSE TO BE SERVED</u>

Too often the techniques of measurement used are selected on the basis of accessability rather than on how accurately they assess the most "potent variable" or describe the crucial criteria or key indicators in evaluation. Almost any technique has an appropriate use and purpose--finding the one that measures the most crucial factors in your research effort is worth searching out.

PRINCIPLE NO. 3 <u>CONSIDER MORE THAN ONE WAY OF GETTING MAXIMUM YIELD OUT OF THE EVALUATION</u>

Just as no one device or technique is adequate for measuring or determining all possible outcomes. I'm also convinced that many researchers stop short of a complete evaluation. They

stop before they have gleaned the maximum information from their evaluation activity. Let me use a simple illustration of this principle.

I read recently of a rather sophisticated bit of supermarket research where the primary objective was that of trying to figure out how to get more of the housewives' dollar and keep her happy in doing so. This study, by using a simple survey technique, found out that:

the average shopper spends 20-24 minutes in the store,
buys an average of 25 items,
spends between $11-16,
2/3rds of the average income shoppers don't have a list, while
50% of upper income people do;

31% of purchases are specifically planned,
50% of purchases were unplanned (impulse buying),
17% were thought about but not specifically planned,
2% are substitute items; } = 100%

69% of brand decisions are made at the instant of purchase
65% of egg purchases were planned
75% of purchases of scatter rugs, sponges, are unplanned.

Now the researcher could stop his analysis here, publish a report and it would all make for interesting reading. It tells a lot about the shopper, but it really doesn't tell much about how the store manager can get the shopper to spend more money, which was the original objective.

I'm happy to say that this research group didn't stop with just this descriptive report, but went on into a modified time and motion study observing the shoppers movements, second by second. From this, they found that:

10 seconds is all that is spent in buying laundry soap and most of this is spent in loading it into the cart,

3.6-4.3 minutes are spent in waiting to get checked out,

2 minutes are spent in shifting items about in the cart,

50 fixed eye contacts are made of products on the shelves.

These findings go on and on, but a few of these are sufficient to illustrate a point.

How did the researchers get multiple yield from their data? They did as follows:

1. If it takes her only 10 seconds to buy laundry soap, don't spend any money on this section, give it a fairly low priority corner or end of the aisle space.
2. Keep the high mark-up items at eye level--the shopper makes an average of only 50 fixed eye contacts--make every one count.
3. Capitalize on that 3-4 minute wait at the checkout counter. Stock this area with impulse items. Chewing gum and marshmellows are two of the best "impulse items".
4. Put the bread and soft fruit near the end of the shopping pattern--this will cut down on time spent shifting items in the cart and allow a few more eye contacts.
5. Keep the candy, cookies, and breakfast cereals high enough so that the kids in the cart can see them--this extra pair of eyes increases your total number of eye contacts.

These researchers milked every idea they could from the data and it is paying dollar dividends.

How about some of our job competency studies in agricultural education? Are we getting maximum yield from them--or do we evaluate too grossly? I'm convinced that many of these studies settled for too little information. Wouldn't it help us to know more about the critical 10 seconds or 10 minutes in a workers application of skills? Or what is the best traffic pattern for teaching the "cluster skills"? This whole idea borders on the critical incidence technique now receiving increased attention in a number of educational research efforts.

PRINCIPLE NO. 4 KNOW THE LIMITATIONS OF EVALUATION TECHNIQUES

I'll skip over this area rather quickly, because the limitations are discussed more completely under the pitfalls section of this paper. There are, however, three factors to keep in mind here:

1. That even our best educational measuring instruments fall short on the amount of precision we would like to have.
2. That much of evaluation depends upon interpretation of meaning and is thus subject to many human errors.
3. That a healthy awareness of the limitations should encourage the use of more than a single evaluation technique.

PRINCIPLE NO. 5 EVALUATION IS A MEANS TO AN END AND NOT AN END IN ITSELF

This, of course, is another version of the old and often repeated statement that evaluation to be effective must be continuous.

If the research effort has been worthwhile doing and if the evaluation points out anything either positive or negative--you haven't completed the task if you stop there.

Get the results into action programs or into decision making places.

Use the results in structuring subsequent research plans.

Walter Finke, President of Electronics Data Processing Division of Honeywell, says:

> "... information is the last great frontier of man. Diligently gathered it will fill gaping holes in man's body of knowledge. Carefully organized, it can serve virtually any human discipline. Readily available, it can be marshalled at the time decisions are to be made, rather than days, weeks, or months later. Properly used, it can indeed become a deliverance from human ignorance and lack of knowledge."

We are approaching a period of time when the results from research will be fed quickly into information retrieval systems and available to all--<u>but</u>, all the information retrieval systems and piles of abstracts aren't going to be worth the microfilm they're printed on if the evaluation wasn't carried out right in the first place.

There are undoubtedly many other principles that could be added to the five presented, but let me go on to a brief discussion of seven recognized evaluation pitfalls.

PITFALL NO. 1 <u>BIAS</u>

This is one of the most prevalent pitfalls.

It is difficult for any researcher to maintain complete objectivity--to put aside his preconceived ideas on the issue, but let's face it there is sufficient flexibility possible in the treatment of most data to influence almost any finding.

Too often evaluations are completed, decisions are made and most of it based on preconceived ideas. Statistics are used only as a pretence that the decisions reached had a sound and logical base. I'm not suggesting that the data in some studies are changed, rather it is the interpretation of the findings that undergoes mass manipulation in order to put forth the "right answer".

There is a saying which says: "There is no process of amalgamation by which opinions, wrong individually can become right merely by their multitude."

So is it also with research data, there is no process of "computerization" whereby data, wrong in the first place, can become more right merely by their manipulation.

PITFALL NO. 2 NON-COMPARABLE DATA

This refers to a failure on the part of the evaluator to make sure that data used in making comparisons are comparable in every way.

This pitfall can create problems in much of our present research--we need to be very careful in drawing conclusions based upon the comparison of todays figures in vocational agriculture with those collected five years or ten years ago.

How to get comparable data is largely a design problem--but if the design is wrong, you can't skew your evaluation to correct it.

PITFALL NO. 3 UNCRITICAL PROJECTION OF TRENDS--OVERWORKING THE DATA

Here I am talking about making predictions for the future based upon existing or past trends. We need to make a number of manpower and other projections today, but in so doing, we have to take into account the factors that were influential at the time the original data was collected. We have to ask the question as to whether these same influences will be existent in the projected period. If not, the projections become meaningless and probably dangerous.

A recent publication[2] from the U. S. Office of Education entitled Research Needs in Vocational-Technical Education for Program and Career Planning lists the analysis and projection of employment, economic and demographic trends as one of the significant areas of needed research for strengthening vocational-technical education.

Those working in projecting needs in agricultural education need to be alert to the inherent problems in this pitfall as they project manpower needs, teacher needs, etc.

---

[2]Research Needs in Vocational-Technical Education for Programs and Career Planning, Prepared in the Employment Opportunities Branch, Division of Adult and Vocational Research, Bureau of Research, U.S.O.E. July, 1966.

PITFALL NO. 4 IMPROPER ASSUMPTION REGARDING CAUSATION

It's not so difficult to find out what happened if you have accurate data, but why it happened is another matter and of course if you have poor data in the first place, this only compounds the problem. Understanding the cause and effect relationship between events is an extremely important element in any research effort and especially in the evaluation phase.

Too often, we jump to the quick conclusion that the change in one event was the cause of change in the other when very often an unknown third factor probably caused the change in both.

This is probably best illustrated by a story heard recently.

The story is about four people: a young, dashing, Russian army officer, a Rumanian businessman, a very pretty young girl, and an elderly woman. All were sitting in the same train compartment riding through Rumania. They came to a tunnel, and while they were in complete darkness, a resounding kiss and a slap were heard. As they come out of the tunnel, the elderly woman was thinking. "I'm certainly glad that young girl defended her honor against the Russian." And the young girl thought, "I wonder why the Russian kissed the old lady instead of me," and the Russian thought, "Clever of that Rumanian to kiss the girl and have me get slapped," and the Rumanian businessman chuckled to himself, "It's my lucky day. I kiss the back of my hand, pinched a young lady, slapped a Russian, got an old lady's mind occupied, and got away with it all."

Of course the moral to the story is to know what caused what before jumping to any hasty conclusions.

PITFALL NO. 5 MAKING COMPARISONS WITH AN ABNORMAL BASE

Here, I am referring to the comparison of results of studies with those of previous standards which were atypical.

Recently, someone pointed out to me the following error is his wife's thinking about rising food costs. His wife was comparing what she spends today for food against her old grocery figures for the same month ten years ago. It was of course several times higher, even greater than normal inflationary trends would lead her to expect. A more careful analysis, however, pointed out that it wasn't all in the rising cost, but the change that has taken place in food markets today. About 50% of this lady's food budget spent at the grocery store consisted of such items as aspirin, garden seeds, flower plants, rugs, charcoal, etc. Many of the items being included as food budget items were in past years bought at stores other than food markets. Therefore, in establishing comparative basis for current evaluation efforts in agricultural education, we need to be aware of this trap.

PITFALL NO. 6 IMPROPER SAMPLING

This has reference to taking an improper small sample and generalizing findings back to a larger group.

A good illustration here is the study made by one of the major toilet paper manufacturers who decided that they should get into the production of colored toilet paper. They hired one of the nation's leading research firms to determine what colors they should produce. A probability sample was drawn, a survey

made, and the colors one would expect to be preferred--green, yellow, blue, and pink showed up, but topping the list was rose. The company made rose colored paper, but it didn't sell. What went wrong? Did people change their minds? Do color preferences for toilet paper change with the seasons? Do people want cool colors in the summer and warm ones in the winter? Was it a poor sample? or What? The answer was in sampling, although it was a good sample from all apparent aspects, about a third of the families interviewed lived in a major housing area in which all the bathrooms were rose colored and they wanted matching paper. Across the country, there were relatively few rose colored bathrooms.

Where the sample is improperly selected, the evaluation becomes meaningless.

PITFALL NO. 7 MISUSE OF STATISTICAL METHODS

We're all guilty on this one.

Applying non-correlated techniques to correlated data.

Using analysis of co-variance on data that really deserves no more than mean, median, and mode treatment.

Probably the answer on this pitfall is to seek the advice and assistance from someone able to distinguish between the right and wrong methods for a particular situation.

Briefly, let me summarize my very random comments about evaluation emphasizing again the need for:

1. very carefully taking evaluation into account when you write your objectives,
2. for care in selecting and use of evaluation techniques, and
3. getting maximum utility from the evaluation that you do carry out.

*VOCATIONAL AGRICULTURE, *OFF FARM AGRICULTURAL OCCUPATIONS, *OCCUPATIONAL CLUSTERS, EMPLOYMENT LEVEL, SALARIES, WORK EXPERIENCE, EMPLOYERS, EMPLOYMENT OPPORTUNITIES, AGE, RESIDENCE REQUIREMENTS, *EMPLOYMENT QUALIFICATIONS, *EDUCATIONAL NEEDS, EDUCATIONAL SURVEYS, OCCUPATIONAL SURVEYS,

Louisiana, Shreveport,

The principal purpose of this survey was to identify off-farm agricultural occupations requiring knowledge and skill in agriculture and to obtain specific job qualifications and training requirements. One of seven surveys in metropolitan areas in the state, it was conducted by trained interviewers. A total of 221 businesses reported 4,338 employees, of which 1,717 in 294 job titles required agricultural knowledge and skill. Job titles were found in all agricultural occupational families and at nine levels with some difference in levels in different families. Job entry age preference by employers was between 25 and 45. Sales level jobs commanded the better beginning salaries. Employers were reluctant to hire those with less than a high school education, and preferred some college. No strong residential background preference was reported by employers, nor was farm experience required. Most employees were required to have agricultural knowledge and skill, with the managerial, supervisory, and sales levels needing more specific familiarity with agricultural subject areas. Recommendations are included on implementation of educational programs in light of the study results. (JM)

PREFACE

Rural youth are finding it increasingly difficult to find employment in their rural communities. They must either farm or seek employment outside the sphere encompassed by production agriculture. Only those rural individuals possessing saleable skills and specialized training in nonfarm agriculture can compete favorably with their urban counterpart for job entry in farm based agricultural occupations.

This report constitutes one segment of the state-wide survey to determine scope and magnitude of agricultural occupations and a description of jobs together with specialized training needed to gain employment in these positions.

The basic data, herein, can be used profitably by school administrators, counselors, teachers, and students to provide a platform upon which to launch a sound, realistic program for vocational agriculture with the view of meeting educational needs for employment in nonfarm agriculture.

ACKNOWLEDGEMENTS

This REPORT was made possible by a grant from the Board of Liquidation of the State Debt through action initiated by the Louisiana Agricultural Teachers Association, members of the staff of Vocational Agricultural Education and the State Department of Education, for use by Louisiana State University in making this study.

Invaluable aid in effecting the Shreveport-Bossier City survey was given to University Researchers by the Division of Employment Security and Officers of the Shreveport Chamber of Commerce.

Especial acknowledgement is expressed to the 221 businesses and agencies cooperating in this study.

OCCUPATIONAL OPPORTUNITIES AND TRAINING NEEDS OF YOUTH FOR NONFARM AGRICULTURAL JOBS IN THE SHREVEPORT - BOSSIER CITY AREA

by

C. M. Curtis* and Anthony Mumphrey**

INTRODUCTION

Shreveport and Bossier City, "The Twin Cities" comprise a metropolitan area unique in character and historical significance. The population figure for this metropolis is some 297,200.

This metropolitan area is a rich agricultural center and the nucleus of a 150 mile trading area containing many well established retail and wholesale outlets in the nature of businesses, many of which deal in products consumable on the farm or in a service available to farmers in the area.

In addition to its agricultural and business complexes, the metropolis has a diversified industrial economy, comprising some 363 industrial plants producing more than 384 different products.

The industrial and agricultural development in this area is truly in the embryonic stage and is growing at a phenomenal pace. Agriculturally, nature has endowed this metropolitan area with a most ideal agricultural climate; it favors growing any agricultural crop profitably.

There are 92 public schools in the parishes of the "Twin Cities", six of which offer vocational agriculture at the secondary school level. Two of the six secondary schools offering vocational agriculture are located within the corporate limits of the city. Fair Park and Woodlawn High Schools have

---

* C. M. Curtis, Associate Professor of Agricultural Education
** Anthony Mumphrey, Associate Professor of Agricultural Education

enrollments in vocational agriculture of 51 and 107, respectively. These enrollments are indicative of much interest in employment opportunities existing in the agricultural complex of the area.

The significance of agricultural enterprises in Louisiana's successful economic history is general knowledge to all. Notwithstanding the fact that production agriculture has decreased in scope during the last 30 years, agribusiness continues to be the predominate industry, contributing the larger share of total employment and income.

In 1959 the average Louisiana farm comprised 139 acres and was valued at $21,000. Data for 1959 reveal that there are some 74,000 farms in the State with a total coverage of 19,347,328 acres.

Data in 1959 for Caddo and Bossier Parishes reveal that total land in farms was 501,000 acres and the average size farm was some 178 acres. The average size of farms in terms of acreage doubled from 1949-1959 and land use for crops decreased by more than two-thirds.

There is a considerable amount of farming in the area around Shreveport and Bossier City as measured by employment data in the industry. A greater proportion of the civilian work force is actually employed in agriculture and its services than the average in the United States as a whole.

Recent studies emphasize that as population continues to increase, the need for well trained employees in agribusiness will continue to be magnified. The trend toward fewer farmers and more individuals employed to supply service, process, and distribute will continue to expand.

PURPOSE OF THE SURVEY

The Shreveport-Bossier City survey is one segment of a Statewide study, comprising seven metropolitan areas.

The principal purpose of the survey was to identify nonfarm agricultural businesses and professional organizations having one or more job titles

requiring knowledge or skill in agricultural subjects, and to obtain specific job qualifications, including training in agriculture associated with job entry.

Funds granted to the University by the Board of Liquidation of the State Debt were used to finance the study.

The overall objective of the study was to provide those engaged in education with a knowledge of present and emerging agricultural occupations, other than farming and ranching, for which instruction in vocational agriculture should be available in public schools.

For purposes of this research, an agricultural occupation other than farming and ranching refers to one for which workers need competencies in one or more of the primary areas of plant and animal science, agricultural business management and marketing, and agricultural mechanization.

To make a determination involving extensive changes in high school programs of vocational agriculture, it was assumed that the following information had to be secured:

1) Number of employees in each and all agricultural business firms or organizations, together with employee identification according to job title held,

2) Competencies needed in agricultural subjects or skills required for job entry and advancement, and

3) Special characteristics of all job titles such as salary or wages, entry age, required formal education and experiences, legal restrictions and union regulations, licensing and certification, and a description of work performed by workers within a particular job title.

SURVEY PROCEDURE

All nonfarm agricultural businesses and organizations within the limits of the metropolitan areas of Shreveport and Bossier City were included in the survey.

Of the 9,100 workers in manufacturing industries in Caddo and Bossier Parishes, at least half are directly engaged in agribusiness endeavors as determined by their primary employment. Manufacturers of food and kindred products alone account for more than 2,000 workers.

The above data indicated from the very onset that businesses that are agriculturally oriented are of great significance as far as the economy of the metropolitan area is concerned.

As a preliminary procedure in the structure for studying the metropolitan area, a comprehensive list of all agriculturally oriented firms and organizations was developed for the Shreveport-Bossier City area; this list was evaluated and finalized to include only those businesses having one or more employees with knowledge or skill in agricultural subjects. The list was supplemented with business listings obtained from the Yellow Pages of the local Southern Bell Telephone Directory, the several trade associations, records of the Shreveport Chamber of Commerce, and the local Division of Employment Security.

Endorsement of the proposed study of these business establishments was extended by the Agricultural Committee of the Shreveport Chamber of Commerce. Officials of the Chamber corresponded with each establishment in the study. In addition, a letter explaining the purpose of the survey was sent to each business by the Dean of the College of Agriculture, Louisiana State University. Additional support was derived from the publicity given by the local newspapers, namely, The Shreveport Times and Shreveport Journal and the local radio broadcasting stations: KWKH and KEEL.

As a second phase of the study, a group of prospective interviewers was recruited by the local Division of Employment Security. They were finalized to six and trained in procedures to conduct the study by University personnel. The surveys were completed in a 15 day period under the direct supervision of University and State Department of Education personnel.

Each interviewer was given a group of firms to contact relative to acceptable time schedules for interview. All information pertinent to the study was recorded, using the survey instrument developed for the Statewide study. A sample of this schedule is included in Appendix C of this report.

A total of 221 businesses cooperated in the study--this included 100 per cent of the firms having employees with knowledge or skill in agricultural subjects.

These business establishments employed 4,338 employees, with some 1,717 having agricultural competencies. Projected for the next five years was the need for 213 additional workers possessing agricultural competencies. Nearly 40 per cent of the total employees were found to have competencies in agriculture. This figure appears to be relatively low, considering that the businesses being surveyed were assumed to be agriculturally oriented.

TREATMENT OF SURVEY INFORMATION

In order to present and interpret survey information, the data were organized under three general categories, namely,

1) Occupational families
2) Classification of job titles into levels of employment and training required in agricultural subjects, and
3) Special requirements for job entry

To provide for better coordination of summary data at the National level, occupational families were used as adopted by the National Center for Research in Vocational Agricultural Education at Ohio State University. These families were determined to be as follows:

Farm Machinery Sales and Service
Farm Supplies and Equipment
Livestock and Poultry
Crops, Forestry and Soil Conservation
Ornamental Horticulture
Wildlife and Recreation
Farm Service
Agricultural Service

The number of employees was determined for each occupational family, as well as the number of these workers having competencies in agriculture now and five years hence. Job titles were determined by occupational family and projected new job titles were surveyed in each occupational family. Job titles

were also classified according to levels of employment, that is, professional, technical, managerial, supervisory, sales, office, skilled, semi-skilled, and unskilled.

In each occupational family and level of employment, data were collected concerning age of entry into occupation, monthly salary, and number of employees needing knowledge or skill in each subject matter area, namely, crops, livestock, management, and mechanics.

More specifically, requirements for each occupational family were determined according to each job level. Such employment requirements as: education, residential background, farm experience, and continuing education required for advancement were also determined.

The data in this study were intended to reveal occupational opportunities in nonfarm agriculture in the Shreveport-Bossier City metropolitan area. These data will serve as tools to be used by secondary school guidance counselors as they guide students toward certain vocational objectives. Implementation of the facts as interpreted in this study will provide a firm basis for program development to insure students receiving vocational training necessary to gain entry and succeed in nonfarm agricultural occupations.

PRESENTATION AND ANALYSIS OF SURVEY INFORMATION

Types of Firms

The various types of firms surveyed were grouped according to occupational families. Some 130 different types of firms were included in this study of the Shreveport-Bossier City area. The occupational family (Crops, Forestry, and Soil Conservation) contained more types of firms, with the family (Farm Service) having the second greatest concentration.

A complete list of the types of firms in each occupational family follow:

I. Farm Machinery Sales and Service
   - Automation Equipment Company
   - Farm Machine and Equipment Dealer
   - Automobile Dealer
   - Contractors Equipment Company

Farm Implement Company

II. Farm Supplies and Equipment
- Hardware Store
- Fence Company
- Department Store
- Feed and Seed Store
- Louisiana Agricultural Cooperative
- Building Supply Store
- Dime Store
- Fertilizer Company
- Wholesale Distributing Company
- Chemical Dealer (Agricultural)
- Pet Market
- Garden Center
- Veterinarian Supply Company
- Feed Mill
- Dairy Farm Equipment Dealer
- Farmer's Cooperative
- Lumber Company

III. Livestock and Poultry
- Slaughter House
- Butcher Shop
- Meat Market
- Egg Processing Company
- Milk Distributorship
- Creamery
- Wholesale Meat Distributor
- Dairy Products Company
- Boarding Stables
- Livestock Auction Barn
- Rendering Plant
- Poultry Market
- Packing Plant
- Soap Corporation
- Hatchery
- Grocery Store
- Poultry and Egg Processing Company
- Poultry By-Products Company
- Stockyard

IV. Crops, Forestry, and Soil Conservation
- Louisiana Forestry Commission
- Fruit Exchange Company
- Tree Service Company
- Logging Company
- Produce Company
- Rice By-Products Company
- Coffee Company
- Fruit Company
- Forest Service (U.S.)
- Rice Mill
- Wood Preserving Company
- Grain Company
- Canned Food Company
- Lumber Company (Sawmill)

Tomato Company
Oil Mill Company
Pulpwood Company
Food Store
Cotton Gin
Cotton Brokerage Company
Paper Company
Planting Company
Sugar Company
Cotton Products Company
Creosoting Company
Fruit Stand
Cotton Division, Market Service

V. Ornamental Horticulture
Garden Center
Nursery
Florist
Landscape Company
Wholesale Florist

VI. Wildlife and Recreation
Golf Course
State Park
Riding Stable
Taxidermist
S.P.C.A.
City Park
National Park
Playground
Golf Course Service Company
Country Club
Louisiana Wildlife and Fishing Commission
State Park and Recreation Commission

VII. Farm Service
Welding Company
Machine Shop
Electric Power Supplier
Pest Exterminating Company
Artificial Breeders
Credit Association
Farmer's Home Administration (U.S.D.A.)
Radio Station
Realty Company
Aero Farm Service
Water Well Company
Auto Repair Shop
Research Consulting Firm
Building Contractor
Livestock Brand Commission
Television Station
Insurance Company
Farm Service Laboratory
Airplane Service

Iron Works Company
Land and Oil Company
Blacksmith
Plant Pest Control Division (U.S.D.A.)
Farm Bureau

VIII. Agricultural Service
Animal Hospital
Veterinarian
Agricultural Stabilization and Conservation
State College
Agriculture Extension Service
Soil Conservation Service
State Department of Agriculture
Vocational Agriculture Teacher
State Market Commission
County Agent
U. S. Department of Agriculture
Animal Disease Eradication (U.S.D.A.)
Bank (Commercial)
State Land Office
News Bulletins
Levee Board
Forest Experiment Station
Plant Pest Control (U.S.D.A.)
Bank (Federal Land Bank Association)
U. S. Air Force, S.A.C.
State Fair Association

Number Employed in Nonfarm Agriculture

Data in Table I reveal the number of agricultural businesses, industries, and agencies categorized according to occupational family. A total of 221 businesses were surveyed; more than 70 per cent of these firms were in Farm Supplies and Equipment; Crops, Forestry and Soil Conservation; Farm Service; and Agricultural Service. The greatest concentration was in Farm Supplies and Equipment.

Of the 4,338 employed in the eight occupational families, 1,717 currently had competencies in agriculture, with 1,904 workers needed with agriculture competencies five years hence.

TABLE I

NUMBER OF AGRICULTURAL BUSINESSES, INDUSTRIES, AND AGENCIES BY OCCUPATIONAL FAMILY, 1964

Occupational Family	Number
Farm Machinery, Sales and Service	8
Farm Supplies and Equipment	50
Livestock and Poultry	22
Crops, Forestry and Soil Conservation	37
Ornamental Horticulture	25
Wildlife and Recreation	4
Farm Service	32
Agricultural Service	43
Total	221

Table II indicates that 40 per cent of those employed in nonfarm agriculture in the Shreveport-Bossier City area required competencies in agriculture; a projected increase of 10 per cent needing training in agriculture does not neutralize the observation that businesses in this area could profit by employing better trained individuals for occupations which are agriculturally oriented. Management principles would appear to favor the individual who is better prepared for specific occupations.

Approximately 75 per cent currently employed having competencies in agriculture were found in only four occupational families, namely, Farm Supplies and Equipment, Livestock and Poultry, and Crops, Forestry and Soil Conservation; and Ornamental Horticulture.

All occupational families revealed an increase in projected employment of individuals having competencies in agriculture five years hence.

TABLE II

NUMBER OF PERSONS EMPLOYED IN AGRICULTURAL BUSINESSES, INDUSTRIES, AND AGENCIES, AND NUMBER OF EMPLOYEES HAVING AGRICULTURAL COMPETENCIES, BY OCCUPATIONAL FAMILY

Occupational Family	Total No. Employees	Employees Having Agricultural Competencies	
		Current Employment	Expected Employment Five Years Hence
Farm Machinery Sales & Service	367	86	105
Farm Supplies & Equipment	1,173	384	421
Livestock & Poultry	827	306	329
Crops, Forestry & Soil Conservation	418	371	379
Ornamental Horticulture	239	219	260
Wildlife & Recreation	42	21	35
Farm Service	201	129	161
Agricultural Service	1,071	201	214
Total	4,338	1,717	1,904

Job Titles According to Occupational Families and Levels of Employment

The 1,717 employees having competencies in agriculture held some 294 job titles, with more than 70 per cent of these jobs being in only four occupational families, namely, Farm Supplies and Equipment; Livestock and Poultry; Crops, Forestry and Soil Conservation; and Agricultural Service.

It is interesting to note in Table III that a projected increase of only 22 job titles is anticipated in five years. This may be due in part to management consolidating certain jobs for efficiency with possibly more new job titles being reflected than the data actually reveal.

TABLE III

NUMBER OF JOB TITLES IN AGRICULTURAL OCCUPATIONS OTHER THAN FARMING, BY OCCUPATIONAL FAMILY

Occupational Family	Number of Job Titles	Number of Job Titles Five Years Hence
Farm Machinery Sales and Service	19	19
Farm Supplies and Equipment	50	50
Livestock and Poultry	53	55
Crops, Forestry, & Soil Conservation	52	56
Ornamental Horticulture	30	31
Wildlife and Recreation	7	9
Farm Service	26	36
Agricultural Service	57	60
Total	294	316

A complete analysis of job titles is indicated for each of the eight occupational families, including the number of workers in each title as revealed by this study.

Levels of Employment in Nonfarm Agriculture

A listing of individuals employed in the various job titles and at a particular level of employment in Table IV reveals at a glance opportunities available to youth. A ranking of level of employment frequency occurring in all occupational families is as follows:

1) Unskilled
2) Managerial
3) Semi-Skilled
4) Sales
5) Office
6) Skilled
7) Supervisory
8) Professional
9) Technical

Table IV also shows a concentration in the unskilled level of employment in Livestock and Poultry, Crops and Forestry, and Ornamental Horticulture; the semi-skilled appears to build up primarily in Farm Supplies and Equipment, Livestock and Poultry, and Crops, Forestry and Soil Conservation. The management levels of employment appear to offer more opportunities in Farm Supplies and Equipment, Livestock and Poultry, and Crops, Forestry and Soil Conservation. Sales opportunities appear more frequently in Farm Supplies and Equipment, and Livestock and Poultry.

TABLE IV

TOTAL EMPLOYEES WITH AGRICULTURAL TRAINING
BY LEVELS OF EMPLOYMENT IN OCCUPATIONAL FAMILIES

Total	65	54	290	80	260	185	126	279	378	1,717

Job Entry Age For Nonfarm Agricultural Workers

The average age of all employees was surveyed for each of the 221 firms, by occupational family and for each level of employment. Consideration was given to the present age, minimum age for entry, and the maximum age for entry.

It is interesting to note that the average minimum age for entry in all occupational families and for practically all levels of employment is centered around 25. The average maximum age for entry surprisingly is centered around 45.

The case in point for the average minimum of 25 connotes that possibly youngsters are generally not adequately prepared for job entry for specific occupations upon graduation from high school and that some six to seven years additional training is necessary to effect job entry. It is quite plausible that if individuals would receive sufficient training in occupational skills while still enrolled in the secondary school, the age of job entry may be reduced.

Tables V-1 through V-8 indicate average ages for each occupational family and for each level of employment within the occupational family.

Salaries of Employees Working in Nonfarm Agriculture

Median monthly salaries or wages were calculated for all occupational families and for each level of employment. Tables VI-1 through VI-8 reveal the median monthly salary, including beginning and maximum salaries.

The median monthly salary for skilled occupations was nearly $100.00 more than in the unskilled for Farm Supplies and Equipment; Wildlife and Recreation; and Farm Service.

In most instances in all the occupational families, at the professional level of employment beginning salaries were found to be less than at the technical, managerial, or supervisory levels. The Agricultural Service is manifestly an exception to this trend.

Sales as a level of employment in all the occupational families appear to hold a strong position relatively speaking as far as beginning salaries are concerned.

In all families, except Wildlife and Recreation, the professional, managerial, supervisory, and sales levels of employment revealed beginning salaries

at more than $300.00 monthly.

The usual salary for the unskilled was found to be less than $200.00 monthly, except in the case of Livestock and Poultry, and Ornamental Horticulture occupational families.

No professional personnel were found in Farm Supplies and Equipment; Livestock and Poultry; and Wildlife and Recreation.

Maximum salaries appear to be normal in character as the individual secures more experience and advances in years of service. It is interesting to note the beginning salaries of technicians in Ornamental Horticulture and Farm Service.

Those individuals employed in the unskilled level of employment not only were employed at the lower beginning salary, but did not make as much progress in building their salaries with years of service.

No technicians were found in Farm Machinery Sales and Service; Farm Supplies and Equipment, and Wildlife and Recreation.

Educational Level Desired of Persons Entering Nonfarm Agricultural Occupations

The data in Table VII reveal the educational level desired for persons entering agricultural occupations other than farming. These data are analyzed for each occupational family by number of employees desired at each educational level.

TABLE VII

EDUCATIONAL LEVEL DESIRED FOR PERSONS ENTERING
AGRICULTURAL OCCUPATIONS OTHER THAN FARMING

	Number of Employees					
Occupational Family	Less Than H.S.	H.S. Graduate	Post H.S. Technical Education	Some College	College Degree	No Preference
Farm Machinery Sales & Service	0	44	0	24	18	0
Farm Supplies & Equipment	16	179	16	69	82	22
Livestock & Poultry	66	149	3	32	51	5
Crops, Forestry & Soil Conservation	80	133	21	67	68	2
Ornamental Horticulture	20	58	0	25	16	100
Wildlife & Recreation	0	14	0	1	2	4
Farm Service	1	53	3	18	45	9
Agricultural Service	27	79	0	20	73	2
Total	210	709	43	256	355	144

As in any other business endeavor where efficiency in operation is the determining factor, the management of nonfarm agricultural businesses did not desire individuals possessing less than a high school education. Only 12.2 per cent of those employed were found to have less than some high school training. It is more significant that only 2.5 per cent of the 1,717 employees possessed post-high school technical training. This fact appears to be somewhat unusual since some of the families require competencies which seem to be highly technical.

A preference for some college was expressed for 611 or 35.6 per cent of employees in the eight occupational families, more than 40 per cent of the total employees possessed at least a high school education. This information should be of great consequence in the planning of student conferences held by secondary school guidance counselors.

Over 144 or nine per cent of the employees would be replaced without regard to formal education, provided they had the necessary knowledge and skill. This reflects the significance of education in today's work world.

Nearly 77 per cent of the employees possessed a high school education and above. This fact should offer students a great incentive to remain in school and at least complete high school.

Farm Machinery Sales and Service, and Wildlife and Recreation occupational families require some high school training for job entry in nonfarm agricultural occupations; the other occupational families would accept employees with only an elementary level of education but on a very limited basis.

Residential Background Preferred for New Employees

According to data in Table VIII, employers or their designated representatives indicated that generally they had no preference as to the residential background of the prospective employee; however, they did not indicate a

preference for the urban individual. Some 65 per cent of the job titles in all of the occupational families were given a "no preference" as to residential background preferred for new employees.

TABLE VIII

RESIDENTIAL BACKGROUND PREFERRED FOR NEW EMPLOYEES

Occupational Family	Farm		Rural-nonfarm		Urban		No Preference	
	No.	Per Cent	No.	Per Cent	No.	Per Cent	No.	Per Cent

Agricultural Service	50	25	20	10	0	0	131	65
Total	537		49		7		1,124	

More than 30 per cent of the jobs required a farm residential background.

Farm Experience Preferred of New Employees

The data in Table IX reveal that of the 1,717 jobs in the eight occupational families surveyed in the Shreveport-Bossier City Metropolitan Area only 537 or 31.3 per cent required a farm background for new employees.

The commercial type farm experience was preferred for only 73 or 13.59 per cent of the jobs; more than one-fourth of the jobs preferred individuals who had experience on the noncommercial type farm. The fact that nearly 60 per cent of the jobs showed "no preference" for the commercial or noncommercial types of farm experience is indicative that these skills could be

learned "on-the-job" as the individual normally pursued his work.

It is significant to note that some 77 per cent of the jobs in Livestock and Poultry indicated no preference as to farm experience; 90 per cent of the jobs in Crops, Forestry, and Soil Conservation also required no specific type of farm experience.

TABLE IX

FARM EXPERIENCE PREFERRED FOR NEW EMPLOYEES

Occupational Family	Commercial Farm		Noncommercial Farm		No Preference	
	No.	Per Cent	No.	Per Cent	No.	Per Cent

Total	73	13.59	149	27.75	315	58.66

Agricultural Subjects With Which Prospective Workers Must Have Knowledge or Skill

Table X-1 through X-8 reveal the agricultural subject area in each occupational family with which employees must be familiar at each level of employment.

These data indicate a general trend toward the managerial, supervisory, and sales levels of employment in most occupational families requiring more familiarity with specific agricultural subject areas. The fact that only Crops, Forestry, and Soil Conservation; Ornamental Horticulture; Farm Service; and

Agricultural Service had employees at the professional level of employment clarifies to some extent the small employee frequencies relative to agricultural areas with which employees must be familiar.

With the exception of Wildlife and Recreation, there was a need for the office level of employment to be familiar generally with all agricultural subject areas. This is probably because of the necessity of the office worker having to handle terminology and data daily in routine assignments.

It is significant to note that in many of the more specialized families, even the semi-skilled and unskilled were required to be familiar with most agricultural subject areas.

In most instances, the skilled worker was required to be familiar with only his specialized field of operation rather than possess a great knowledge of agriculture as was the case with the managerial, supervisory, and sales levels of employment.

The educational implications in the case of the upper echelon levels of employment make it desirable for individuals to possess a greater volume of agricultural "know how" than at other levels of employment. A person bringing a rich supply of these experiences to a business could enhance his chances of climbing the occupational ladder.

Continuing Education Required of Employees and Educational Facilities Used

The data in Table XI indicate the employee frequencies by occupational family for the kind of training required for employees and the type of educational facility selected to provide this training.

TABLE XI

CONTINUING EDUCATION REQUIRED BY FIRMS TO ADVANCE IN OCCUPATIONS

		Number of Firms					
Occupational Family	No.	Firm or Industry School	On-the -job Training	Pub.Sch. Adult Educ.	Voc. School	Agri. School	None
Farm Machinery Sales & Service	86	33	47	0	40	9	3
Farm Supplies & Equipment	384	69	342	53	56	24	11
Livestock & Poultry	306	110	127	13	0	28	48
Crops, Forestry & Soil Conservation	371	14	195	5	148	138	146
Ornamental Horticulture	219	65	150	1	89	69	10
Wildlife & Recreation	21	0	4	0	0	2	15
Farm Service	129	19	101	0	27	23	13
Agricultural Service	201	14	131	1	12	29	14
Total	1,717						

The greatest concentration of continuing education as revealed for firms in the Shreveport-Bossier City Metropolitan Area in all occupational families, except Ornamental Horticulture and Wildlife and Recreation, appears to be in the firm or industry school and on-the-job training. There were some 1,421 employee frequencies out of some 2,360 responses in the various occupational families requiring continuing education on-the-job or in a firm or industry school. The greatest concentration of employee frequency was in the "on-the-job training" category. This is a clear indication that prospective employees do not possess the necessary knowledge and skills.

SUMMARY, CONCLUSIONS, AND RECOMMENDATIONS

For many years the primary aim of vocational agriculture has been to train present and prospective farmers for proficiency in farming. In order to carry out this aim effectively, the bulk of instructional and supervised practice programs has been in the areas of farm management and production.

There is certainly a necessity for well-trained individuals to meet the challenge of the farm today and tomorrow; however, educators are also well aware of others who need preparation for the large number of off-the-farm agricultural occupations that exist and continue to increase. This study of the Shreveport-Bossier City Metropolitan Area is an example of the dire need for such workers in the many phases of agricultural occupations found in this area. Programs of instruction for students in vocational agriculture must of necessity, therefore, include training which will meet the needs of all students.

Strong, personal relationships will need to be maintained between the teacher, the students, and their parents. A broad type of vocational education program in agriculture must be planned which will open several doors of opportunity rather than provide only narrow, specialized training for single careers. This kind of program should be made as much a part of the high school curriculum as the traditional vocational agriculture program. In addition, the program must provide the means by which boys can learn to become men while at the same time developing the needed competencies in their chosen careers.

Parents of high school students enrolled in vocational agriculture will be looking to school administrators to provide opportunities in the school for students to explore career areas in which they are interested. Along with this thinking, parents will also expect vocational courses at the secondary

school level to provide a practical application of what is learned in the classroom, and at the same time develop habits of responsibility, industry, and dependability, as well as leadership and ethical character.

Summary

Evidence in this study reveals beyond any doubt that many occupational opportunities exist in the Shreveport-Bossier City Metropolitan Area for students who are agriculturally trained in skills usable in agricultural occupations.

Because of the nature of the farming area surrounding this Metropolitan Area, there would appear to be available for employment a number of rural youths who at least possess some knowledge of the farm.

The businesses and industries surveyed in this study have employed many urban as well as rural youths. In most instances, they did not indicate a preference for the farm reared individual. It should be noted, however, that they did not indicate that they preferred the urban youth, either. The implication of these observations is that there really has been no noticeable difference between the rural and urban employee as far as skills and knowledge of agriculture is concerned.

The 221 agriculturally oriented businesses or industries and the 1,717 individuals employed having competencies in agricultural occupations is a clear indication of the need for individuals who possess a knowledge of agriculture. Secondary schools should be concerned with the preparation of youth to gain entry and succeed in the many occupational opportunities existing in the firms allied to agriculture in this Area. Management will be looking to schools to provide the steady supply of workers to replace those who normally leave or retire from occupations allied to agriculture. In addition, many additional businesses will develop in this agricultural complex as the industries expand.

A summary of the findings in this study is as follows:

1. Two hundred and twenty-one agricultural firms were surveyed in the Shreveport-Bossier City area. These firms employed some 4,338 individuals; of this number approximately 40 per cent or 1,717 had competencies in agriculture and 197 additional employees who possess agricultural skills will be needed in the next five years.

2. Some 294 job titles were indicated by employers in all of the eight occupational families, with an increase of only 22 job titles in the next five years.

3. More than 72 per cent of the job titles were found in four occupational families, namely, Farm Supplies and Equipment; Livestock and Poultry; Crops, Forestry and Soil Conservation and Agricultural Service.

4. Employees were found in all occupational families and in nine levels of employment in the businesses surveyed. A concentration in the unskilled level of employment appears in Crops, Forestry and Soil Conservation, and Ornamental Horticulture. The management levels of employment appear to offer more opportunities in Farm Supplies and Equipment; Livestock and Poultry; and Crops, Forestry and Soil Conservation; sales offer more opportunities in Farm Supplies and Equipment.

5. The mean minimum age for job entry in all occupational families and for practically all levels of employment is focused around 25. The mean maximum age for entry is 45.

6. In most occupational families, beginning salaries at the professional level of employment were lower than at the technical, managerial, or supervisory levels.

7. The professional level of employment is represented in all occupational families except Wildlife and Recreation.

8. The median monthly salary for skilled occupations was nearly $100.00 more than the unskilled for Farm Supplies and Equipment; Wildlife and Recreation; and Farm Service.

9. Sales, as a level of employment, commands a strong position compared to beginning salaries in other occupational families. Sales commissions may have a significant effect in boosting the beginning worker's salary.

10. These data reveal that individuals employed in the unskilled levels of employment not only were employed at the lower beginning salary but did not appear to make near the progress in building their salaries with years of service.

11. It is interesting to note that technicians were not found in Farm Machinery Sales and Service; Farm Supplies and Equipment; and Wildlife and Recreation.

12. The managers or representatives of nonfarm agricultural occupations surveyed in this study did not desire to employ individuals with less than a high school education.

13. A preference for some college was expressed for more than 35 per cent of the employees in all occupational families.

14. Some nine per cent of the employees were in the "no preference" category as far as educational level desired is concerned.

15. A most significant fact was revealed indicating that nearly 77 per cent of the total employees possessed a high school education and above.

16. Some 65 per cent of the positions in all of the occupational families were given "no preference" as to residential background preferred for new employees.

17. Although business representatives interviewed did not indicate a preference as to the residential background of the prospective employee, they did not indicate that the urban reared individual would be preferred.

18. Only 31.3 per cent of the 1,717 jobs in the eight occupational families surveyed in the Shreveport-Bossier City Metropolitan Area required a farm background for new employees.

19. The commercial type farm experience was preferred by employers for only 13.59 per cent of the jobs; more than one-fourth of the positions preferred individuals who had experience on the noncommercial type of farm.

20. The managerial, supervisory, and sales levels of employment in most occupational families generally required more familiarity with specific agricultural subject areas.

21. Even the semi-skilled and unskilled workers were required in many instances to be familiar with most agricultural subject areas.

22. Some 1,421 employee frequencies out of some 2,360 responses in the various occupational families required continuing education on-the-job or in a firm or industry school.

Conclusions

A study of the agricultural occupations in the Shreveport-Bossier City Metropolitan Area revealed the tremendous impact these agricultural businesses have on the economy of the Area, in addition to the many varied occupational opportunities available to properly trained individuals in nonfarm agriculture. While, in most instances individuals employed by these firms did not receive specific job training previous to being employed, many were successful in gaining job entry and received training while on-the-job. Industrial firms

as well as nonfarm agricultural businesses have expressed repeatedly, however, their desire to employ experienced young people having knowledge and skills in agriculture.

By revealing the training needs for youth to gain entry in agricultural occupations, this study opens the door to many additional employment opportunities for youth in on-farm agricultural pursuits. Secondary school educators should make every effort to offer training in employment areas for which there are occupational opportunities.

Vocational agriculture cannot continue to be completely justified in cases where the only vocational objective of students is to "farm". There are numerous and varied occupations in farm based agriculture for which youth could prepare. Vocational agriculture must accept the challenge to prepare individuals not only for the farm but for the host of other jobs supporting production agriculture. Secondary school programs should be geared to make training fcr these individuals a reality rather than a desire.

Today, an individual who does not possess a saleable skill is in reality an unemployable. There are few "jack of all trades'; an individual must be prepared to render a particular service to a business or firm to insure employment. This type of individual must be a product of the training program offered during his formative educational program.

The conclusions drawn from this study of nonfarm agriculture in the Shreveport-Bossier City Area will serve as guides in giving direction to programs intended to prepare youth for gainful employment in agricultural occupations. By so doing, the vocational agriculture program will help keep the boys "at home" and simultaneously, provide a steady flow of individuals with experiences needed for job entry in off-farm agriculture. This occurrence does not negate the fact that training for production agriculture will continue to be a vocational objective for some who study vocational agriculture

at the secondary school level.

The more significant conclusions drawn from this survey are as follows:

1. The 221 farm based businesses employing some 4,338 individuals, nearly 46 per cent having skills in agriculture, constitute a principal segment of the total economy of the Shreveport-Bossier City Metropolitan Area.
2. The 294 job titles found in all of the businesses allied to agriculture, together with the fact that only 22 additional job titles will be anticipated five years hence is revealing evidence of the stability in competencies required for efficiency in these businesses. Guidance counselors could well establish some definite trends towards the needs for specific skills in certain areas of employment.
3. Although the firms surveyed had positions available at all levels of employment, the higher echelon employment opportunities were always favoring the individual possessing more formal education.
4. The mean job entry age of 25 is more significant from the standpoint that secondary school youth must normally wait five to six years before qualifying for certain jobs. Presumably, these individuals do acquire some knowledge or skills, on their own, for job entry during this interim. Therefore, it is conceivable that the median job entry age could be lowered if the individual could secure the proper skills or training earlier.
5. The skilled individual, including those at the technical, managerial, and supervisory levels of employment maintain a commanding position in establishing the higher beginning salary for employees.
6. At least a high school education is a necessity for job entry; training beyond high school was desired for more than one-third of the employees surveyed.
7. The observation that 65 per cent of the job titles did not require a rural

residential background for new employees does not lessen the importance of the 35 per cent who must have this type of background to be employed.

8. It is apparent from the data in the study that farm experience does not necessarily have to be on the commercial farm. There appears to be few experiences the commercial farm can offer which cannot be satisfied by the noncommercial farm.

9. The farm background required for nearly one-third of the workers is most significant as far as counseling is concerned and the establishment of vocational objectives by secondary school youth.

10. Continuing education on-the-job or in a firm or industry school continues to play a dominant role in the efficiency of any industry or business today. Rapid technological changes are responsible for the "day by day" training needed by employees to increase their efficiency.

11. Salaries for all levels of employment are commensurate with the training and skills possessed by the beginning worker. His occupational progress financially is also paralleled to the individual's capacity to increase his level of performance and skill.

Recommendations:

In order for the program in vocational agriculture to be effective today, it must offer a program of instruction and experience in keeping with the general education needs of youth and specialized emphasis on individual vocational needs in the work world. This can be accomplished by identifying the vocational and specialized needs of youth and providing an educational program to match their needs.

This study reveals the tremendous impact that nonfarm agriculture has on the economy of this Region. To some extent this influence is even greater in other areas of the State. Production agriculture is creating a greater giant known as the "Supporting Agricultural Complex". The need for trained workers

is certainly reflected in the expressions by business representatives that they are willing to employ the urban as well as the rural, the individual with commercial farm as well as the one with noncommercial farm experience. Agribusiness in the Shreveport-Bossier City Area needs trained agricultural workers in considerable numbers and with a variety of agricultural skills.

The secondary school program as well as the program in vocational agriculture should accept the challenge in providing the needed personnel for the ever-expanding businesses allied to production agriculture. The employment opportunities for youth are tremendous in the host of occupations supporting the farm.

Based upon survey data the following recommendations are offered:

1. Pre-employment training is essential for individuals to gain job entry. A broadened program in vocational agriculture providing basic instruction in the science of agriculture, together with the necessary participating experiences in agricultural occupations, is needed for those who desire this type of training.
2. Educators, and especially the guidance counselor, should broaden their knowledge of the farm and the occupational skills needed to succeed in nonfarm agriculture. The training of the individual can be better channeled with this knowledge in action.
3. After making a careful analysis of the occupational opportunities in nonfarm agriculture, education should provide opportunities for the exploration of areas of interest as the student progresses in his secondary school program.
4. The general education level of students must be considered even more significant than ever before. The fact that employers want individuals with a high level of education should be motivating to youth.
5. Students should become familiar with the specific skills required in the

various occupational families and in the job titles found in those occupational families of interest to him. A job description handbook for students interested in nonfarm agriculture would be invaluable in counseling with students.

6. The necessary resources must be assembled to provide training for individuals in vocational agriculture. These resources could be marshalled to provide the necessary experiences for those planning to farm, enter agricultural occupations, or pursue further training in higher education.
7. Educators should provide youth with the training necessary to understand business and business principles and how businesses in the community provice goods and services. The individual student can, therefore, become thoroughly acquainted with the needs of employers and will be more familiar with how to make his services available to the businesses or firms.
8. Teachers of vocational agriculture should plan for the general instructional level of training youth during the early part of his vocational training and concentrating his participating experiences during the last two years to insure employee compentency when the individual is ready to offer his service.
9. Educational leaders would do well to do just as the businessman does in analyzing his business needs from year to year. If the educator and the business employers correlate their planning, and become thoroughly familiar with each others needs, individuals as well as businesses would ultimately profit.

Manpower Development and Training Act of 1962, California, Area

Redevelopment Act,

Although various retraining programs are covered, special emphasis is given to the programs developed under the Manpower Development and Training Act (MDTA) since September 1962. Occupational training is of special significance to California's rapidly changing economy. While many are unemployed, there are thousands of jobs which call for special knowledges, skills, and abilities. In 1964, six percent of the state's labor force was unemployed. From September 1962 through December 1964, 14,900 trainees have been enrolled in MDTA courses, 13,754 in school-connected courses, and 1,146 in on-the-job training programs. Of the 5,698 who had completed courses by December 31, 1964, 75 percent were gainfully employed, and 91 percent were in training-related occupations. From September 1961 through December 1964, 9,317 individuals had been approved for training under California state retraining programs with 3,626 completing training. Of these, 62 percent obtained employment within 30 days following completion. Programs under the Area Redevelopment Act involved about 80 persons. Enrollment in vocational education courses in 1963-64 was 1,034,000. Educational, occupational, and statistical data on which this report was based and the Manpower Development and Training Act of 1962 are included in the appendix. (EM)

Retraining in California

This is a report on vocational training in California under the Manpower Development and Training Act, California retraining benefits legislation, the Area Redevelopment Act and vocational education programs.

Training under these programs supports the intent of Congress in establishing the Manpower Development and Training Act that, . . . "it is in the national interest that current and prospective manpower shortages be identified and that persons who can be qualified for these positions through education and training be sought out and trained as quickly as is reasonably possible, in order that the Nation may meet the staffing requirements of the struggle for freedom."

Sacramento, California

January, 20, 1965

THE HONORABLE EDMUND G. BROWN, *Governor*
The Honorable President Pro Tempore,
California State Senate
The Honorable Speaker,
California State Assembly

This is a report of the administration of the various retraining programs in California. While this report covers all training programs currently in effect in California, particular emphasis is given the Federal Manpower Development and Training Act since its inception in September of 1962. The report tells what has been accomplished under the Manpower Development and Training Act, how it has been done, what can be expected in the future and what will be required of California to continue to benefit from this legislation.

Occupational training is of special significance to California's rapidly changing economy. Today unemployment exists side by side with rising standards of living and increased business activity. And while many of our unemployed remain jobless, there are thousands of jobs unfilled because of lack of applicants with the necessary knowledges, skills and abilities. A major weapon in correcting this disparity is the MDT program.

The administration of the Manpower Development and Training Act involves three state agencies, namely, the State Departments of Employment, Education and Industrial Relations. All three of these agencies were seasoned and experienced in their basic respective roles of (1) determining training needs and placement, (2) development of curricula and giving training, and (3) development of on-the-job training. Consequently, soon after federal guidelines and funding were made available, California was able to implement the program and lead the nation in accomplishments.

California's economic future depends on the flexibility and adaptability of the state's workers. The effects of increasing technological change and automation are compounded in California by the defense-based nature of a considerable portion of California's industry. It is, therefore, realistic to concede that the combination of change and fluctuating aerospace contracts will result in recurring shifts and adjustment in our employment and occupational demands.

Particular attention is drawn in the report to funding. Although the federal government has until now provided full financing, the Manpower Development and Training Act requires that the states bear one-third of the costs of MDTA training beginning July 1, 1965, and one-half of the costs of MDTA training beginning July 1, 1966.

The following, therefore, is respectfully submitted as requested by the Senate Finance Committee during its review of the 1964–65 budget. Knowing the Legislature's deep concern, we are taking the liberty of sending a copy to each member, and shall make the report available to others interested in manpower development and training.

Sincerely,

Albert B Tieburg

ALBERT B. TIEBURG
Director of Employment

Max Rafferty

MAX RAFFERTY
Superintendent of Public Instruction

Retraining Highlights

THE NEED

In 1964, there was an average of 422,000 unemployed in California. This represented 6 percent of a labor force of 7,064,000. Paradoxically, many thousands of jobs remained unfilled because of the lack of qualified workers.

ACCOMPLISHMENT

Manpower Development and Training Act

From September 1962 through December 31, 1964, 14,900 trainees have been enrolled in MDTA courses; 13,754 in "institutional" (school-connected) courses; and 1,146 * in on-the-job training programs. Trainees completing institutional MDTA courses as of December 31, 1964, totaled 5,698 with 4,272 or 75 percent now gainfully employed—3,876 or 91 percent in training-related occupations.

State Retraining Benefits Program

From September 1961 through December 31, 1964, 9,317 individuals have been approved for training under the California state retraining program (Senate Bill 20 of 1961,) with 3,626 completing training. Of these, 2,231 or 62 percent obtained employment within 30 days following completion,—89 percent in training-related jobs.

California is one of 20 states which has this type of retraining program.

Area Redevelopment Act

There have been two training projects approved under the Federal Area Redevelopment Act in California. One project has been completed and the other is ongoing. In the completed project, 24 trainees were enrolled, 12 completed training and 5 were placed in employment. The ongoing project enrolled 20 trainees, with two additional classes for 20 trainees each to follow. Most of the areas in California that are eligible for assistance under this Act have less than 15,000 people in their work force and have agriculture and forestry as their primary industries.

Vocational Education

During fiscal year 1963–64, there were 1,034,000 individuals enrolled in occupationally centered courses under the vocational education program. This is an increase of 51 percent over the 685,000 enrolled in such courses during fiscal year 1962–63.

* SOURCE: Bureau of Apprenticeship and Training, U.S. Department of Labor.

The Economic Impact

Retraining programs restore earning power and reduce costs of unemployment insurance, welfare and other forms of public assistance. For example, here is the projected impact of the Manpower Development and Training Act in California for those trainees who have obtained jobs through December 31, 1964:

Gross annual earnings will amount to an estimated $16,000,000:

A typical illustration showing the impact of earnings is that of an unemployed 22-year-old married man with three dependents who relied principally upon part-time or seasonal jobs which paid him from $1 to $2 per hour.

He was counseled and enrolled in an El Centro farm mechanic MDTA course. He had no mechanical training but had tinkered with cars. Upon completion of the training, he accepted a job with an automotive repair shop and received additional training as an automotive brake and front-end specialist. He is now employed full time at a salary of $90 per week.

Annual savings to the Unemployment Insurance Fund are expected to amount to $1,000,000:

A divorcée with a small child, was claiming unemployment insurance benefits. She had no saleable skill, so an Employment Service counselor tested and motivated her to accept training as a clerk-typist. After training she obtained work which she likes very much. She has now been on the job nine months and is making $305 per month.

Annual estimated savings in public assistance payments should approximate $1,000,000:

Savings in public assistance payments are illustrated by the case of a 38-year-old divorcée who was supporting her three dependent children on a small social security and veterans pension, plus a supplemental payment from the aid to needy children program.

She enrolled in an MDTA class for clerk-typist and made exceptional progress. After training she obtained work at a beginning salary of $332 per month and has now been on this job for almost a year.

Need for Retraining in California

During recent years the rapid advance in technology and the shift in the nation's economy have created a serious disparity between labor supply and demand. California has been and is expected to continue to be particularly vulnerable to these changes due to its exploding population growth and its high degree of dependence on defense-based industry.

These problems are exemplified by the statement of findings in the Federal Manpower Development and Training Act of 1962, which states in part:

> "The Congress finds that there is critical need for more and better trained personnel in many vital occupational categories, including professional, scientific, technical, and apprenticeable categories, that even in periods of high unemployment, many employment opportunities remain unfilled because of the shortages of qualified personnel; and that it is in the national interest that current and prospective manpower shortages be identified and that persons who can be qualified for these positions through education and training be sought out and trained *as quickly as is reasonably possible*, in order that the nation may meet the staffing requirements of the struggle for freedom. The Congress further finds that the skills of many persons have been rendered obsolete by dislocations in the economy arising from automation or other technological developments, foreign competition, relocation of industry, shifts in market demands, and other changes in the structure of the economy; that government leadership is necessary to insure that the benefits of automation do not become burdens of widespread unemployment; that the problem of assuring sufficient employment opportunities will be compounded by the extraordinarily rapid growth of the labor force in the next decade, particularly by the entrance of young people into the labor force . . . and that it is in the national interest that the opportunity to acquire new skills be afforded to these people with the least delay in order to alleviate the hardships of unemployment, reduce the costs of unemployment compensation and public assistance, and to increase the nation's productivity and its capacity to meet the requirements of the space age."

Occupation-centered training is not new in California. It has been pursued successfully for many years in vocational education programs in both public and private schools, in apprenticeship programs of labor and industry and in on-the-job training. In recent years these programs have been augmented by: (1) further expansion of the traditional vocational education program; (2) the California state retraining benefits program; (3) the California on-the-job training program; (4) the Area Redevelopment Act; and (5) the Manpower Development and Training Act.

VOCATIONAL EDUCATION IN CALIFORNIA

Some idea of the breadth of the California program of vocational education can be gained from the fact that in the 1963–64 period 1,034,000 individuals were enrolled in literally hundreds of occupation-centered courses, an increase of 51 percent over the 685,000 enrolled in 1962–63.

No small part of the widespread availability of such training has been the long-standing policy of the state's Department of Education with policy established by the State Board of Education to provide school districts with financial support for adult classes on a nontuition basis. Further impetus was given through assistance provided to local districts by federal funds supplied under such laws as the Smith-Hughes Act of 1917, the George Barden Act of 1946 as amended, and the National Defense Education Act of 1958.

A much greater measure of assistance is now available through the Vocational Education Act of 1963.

California's extensive vocational educational resources and tested experience grew through such prior cooperative activities as the federal emergency education program during the depression years, and the war production training program during World War II. This know-how has enabled California to be among the top leaders in providing vocational training.

Programs to

Meet the Need

CALIFORNIA STATE RETRAINING BENEFITS

The California Legislature recognized the need for retraining as early as 1959 when an amendment to the Unemployment Insurance Code made it possible for individuals in declining occupations to enroll in approved vocational training and still remain eligible for extended duration unemployment insurance benefits. This program was only available when the unemployment rate exceeded 6 percent and then only to those individuals who had exhausted their regular unemployment insurance claims and who were claiming extended duration benefits.

Because of these limitations, subsequent legislation in 1961 was enacted to broaden and strengthen the retraining provisions of the Unemployment Insurance Code. This legislation, referred to as the California state retraining benefits program or Senate Bill 20, has as its purpose:

> "Experience has shown that the ability of a large number of the population of California to compete for jobs in the labor market is impaired by advancement in technological improvements and the widespread effects of automation and relocation in our economy. It is the policy of this state to assist such individuals by providing unemployment compensation or extended duration benefits during a period of retraining to fit them for new jobs and thus avoid their being forced to remain in a job classification where work opportunities no longer exist or are diminishing."

The state retraining benefits program allows unemployed individuals whose work opportunities in their current occupation no longer exist or are diminishing, to enroll in an approved course of training and remain eligible for unemployment insurance benefits. The legal requirements to seek work and be available for work while claiming benefits are waived while the applicant is attending an approved training course. Existing vocational courses in public and private schools are used for this program. No special courses are established as is the case under MDTA. The program is limited in that the claimant must have a valid claim for unemployment insurance and must pay his own training costs.

Under the state retraining program, through December 1964, individuals approved for training totaled 9,317 including 5,257 male and 4,060 female. A total of 3,626 trainees have completed training. Of these 2,231 or 62 percent obtained employment within 30 days following completion of the course—89 percent in training-related jobs.

CALIFORNIA ON-THE-JOB TRAINING PROGRAM

Also in 1961, California Assembly Bill 2171 added Section 3093 to the Labor Code providing for the promotion and development of on-the-job training programs to supplement the traditional apprenticeship training programs. This program under the administration of the Division of Apprenticeship Standards, has provided on-the-job training for 973 trainees in several nonapprenticeable occupations.

AREA REDEVELOPMENT ACT

The Federal Area Redevelopment Act, approved May 1, 1961, provides direct financial assistance to economically distressed areas. In addition, the act has manpower training provisions which focus on providing the unemployed and underemployed residents of the designated area with an opportunity to acquire occupational skills. Training is limited in that the trainees cannot receive more than 16 weeks of allowance payments.

The impact of the Area Redevelopment Act has not been substantial in California. Of the 11 designated counties, only two have as many as 15,000 in their labor force. The other nine counties are sparsely populated and have lumber and wood products or agriculture as their principal industries. Through December 1964, two training projects have been approved under this act in California. One has been completed in Ukiah, and one is nearing completion in Modesto as this report goes to press.

The City of Oakland recently was designated as an ARA area, and the city has submitted several training proposals for approval under the act. These include courses for training ward maids, stenographers, clerk-typists, grocery checkers, and a refresher course for staff nurse. The courses are expected to start some time this year.

Meet the Need

MANPOWER DEVELOPMENT AND TRAINING ACT

OBJECTIVES

Primary objectives of the Manpower Development and Training Act can be summarized as follows: ". . . that improved planning and expanded efforts will be required to assure that men, women, and young people will be trained and available to meet shifting employment needs; that many persons now unemployed or underemployed, in order to become qualified for reemployment or full employment must be assisted in providing themselves with skills which are or will be in demand in the labor market; that the skills of many persons now employed are inadequate to enable them to make their maximum contribution to the nation's economy. . . . It is therefore the purpose of this act to require the federal government to appraise the manpower requirements and resources of the nation, and to develop and apply information and methods needed to deal with the problems of unemployment resulting from automation and technological changes and other types of persistent unemployment."

The objectives then of the Manpower Development and Training Act are to identify through the public employment service, present and future manpower shortages, seek out and train persons who can be qualified to fill these shortages through education and training, and give workers new skills to replace those outdated by technological developments and economic changes.

MANPOWER ADVISORY COMMITTEES

The act provides for advisory committees to be established on community, area and state levels consisting of representatives of community organizations, management, labor, and the state agencies involved in the MDTA program. These committees serve as advisors on matters of manpower development and provide leadership and community support to further the manpower development program.

Considerable guidance for the MDTA program is available also from the California Commission on Manpower, Automation and Technology, created by the California Legislature through Assembly Bill 49 signed into law on June 19, 1963, to which Governor Edmund G. Brown appointed outstanding representatives of the community, management, labor, the Legislature, and state agencies. The function of the commission is to study the impact of automated processes and technological developments on employment and the economy in general. A subcommittee of the commission, the State Manpower Advisory Committee, also has been established to cooperate with and assist the National Advisory Committee, as established by the MDT Act.

rovisions

ELIGIBILITY FOR TRAINING

Those eligible for training under the Manpower Development and Training Act include those who are:

1. Unemployed (includes members of farm families with less than $1,200 annual net family income);
2. Working below their skill capacities;
3. Working substantially less than full time;
4. Working or will be working less than full time or will be unemployed because their skills have become or are becoming obsolete, and
5. Those unemployed or underemployed youths 16 years of age or older who cannot be expected to obtain employment without training and schooling.

ELIGIBILITY FOR ALLOWANCES

Training allowances may be paid to those trainees who are unemployed, and

1. Have at least two years of experience in gainful employment, and are either head of a family or a household, or a member of a household in which the head of the household is unemployed, or
2. Are between the ages of 17 through 21 and require such training allowance in order to undertake training.

Subsistence payments and travel allowances are also provided for those who are enrolled in courses located outside the normal commuting distance of their regular place of residence.

STATE AGENCY RESPONSIBILITIES

The provisions of the act result in the delegation of certain responsibilities to related state agencies in California:

The California Department of Employment is responsible for:

1. Providing up-to-date information on the job market;
2. Identifying specific local employment possibilities;
3. Testing, selecting and counseling trainees;
4. Payment of allowances;
5. Providing followup counseling, job development and referral of trainees to jobs upon completion of their training courses.

The California Department of Education, Vocational Education Section (for the U.S. Secretary of Health, Education and Welfare), is responsible for development of curriculum of instruction for all classroom and laboratory training through contracts with qualified public and private schools. It arranges for classroom space, physical facilities, equipment and teachers.

MDTA
TRAINING
CENTER

California's 74 public junior colleges located throughout the state, each with comprehensive educational programs and available physical facilities, and each with staff personnel experienced in designing special vocational programs, provide an immediate accommodation for MDTA training. In addition, hundreds of adult education centers, long experienced in meeting the training and retraining needs of adults, are available to the MDTA program.

California's public schools cooperate to the fullest extent in providing the occupational training courses required to meet the varying needs of MDTA trainees. In spite of already overcrowded facilities, courses are designed; staff, space, supplies, and equipment are secured; and referred individuals are trained so they can secure and successfully engage in gainful employment.

California's private schools also contribute to the total training effort. These institutions have long experience in providing concentrated training designed to equip individuals for employment in many different occupations. Their resources are being well utilized. Approximately 15 percent of California's MDTA courses have been conducted in private schools.

The California Department of Industrial Relations, Division of Apprenticeship Standards, and the Bureau of Apprenticeship and Training of the U.S. Department of Labor (for the U.S. Secretary of Labor) are responsible for initiation and development of on-the-job training and apprenticeship programs.

The regular and long-established adult education system meets the need of the average individual; the person who wants to upgrade himself and can either devote full time to this end or can spend a few hours each week on self-improvement.

MDTA courses are specifically designed to attract and provide selected groups with the fundamentals and skills leading to gainful employment. These are the unemployed or underemployed who have either failed to recognize their own needs or have been financially unable to undertake training. These are the very people that Congress has mandated us to seek out and train as quickly as is reasonably possible. Thus MDTA is designed to reach certain segments of the work force who, for various reasons, either have not or cannot take advantage of existing opportunities for occupational training.

Training can be accomplished under the Manpower Development and Training Act in a manner not possible under traditional vocational educational programs. While the total number of training hours under both the traditional classroom methods and MDTA may be the same, MDTA courses are highly compressed into the shortest number of weeks possible. Trainees receive as much as 40 course-hours a week.

Why

MDTA

The unique sharing of responsibilities between the Departments of Education and Employment has resulted in training opportunities made available to many people not normally reached through adult education. The Department of Employment with its close contact with the unemployed and the Department of Education with its working relationships with California schools have been able to establish courses geared particularly to trainees unable to take advantage of the traditional vocational education opportunities. These include:

1. The unemployed head of household, who has no means of providing for himself or family to enable him to undertake extended training. The allowances provided MDTA trainees alleviate this situation and permit full-time concentration on learning.
2. The member of a minority race who, because of ghetto-like or other pernicious living condition has never experienced a work situation or, as is often the case, has never lived in a home with a breadwinner in the family. These people not only need the training but must be motivated to become an employed member of society. MDTA provides such motivation.
3. The functional illiterate who has not completed elementary school, let alone high school to enable him to assimilate training. He lacks the basic fundamentals and communication skills that are necessary to be occupationally trained. Basic education must be provided.

MDTA motivation is illustrated by a trainee enrolled in a precision lens grinder course who had a serious personality problem. Because of this he almost dropped out of training and at one point his dismissal by the training facility was being considered. Constant encouragement and cooperation of the instructor and his classmates kept him in training and helped him resolve his problem. He completed the training and is now employed.

INSTITUTIONAL PROJECTS

Institutional training is that training carried out in a classroom, a laboratory, or a school-connected situation, as contrasted to on-the-job training.

As the first step toward establishing an institutional training project, the Department of Employment conducts a survey of the labor market in the area where the training need is believed to exist. This survey establishes the extent of the demand for entry workers in the specific occupation and the number of qualified potential trainees. This information, properly documented, becomes a "work order" from which the Department of Education initiates development of the training course.

The Department of Education arranges with a local public or private school and assigns to it the task of preparing a course curriculum, recruiting instructional staff, and arranging for the necessary supplies and equipment, based on the survey document. The labor market survey document, a training cost budget, allowances budget, and course outline are then presented to a federal review team for approval.

When the project is approved, the local office of the California Department of Employment selects the necessary number of trainees. Applicants are screened against the basic qualifications set up for the course. Such things as educational achievement, aptitude test results, expressed interests, and prior work record are considered.

The Department of Employment also has responsibility for payment of training allowances, the referral of trainees to jobs upon completion of the course, and followup check on actual job performance. The Department of Education has the responsibility to oversee the conduct of the school training, to assure quality of instruction, and to provide reimbursement payments to the institution conducting the program.

From September 1962 and through December 31, 1964, approved institutional projects in California totaled 418, or 8 percent of the national total; and 26,330 trainee posi-

tions, or 9 percent of the national total. Through December, 5,698 trainees had completed training. Of these, 4,272 or 75 percent had obtained employment, of which 91 percent were in training-related occupations. The average budgeted cost per trainee in California for instruction and allowances was $1,293, compared with the national average cost of $1,391.

Training Projects

ON-THE-JOB-TRAINING

The Manpower Development and Training Act gives the Secretary of Labor the mandate to encourage, develop, and secure the adoption of on-the-job training programs—by individual employers and public and private groups, including states, public and private agencies, trade associations, labor organizations, and other industrial and community groups. This gives broad impetus to the establishment of diversified training programs which use the time-tested method of training while on the job.

Under MDTA regulations, on-the-job training is defined as training which uses instruction combined with work to qualify a trainee for a particular occupation. The key identifying feature of on-the-job training is the proximity of the training to the work environment. On-the-job training may be supplemented by classroom instruction conducted by the Department of Education and public schools.

Training allowance provisions of the act previously described apply equally to on-the-job training programs. However, the trainee must be paid prevailing wages by his employer for all hours of training spent in the production of marketable goods and services.

OJT projects are initiated and developed by the Division of Apprenticeship Standards (DAS), Department of Industrial Relations, under a reimbursement contract with the U.S. Department of Labor and in cooperation with the Federal Bureau of Apprenticeship and Training (BAT).

Once an on-the-job proposal has been found feasible, the Division of Apprenticeship Standards field representative assists the applicant organization, which is to become the project contractor, to complete a detailed outline of the project. Before approval the project proposal is cleared by the local and statewide coordinating committees composed of representatives from the Division of Apprenticeship Standards, Bureau of Apprenticeship and Training, Department of Employment and Department of Education. When the project is approved, a standard contractual agreement is executed between the project contractor (sponsor) and the Secretary of Labor.

The first on-the-job training project proposal in California was approved in May 1963. As of December 31, 1964, 26 projects authorizing 2,524 trainees had been approved. In addition to the approved projects, some 20 on-the-job training proposals are currently being developed by the Division of Apprenticeship Standards and the Federal Bureau of Apprenticeship and Training.

If on-the-job training is to be supplemented by classroom instruction, the Department of Education provides this training. The Department of Education arranges with a local school district for the necessary facilities and approves the supplemental curriculum.

The Department of Employment verifies the need for training and assists in screening the applicants.

EXPERIMENTAL AND DEMONSTRATION PROJECTS

These are projects designed to experiment with and develop more effective methods and techniques to train unemployed people with particularly difficult employment problems. Unemployed school dropouts, migratory workers, older workers, socially and economically deprived persons, and functional illiterates, among others, have special occupational needs that are being identified and met in experimental and demonstration projects.

The projects supplement standard MDTA programs by adding special techniques of testing, counseling, guidance, training, remedial educational instruction, job development, placement, and followup counseling after job placement.

Techniques are devised for locating the hard-core unemployed, and then guiding them into training programs.

After training and placement the Department of Employment provides any necessary counseling services to assist them in adjusting to the demands of the job.

Seven projects are now operating in California; others are pending. The seven include Youth Opportunity Board projects in east Los Angeles and south central Los Angeles which involve counseling, motivation, testing, job development, training (basic education and vocational) and research on methods and techniques for upgrading the minority youth, predominantly Mexican American in east Los Angeles, and Negro in south central Los Angeles. MDTA is involved in the Richmond Neighborhood House, a job upgrading project designed to prepare the dropout and other unemployed young people for employment. The Visalia farm labor project training farm workers in Tulare County combines basic education with training in year-round skills. A project in San Francisco is designed to determine how best to serve employment needs of workers over age 60. A project in the Castlemont area of Oakland, predominantly Negro, provides some 1,500 adult males a specialized placement service, including counseling, testing, motivation, job development, and basic education. Lastly, a project in Santa Barbara to counsel, motivate and train 300 adults, the majority of whom are ex-migrant workers.

Characteristics of the MDTA Trainees

Employment Status. Almost all trainees were unemployed at the time of enrollment in the courses. Nearly half of the trainees had been out of work more than 14 weeks when they entered the training program, and a good many had been jobless for more than a year. A preponderance of those unemployed more than a year were women. Approximately 60 percent of the male trainees enrolled had been out of work less than 15 weeks (Table A in the appendix).

Years in the Labor Force. Most trainees enrolled in manpower training had more than three years of gainful employment. Almost half of the male trainees had 10 years or more work experience with 82 percent having at least three years. Almost half of the female trainees had three to nine years of work experience and almost a quarter had 10 years or more (Table B in the appendix).

Age. The manpower development and training program in California is training a substantial number of youth. Through December of 1964, 3,151 trainees, or 23 percent, were under the age of 22. This percentage will no doubt increase as numerous special training projects for disadvantaged youth get underway. There are 2,035,000 youth in California aged 14 through 20. About half of these are in the labor force on a full- or part-time basis, and the unemployment rates for youth are known to be at least double the rates for the labor force as a whole. It is estimated that the number of youth aged 14 through 20 will climb to 3,052,000 by the year 1975. Many of these youth will continue to enter the work force with little or no skills unless programs such as MDTA are continued on an expanded basis.

An example of MDTA service to youth is a young man, 20 years old, who resides in an extremely dilapidated area of a large city. He has enrolled in a telephone frameman course and has already been hired part time by a telephone company with a promise of fulltime permanent employment when he completes the MDTA course.

Older workers are being trained in substantial numbers. Through December of 1964, over 17 percent of the trainees in California were over the age of 45 (Table C in the appendix).

Service to older workers is illustrated by the case of a 59-year-old housewife who became major support of the family when her husband became ill and unable to work. She completed an MDTA stenographer course, with "flying colors," and has been successfully employed as a private secretary for a legal concern for almost a year.

Race. Since the Department of Employment began gathering racial data on claimants and applicants on September 1, 1963, information on participation of minority groups in the manpower development and training program is now available. From September 1963 through December 1964, 23 percent of the trainees enrolled were Negroes, 12 percent Mexican Americans, and 2 percent other nonwhites (Table D in the appendix).

Outstanding illustrations of minority participation in the MDTA program are found in a recently completed precision lens grinder course.

For example, a Negro trainee whose most significant job had been as an assembler at $1.65 an hour, was tested, counseled and found to be working far below his potential skill level. He enrolled in and successfully completed the course. He is believed to be the first of his race to work as a precision lens grinder.

Two other successful trainees from this course are the first Mexican Americans hired for technical work in the optics industry.

Family Status. Through December of 1964, 56 percent of the trainees were heads of family or household; 48 percent of the female trainees were heads of family or household. While female trainees outnumbered male trainees by almost 3 to 1, a substantial number of female trainees were the major support of the household (Table E in the appendix).

Education. Fifty percent of the manpower trainees had a high school education. At the other end of the scale, approximately 8 percent of the manpower trainees had no more than an eighth grade education (Table F in the appendix).

THE JOBS TRAINEES LEARNED

Institutional training has been approved for 73 different occupations. These are enumerated in Table G in the appendix. The main direction of this education and training has been toward the clerical occupations, which embraced 46 percent of all approved projects. Other areas of emphasis included training for service occupations (14 percent), professional and managerial occupations (16 percent), agricultural occupations (10 percent), skilled occupations, (7 percent), and semiskilled occupations (7 percent).

Clerical and Sales. Clerical courses have been predominantly in the fields of stenography and typing, many of which were aimed at bringing skills up to the level necessary to compete in the labor market. Those trained in other clerical and sales courses were predominantly without clerical experience but demonstrated aptitude through our testing program.

A unique course in this field was for salesman, building and construction equipment and supplies, a 41-week course which trained 15 men in all phases of the retail lumber business. The success of the course led to repeating it for 20 more trainees.

Service. Courses in nurse aide and hospital orderly have been the most rewarding of those offered in service fields. They vary in length from 8 to 10 weeks and include classroom and practical training in the elements of patient care, aiding nurses, and institutional housekeeping. Custodian courses for males also have been successful.

Professional and Managerial. Among these occupations, the most predominant training has been for licensed vocational nurse. The content and length of these courses conform to both hospital and state requirements. Generally, these courses are 48 to 52 weeks in duration.

Agricultural. California leads all other states in the establishment of agricultural training courses. Most of the courses are for the occupations of pruner and nurseryman. These courses have been successful in aiding the unskilled farm worker to lengthen his work season and consequently increase his earning power. The farm employer also has benefited by having trained workers available.

Semiskilled. In this category, the largest number of courses has been for electronic assembler and machine operator. In addition, courses for coin machine serviceman and instrument assembler have been offered.

Skilled. Within this group, courses for electronic technician and welder have been in highest demand. Most of these courses have been 40 weeks or more in duration.

In some instances basic literacy courses have been added to the above types of vocational training. These courses are designed for those among the long-term unemployed who cannot benefit by vocational training programs until they have acquired at least minimal ability to read and write.

The Economic Impact

Earnings. Assuming a conservative estimate of $4,300 annual wage for each trainee returned to productive employment, the projected gross annual earnings of the retrained would amount to about $16,000,000. When trainees currently in training graduate and enter the labor market, the gross annual earnings will approach $30,000,000. The gross earnings of MDTA trainees will of course continue to rise as the program expands and the workers' annual wages increase.

The earnings impact is exemplified by a parolee who enrolled in an MDTA welding course. He has now completed the training and is employed as a maintenance man at $120 per week.

Unemployment Insurance. Assuming that as few as one-quarter of the 13,754 trainees who so far have been enrolled, would have been claiming an average of $44 each week in unemployment insurance benefits, the savings to the Unemployment Insurance Fund would be more than $1,000,000 annually. This estimated saving will increase as the program continues to return the unemployed to productive work.

A case study illustrating unemployment insurance savings is that of a young mother who is supporting her invalid husband and two small children. During the past five years she has worked at three different occupations for five different employers. Prior to enrollment in an MDTA course she had been claiming unemployment insurance benefits for about six months. Four employers scheduled her for interviews when they observed her work while visiting the class. She was hired as an electronics assembler with good prospects of being promoted to lead lady.

Public Assistance. Approximately 13 percent of the trainees referred to MDTA training have been recipients of public assistance. Most of these individuals have been mothers with dependent children. The average public assistance payments under the Aid to Families with Dependent Children program is about $170 per month. An annual saving of about $1,000,000 in public assistance payments will accrue as this group becomes employed. Again, these estimated savings will increase as the program continues and more public assistance recipients are returned to gainful employment.

A typical example of savings in public assistance payments is that of a 37-year-old handicapped woman with four dependent children and a disabled husband. This family was receiving welfare assistance.

She enrolled in an MDTA clerk-typist course and earned a certificate of completion in spite of absences caused by major surgery. She obtained her assignments by telephone so that she could keep up with the class during the period she was absent.

She has now been placed in a job where she has already received a raise in salary.

To realize the full impact of these estimates it should be remembered that the above projections are for one year only and most of the trainees will probably be gainfully employed during succeeding years, thus multiplying the projected earnings and savings many times. Further benefits will be realized as these workers assume their share of the tax load.

Accomplishments under the Manpower Development and Training Act program to date are the more remarkable in the face of problems encountered in a truly "crash" program of this magnitude.

Problems

LIMITATIONS ON MALE TRAINEES

A review of the statistics will show that only 29 percent of the trainees enrolled in California are males. This is in contrast to the national figures of almost 61 percent males enrolled. Primarily this disparity is attributed to:

1. A highly developed system of vocational education in California that enrolled 1,034,000 individuals in hundreds of courses in 1963–64. Male participation in this program is very high.

2. California's leadership in the apprenticeship training program with over 22,000 active apprentices in fiscal year 1963. Because of this activity, there are many opportunities for males to train in the skilled trades through the ongoing apprenticeship programs.

3. Many women are heads of family or household. At the same time there is a long-standing shortage of trained people in such occupations as typists, stenographers and nurse aides where courses can be readily established.

4. The questions raised by some segments of organized labor concerning the advisability of MDTA institutional training in some occupations suitable for men. While these questions have been under resolution, we have deferred training in some semiskilled and skilled occupations in which males could participate.

FRAGMENTING SKILLS

Some question has been raised also that MDTA encourages unnecessary fragmentation of skills. If there is a fragmentation of skills, it is a reflection of the impact of technological developments on the labor market and not of the purpose or objectives of the MDTA program. MDTA projects are based on facts about present and prospective

manpower shortages. The labor market has to be taken as it is constituted. It is not the purpose of MDTA to dictate to management and labor the specifics of any job in any industry and negotiations in this area are better left to the collective bargaining process.

ON-THE-JOB VS. CLASSROOM TRAINING

Despite the fact that it has been demonstrated that there are many occupations in which skills can be imparted just as effectively in classroom training as in on-the-job training, there is still reluctance to accept this fact. Furthermore, on-the-job training is much more difficult to establish since employers must assume some of the costs involved even with the inducements offered by MDTA. And of greater importance is the fact that in many instances the employer's plant facilities do not allow for trainees, at least to any appreciable extent. For these reasons California is vigorously pursuing all training resources available. Relying only on the traditional methods for any given occupations would sharply curtail our ability to meet California's growing needs.

APPRENTICESHIP

Apprenticeship in California has done, and is continuing to do, a fine job in adding skilled craftsmen to our labor force. There is no doubt that an effective apprenticeship program is vitally necessary. Yet, there are a number of important occupations considered apprenticeable which have not had a registered apprentice for several years. For example, in fiscal year 1963 there were 368 occupations regarded as apprenticeable in California. Of the 22,116 active apprentices in these occupations, 20,016 or over 90 percent were registered in only 31 occupations; an additional 2,100 apprentices were registered in 127 other occupations. No active apprentices were registered in the remaining 210 occupations.

If there is no ongoing or planned apprenticeship program in a particular occupation and a demand for workers exists, MDTA programs should be established and

employers be encouraged to accept graduates as entry workers.

OCCUPATIONAL OBSOLESCENCE

For every proposed MDTA project, a careful survey is made to determine the present and future employment needs for the occupation. As a result of these careful studies, few if any of the occupations approved for training under MDTA show any signs of becoming obsolete in the immediate future.

Further, even if an occupation does become obsolete after a number of years, the trainees will still have a base upon which to build additional skills that may be in demand at that time. In the meantime the MDTA graduates have become productive members of society.

TRAINING THE FUNCTIONAL ILLITERATES

Initially a rigid interpretation was applied to the requirement that there be reasonable expectation of employment for the graduates of MDTA courses. This requirement led to the elimination of many functional illiterates who constitute the hard-core unemployed in California. Hearings before congressional committees resulted in an amendment to MDTA to allow payment of training allowances for an additional 20 weeks to provide for literacy and basic education coupled with vocational training. There are now 14 such projects approved in California that will accommodate over 5,000 trainees. In addition, many of the regular projects now being developed have provisions for remedial or basic education. Therefore, this amendment along with the new experimental and demonstration project techniques previously described, have made it possible to reach more of the educationally deficient, a major part of the hard-core unemployed.

LOW PERCENTAGE OF MEXICAN AMERICANS IN TRAINING

The Mexican American population in California in 1960 was 1.4 million or 9 percent of the total state population, the largest single minority group in California.

However, if agricultural occupations are excluded, the number of Mexican Americans enrolled in MDTA training is very low in comparison to their representation in the population as a whole.

As a group the Mexican Americans average 8.6 years of education, substantially less than the average for the state as a whole. This factor along with economic and social barriers, general lack of preparation, and language difficulties have thrown serious roadblocks in efforts to train many Mexican Americans under MDTA.

With the emphasis presently being placed on training the hard-core unemployed, new efforts will be made to include Mexican Americans in all types of MDTA training. Promising programs in this direction have already been initiated and approved for the Los Angeles and the San Francisco Bay areas.

MDTA FUNDING

The Manpower Development and Training Act when first enacted, called for the several states to provide one-half of the costs of training and allowances beginning July 1, 1964.

The act has since been amended and now calls for the states to provide one-third of the costs of training and allowances beginning July 1, 1965, and one-half of the costs of training and allowances in succeeding years. If any state does not appropriate the necessary funds as called for in the act, the program will not be operative in that state after June 30, 1965.

For the fiscal year 1964–65, $307,000,000 was appropriated by Congress for national use. California has been tentatively allocated $29,988,000 of this amount. For fiscal year 1965–1966, the first matching year, a $30,000,000 program is possible of which $20,000,000 would be federal funds and $10,000,000 state matching funds.

In California, difficulties are already being experienced in establishing training that will extend beyond June 30, 1965. Some educational facilities are understandably re-

luctant to undertake the training without assurances that their costs will be fully reimbursed. Many potential trainees do not have the financial capability to continue training without allowances after June 30, 1965, and so cannot accept the training opportunity.

These difficulties have resulted in a noticeable slowdown in the program, a situation that will become even more acute as the period of full federal financing approaches termination.

Results of MDTA Training

PRECISION LENS GRINDER COURSE

Among the outstanding successes in California's MDTA experience was the course for precision lens grinder which concluded at Citrus College, Monrovia, November 6, 1964. Twelve trainees, all males and heads of families, ranging in age from 19 through 33 years, completed the course. All had at least two tentative job offers; one individual had six offers.

One trainee, who had a police record, completed the training among the top of his class. He had two offers from employers who were aware of his record. He intends to accept employment in Massachusetts at $2.50 per hour to start.

Another trainee, a high school dropout, had a juvenile conviction. He was tendered three firm and three tentative job offers.

Another trainee who finished in the top five had considerable difficulty in comprehension of the material at the start of the course. Efforts by the instructor and other members of the class got him started and he later moved up to the top of the class. He accepted employment in Palo Alto to work in research in rare earth crystals and quartz requiring ultra high precision.

San Rafael, Clerk, General Office

A 51-year-old trainee, with no recent work history, was rated by the instructor as one of the four highest students in the class, despite the handicap of polio of the right leg which caused the trainee considerable difficulty in maintaining class attendance and participation in all training sessions. She was selected by an employer to fill a job opening in a one-girl office.

Glendale, Electronics Assembly

A 40-year-old applicant, out of the labor market for 12 years and with her entire experience limited to routine clerical work and as a beauty shop helper, was found after counseling and testing to be qualified for training as an electronics assembler. A job has already been lined up for her when she completes the course.

San Rafael, General Office Clerk

A 49-year-old trainee had done no office work since 1945 and had been able to obtain only waitress work. She did so well in class that she was placed immediately with a manufacturing concern as combination receptionist and clerk, general office.

Hayward, Licensed Vocational Nurse

A male trainee had been under the care of Alcoholics Anonymous prior to enrolling in the course. Despite successful completion of the 48-week course, without reverting back to his prior problem, he still was faced with employer resistance. Through extensive job development efforts he was placed in a job with a large San Francisco hospital.

Tree Pruning Course

"It was a revelation to the instructors to watch speed develop in men that two or three days previous had never held a shear in their hands. One orchard last year required 77 minutes on the average to prune a tree. A group of trainees after only three days was pruning trees at a rate of 70 minutes per tree."

Draftsman Course

The instructor for this course reports: "I think we can claim pretty good success. Frankly, at the start, because of the intensive schedule, I didn't think the class would last more than a month. It's been 1,000 percent better than anything I had anticipated."

Santa Rosa Clerk-typist

"I have been drawing aid for needy children for approximately one year . . . I tried to obtain employment but it seemed I did not have enough experience or knowledge . . . It is important to me to be able to support my three small children, and with this training I know I can."

Sacramento Draftsman

"It was a long program and tough course, but it was well worth while . . . It's a real good deal. I'm well satisfied. If it hadn't been for the school I never would have gotten hired."

Antelope Valley Stenographer

"Thank you for the privilege of having been able to attend the MDTA stenographic training school. I can't begin to tell you what it has done for me. I knew I was capable of doing the work, but through the teaching . . . I gained back the confidence I lacked and the initiative to go out and seek the work which I most enjoyed . . ."

San Bernardino Stenographer

"It's a wonderful feeling. Now I'll have something that can't ever be taken away from me."

Lancaster Stenographer

"This opportunity is just fantastic and I can't rave enough about this program . . . I just hope that my slow old brain will hurry up and get used to being filled up with knowledge again . . . It is a frightening thing to return to school after so many years away from it but it is fascinating too, and I really do enjoy it a lot . . ."

San Jose Stenographer

A 51-year-old divorcée with two dependent children was insistent that she would not accept assistance in the form of aid to needy children. She was confident that, in spite of a background that was predominantly industrial (now precluded for physical reasons), she could do well in office work.

Inspired by her successful completion of the MDTA stenographer course, she took and passed the GED test and made the 12th grade equivalency.

She was hired immediately on a part-time job, which was soon changed to full time. Her employer reports she is doing an excellent job.

This handicapped, independent "graduate" fulfilled her determination not to become a recipient of welfare aid. In addition, based on her knowledge of the effectiveness of her training, she has attempted to get other MDTA graduates into her office.

San Jose Nurse Aide

A 55-year-old married woman from a culturally disadvantaged group had a consuming urge to become a nurse aide. Her eighth grade education had limited her employment opportunities during the 20 years she had spent in cannery work.

A discerning interviewer realized that the results of the aptitude test were only one of the selection factors to be considered and correctly referred her to training after all other factors had been considered.

While slow to learn and average in grooming, her instructors considered her exceptional in every other respect, characterizing her as, "hard working, forceful, kind, a jewel."

Employed shortly after the completion of the training by a small hospital, this older worker from a culturally deprived group is still gainfully employed in the occupation to which she has always aspired.

CONCLUSION

Accomplishments to date under the MDTA program have been sufficiently encouraging, in what is still relatively a new program, to warrant greater effort to meet our challenging manpower problems.

As can be seen from this report, the MDTA program has been a success. It has demonstrated that the unemployed can be trained to fill today's jobs. It is also evident that only a start has been made. Continuation of the program in future years is vitally necessary so that further inroads can be made in reducing the ranks of the unemployed.

The assistance of legislators, educators, organized labor, businessmen and private citizens is welcomed so that the finest possible program can be developed.

APPENDIX

RETRAINING FACTS AND FIGURES

EMPLOYMENT AND UNEMPLOYMENT DATA (calendar year 1964)

California: 7,064,000 work force
422,000 unemployed
or 6.0 percent of work force

Nationally: 74,233,000 work force
3,867,000 unemployed
or 5.2 percent of work force

MDTA INSTITUTIONAL (school-connected) PROJECTS IN CALIFORNIA
(September 1962 through December 31, 1964)

418 approved projects, or 8 percent of national total.
26,330 trainee positions,* or 9 percent of national total.
14,957 individuals referred to training.
13,754 individuals enrolled in classes.
Male: 3,950; female: 9,804
(Included are 3,151 youth)
7,737 heads of household enrolled in classes.
Male: 3,053; female: 4,684
5,698 completed MDTA training.
4,272 or 75 percent placed on jobs after MDTA training, of which 3,876 or 91 percent placed in training-related jobs.

MDTA ON-THE-JOB TRAINING IN CALIFORNIA

26 approved projects.
2,524 trainee positions.

MINORITY PARTICIPATION IN INSTITUTIONAL MDTA
(September 1, 1963, through December 31, 1964)

9,646 trainees enrolled, all races.
2,216 or 23 percent Negro.
1,152 or 12 percent Mexican American.
6,082 or 63 percent other white.
150 or 2 percent other nonwhite.
46 not identified as to race.

FUNDING FOR MDTA

$161,000,000 authorized nationally for fiscal year 1964, of which
$110,000,000 appropriated.
$10,350,680 committed for projects in California.
$407,000,000 authorized nationally for fiscal year 1965, of which
$307,000,000 appropriated, $29,988,000 tentatively allocated for California.
$30,000,000 program possible in California for fiscal year 1966, of which
$20,000,000 would be federal funds and $10,000,000 state matching.

* "Trainee positions" are those training openings for which funds have been budgeted. Many approved courses and sections of courses have not as yet started.

MANPOWER DEVELOPMENT AND TRAINING ACT OF 1962 AS AMENDED[1]
(42 U.S.C. 2571–2620)

AN ACT

Relating to manpower requirements, resources, development, and utilization, and for other purposes.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That this Act may be cited as the "Manpower Development and Training Act of 1962".

TITLE I—MANPOWER REQUIREMENTS, DEVELOPMENT, AND UTILIZATION

Statement of Findings and Purpose

SEC. 101. The Congress finds that there is critical need for more and better trained personnel in many vital occupational categories, including professional, scientific, technical, and apprenticeable categories; that even in periods of high unemployment, many employment opportunities remain unfilled because of the shortages of qualified personnel; and that it is in the national interest that current and prospective manpower shortages be identified and that persons who can be qualified for these positions through education and training be sought out and trained as quickly as is reasonably possible, in order that the Nation may meet the staffing requirements of the struggle for freedom. The Congress further finds that the skills of many persons have been rendered obsolete by dislocations in the economy arising from automation or other technological developments, foreign competition, relocation of industry, shifts in market demands, and other changes in the structure of the economy; that Government leadership is necessary to insure that the benefits of automation do not become burdens of widespread unemployment; that the problem of assuring sufficient employment opportunities will be compounded by the extraordinarily rapid growth of the labor force in the next decade, particularly by the entrance of young people into the labor force, that improved planning and expanded efforts will be required to assure that men, women, and young people will be trained and available to meet shifting employment needs; that many persons now unemployed or underemployed, in order to become qualified for reemployment or full employment must be assisted in providing themselves with skills which are or will be in demand in the labor market; that the skills of many persons now employed are inadequate to enable them to make their maximum contribution to the Nation's economy; and that it is in the national interest that the opportunity to acquire new skills be afforded to these people with the least delay in order to alleviate the hardships of unemployment, reduce the costs of unemployment compensation and public assistance, and to increase the Nation's productivity and its capacity to meet the requirements of the space age. It is therefore the purpose of this Act to require the Federal Government to appraise the manpower requirements and resources of the Nation, and to develop and apply the information and methods needed to deal with the problems of unemployment resulting from automation and technological changes and other types of persistent unemployment.

Evaluation, Information, and Research

SEC. 102. To assist the Nation in accomplishing the objectives of technological progress while avoiding or minimizing individual hardship and widespread unemployment, the Secretary of Labor shall—

(1) evaluate the impact of, and benefits and problems created by automation, technological progress, and other changes in the structure of production and demand on the use of the Nation's human resources; establish techniques and methods for detecting in advance the potential impact of such developments; develop solutions to these problems, and publish findings pertaining thereto;

(2) establish a program of factual studies of practices of employers and unions which tend to impede the mobility of workers or which facilitate mobility, including but not limited to early retirement and vesting provisions and practices under private compensation plans; the extension of health, welfare, and insurance benefits to laid-off workers; the operation of severance pay plans; and the use of extended leave plans for education and

[1] P.L. 87–415, Mar. 15, 1962, 76 Stat. 24–33, as amended by P.L. 87–729, Oct. 1, 1962, 76 Stat. 679; as amended by P.L. 88–214, Dec. 19, 1963.

training purposes. A report on these studies shall be included as a part of the Secretary's report required under section 104;

(3) appraise the adequacy of the Nation's manpower development efforts to meet foreseeable manpower needs and recommend needed adjustments including methods for promoting the most effective occupational utilization of and providing useful work experience and training opportunities for untrained and inexperienced youth;

(4) promote, encourage, or directly engage in programs of information and communication concerning manpower requirements, development, and utilization, including prevention and amelioration of undesirable manpower effects from automation and other technological developments and improvement of the mobility of workers; and

(5) arrange for the conduct of such research and investigations as give promise of furthering the objectives of this Act.

Skill and Training Requirements

SEC. 103. The Secretary of Labor shall develop, compile, and make available, in such manner as he deems appropriate, information regarding skill requirements, occupational outlook, job opportunities, labor supply in various skills, and employment trends on a National, State, area, or other appropriate basis which shall be used in the educational, training, counseling, and placement activities performed under this Act.

Manpower Report

SEC. 104. The Secretary of Labor shall make such reports and recommendations to the President as he deems appropriate pertaining to manpower requirements, resources, use, and training; and the President shall transmit to the Congress within sixty days after the beginning of each regular session (commencing with the year 1963) a report pertaining to manpower requirements, resources, utilization and training.

TITLE II—TRAINING AND SKILL DEVELOPMENT PROGRAMS

PART A—DUTIES OF THE SECRETARY OF LABOR

General Responsibility

SEC. 201. In carrying out the purposes of this Act, the Secretary of Labor shall determine the skill requirements of the economy, develop policies for the adequate occupational development and maximum utilization of the skills of the Nation's workers, promote and encourage the development of broad and diversified training programs, including on-the-job training, designed to qualify for employment the many persons who cannot reasonably be expected to secure full-time employment without such training, and to equip the Nation's workers with the new and improved skills that are or will be required.

Selection of Trainees

SEC. 202. (a) The Secretary of Labor shall provide a program for testing, counseling, and selecting for occupational training under this Act those unemployed or underemployed persons who cannot reasonably be expected to secure appropriate full-time employment without training. Workers in farm families with less than $1,200 annual net family income shall be considered unemployed for the purpose of this Act.

(b) Whenever appropriate the Secretary shall provide a special program for the testing, counseling, selection, and referral of youths, sixteen years of age or older, for occupational training and further schooling, who because of inadequate educational background and work preparation are unable to qualify for and obtain employment without such training and schooling.

(c) Although priority in referral for training shall be extended to unemployed persons, the Secretary of Labor shall, to the maximum extent possible, also refer other persons qualified for training programs which will enable them to acquire needed skills. Priority in referral for training shall also be extended to persons to be trained for skills needed within, first, the labor market area in which they reside and, second, within the State of their residence.

(d) The Secretary of Labor shall determine the occupational training needs of referred persons, provide for their orderly selection and referral for training under this Act, and provide counseling and placement services to persons who have completed their training, as well as follow-up studies to determine whether the programs provided meet the occupational training needs of the persons referred.

(e) Before selecting a person for training, other than for training under subsection (i), the Secretary shall determine that there is a reasonable expectation of employment in the occupation for which the person is to be trained. If such employment is not available in the area in which the person resides, the Secretary shall obtain reasonable

assurance of such person's willingness to accept employment outside his area of residence.

(f) The Secretary shall not refer persons for training in an occupation which requires less than two weeks training, unless there are immediate employment opportunities in such occupation.

(g) The duration of any training program to which a person is referred shall be reasonable and consistent with the occupation for which the person is being trained.

(h) Upon certification by the responsible training agency that a person who has been referred for training does not have a satisfactory attendance record or is not making satisfactory progress in such training absent good cause, the Secretary shall forthwith terminate his training and subsistence allowances, and his transportation allowances except such as may be necessary to enable him to return to his regular place of residence after termination of training, and withdraw his referral. Such person shall not be eligible for such allowances for one year thereafter.

(i) Whenever appropriate, the Secretary of Labor may also refer for the attainment of basic education skills those eligible persons who indicate their intention to, and will thereby be able to, pursue courses of occupational training of a type for which there appears to be reasonable expectation of employment. Such referrals shall be considered a referral for training within the meaning of this Act, and such person shall be eligible for training allowances for not to exceed an additional twenty weeks.

Training Allowances

SEC. 203. (a) The Secretary of Labor may, on behalf of the United States, enter into agreements with States under which the Secretary of Labor shall make payments to such States either in advance or by way of reimbursement for the purpose of enabling such States, as agents for the United States, to make payment of weekly training allowances to unemployed persons selected for training pursuant to the provisions of section 202 and undergoing such training in a program operated pursuant to the provisions of the Act. Such payments shall be made for a period not exceeding fifty-two weeks, (except where authorized for individuals referred for training under section 202(i)), and the amount of any such payment in any week for persons undergoing training, including uncompensated employer-provided training, shall not exceed $10 more than the amount of the average weekly unemployment compensation payment (including allowances for dependents) for a week of total unemployment in the State making such payments during the most recent quarter for which such data are available: *Provided however*, That in any week an individual who, but for his training, would be entitled to unemployment compensation in excess of such allowance, shall receive an allowance increased by the amount of such excess. With respect to Guam and the Virgin Islands the Secretary shall by regulation determine the amount of the training allowance to be paid any eligible person taking training under this Act.

With respect to any week for which a person receives unemployment compensation under title XV of the Social Security Act or any other Federal or State unemployment compensation law which is less than $10 more than the average weekly unemployment compensation payment (including allowances for dependents) for a week of total unemployment in the State making such payments during the most recent quarter for which such data are available, a supplemental training allowance may be paid to a person eligible for a training allowance under this Act. This supplemental training allowance shall not exceed the difference between his unemployment compensation and $10 more than the average weekly unemployment compensation payment referred to above.

For persons undergoing on-the-job training, the amount of any payment which would otherwise be made by the Secretary of Labor under this section shall be reduced by an amount which bears the same ratio to that payment as the number of compensated hours per week bears to forty hours.

The training allowance of a person engaged in full-time training under section 231 shall not be reduced on account of his part-time employment which does not exceed twenty hours per week, but shall be reduced in an amount equal to his full earnings for hours worked in excess of twenty hours per week.

(b) The Secretary of Labor is authorized to pay to any person engaged in training under this title, including compensated full-time on-the-job training, such sums as he may determine to be necessary to defray transportation and subsistence expenses for separate maintenance of such persons when such training is provided in facilities which are not within commuting distance of their regular place of residence: *Provided*, That the Secretary in defraying such subsistence expenses shall not afford any individual an allowance exceeding $35 per week, at the rate of $5 per day;

nor shall the Secretary authorize any transportation expenditure exceeding the rate of 10 cents per mile.

(c) The Secretary of Labor shall pay training allowances only to unemployed persons who have had not less than two years of experience in gainful employment and who are either heads of families or heads of households as defined in the Internal Revenue Code of 1954, or who are members of a household in which the head of the household or the head of the family is unemployed: *Provided*, That not more than one person in any one household may be receiving training allowances under this Act at any particular time. Notwithstanding the preceding sentence, the Secretary may pay training allowances at a rate not in excess of $20 a week to youths seventeen years of age or older who require such training allowance in order to undertake training, who are referred for training in accordance with section 202(b), and who are not entitled to allowances under the preceding sentence, except that no such training allowance shall be paid to any such youth who has not graduated from high school, unless the Secretary has satisfied himself that such youth has continuously failed to attend school for a period of not less than one year and that the local authorities after pursuing all appropriate procedures, including guidance and counseling, have concluded, after considering any assistance available under section 13 of the Vocational Education Act of 1963, that further school attendance by such youth in any regular academic or vocational program is no longer practicable under the circumstances. Not more than 25 per centum of the persons who are receiving training allowances (or who would be entitled thereto but for receipt of unemployment compensation) may be youths under the age of twenty-two.

(d) For the fiscal year ending June 30, 1966, any amount paid to a State for training allowances under this section, or as reimbursement for unemployment compensation under subsection (h), shall be paid on condition that such State shall bear 33⅓ per centum of the amount of such payments, and for each fiscal year thereafter such amounts shall be paid on condition that such State shall bear 50 per centum of the amount of such payments.

(e) No training allowance shall be made to any person otherwise eligible who, with respect to the week for which such payment would be made, has received or is seeking unemployment compensation under title XV of the Social Security Act or any other Federal or State unemployment compensation law, but if the appropriate State or Federal agency finally determines that a person denied training allowances for any week because of this subsection was not entitled to unemployment compensation under title XV of the Social Security Act or such Federal or State law with respect to such week, this subsection shall not apply with respect to such week.

(f) A person who refuses, without good cause, to accept training under this Act shall not, for one year thereafter, be entitled to training allowances.

(g) Any agreement under this section may contain such provisions (including, as far as may be appropriate, provisions authorized or made applicable with respect to agreements concluded by the Secretary of Labor pursuant to title XV of the Social Security Act) as will promote effective administration, protect the United States against loss and insure the proper application of payments made to the State under such agreement. Except as may be provided in such agreements, or in regulations hereinafter authorized determinations by any duly designated officer or agency as to the eligibility of persons for weekly training allowances under this section shall be final and conclusive for any purposes and not subject to review by any court or any other officer.

(h)(1) If State unemployment compensation payments are paid to a person taking training under this Act and eligible for a training allowance, the State making such payments shall be reimbursed from funds herein appropriated. The amount of such reimbursement shall be determined by the Secretary of Labor on the basis of reports furnished to him by the States and such amount shall then be placed in the State's unemployment trust fund account.

(2) If employment benefits under the Railroad Unemployment Insurance Act are paid to a person taking training under this Act and eligible for a training allowance, the railroad unemployment insurance account in the unemployment trust fund shall be reimbursed, from funds herein appropriated, for all of such benefits paid prior to July 1, 1965, for 66⅔ per centum of the amount of such benefits paid during the fiscal year ending June 30, 1966, and 50 per centum of the amount of such benefits paid thereafter. The amount of such reimbursement shall be determined by the Secretary of Labor on the basis of reports furnished to him by the Railroad Retirement Board and such amount shall then be placed in the railroad unemployment insurance account.

(i) A person who, in connection with an occupational training program, has received a training allowance or whose unemployment compensation payments were reimbursed under the provisions of this Act or any other Federal Act shall not be entitled to training allowances under this Act for one year after the completion or other termination (for other than good cause) of the training with respect to which such allowance or payment was made.

(j) No training allowance shall be paid to any person who is receiving training for an occupation which requires a training period of less than six days.

On-the-Job Training

SEC. 204. (a) The Secretary of Labor shall encourage, develop, and secure the adoption of programs for on-the-job training needed to equip persons selected for training with the appropriate skills. The Secretary shall, to the maximum extent possible, secure the adoption by the States and by private and public agencies, employers, trade associations, labor organizations and other industrial and community groups which he determines are qualified to conduct effective training programs under this title of such programs as he approves, and for this purpose he is authorized to enter into appropriate agreements with them.

(b) In adopting or approving any training program under this part, and as a condition to the expenditure of funds for any such program, the Secretary shall make such arrangements as he deems necessary to insure adherence to appropriate training standards, including assurances—

(1) that the training content of the program is adequate, involves reasonable progression, and will result in the qualification of trainees for suitable employment;

(2) that the training period is reasonable and consistent with periods customarily required for comparable training;

(3) that adequate and safe facilities, and adequate personnel and records of attendance and progress are provided; and

(4) that the trainees are compensated by the employer at such rates, including periodic increases, as may be deemed reasonable under regulations hereinafter authorized, considering such factors as industry, geographical region, and trainee proficiency.

(c) Where on-the-job training programs under this part require supplementary classroom instruction, appropriate arrangements for such instruction shall be agreed to by the Secretary of Health, Education, and Welfare and the Secretary of Labor.

Advisory Committees

SEC. 205. (a) The Secretary shall appoint a National Advisory Committee which shall consist of ten members and shall be composed of representatives of labor, management, agriculture, education, and training, and the public in general. From the members appointed to such Committee the Secretary shall designate a Chairman. Such Committee, or any duly established subcommittee thereof, shall from time to time make recommendations to the Secretary relative to the carrying out of his duties under this Act. Such Committee shall hold not less than two meetings during each calendar year.

(b) For the purpose of making expert assistance available to persons formulating and carrying on programs under this title, the Secretary shall, where appropriate, require the organization on a community, State and/or regional basis of labor-management-public advisory committees.

(c) The National Advisory Committee may accept gifts or bequests, either for carrying out specific programs or for its general activities or for its responsibilities under subsection (b) of this section.

(d) Appointed members of the National Advisory Committee shall be paid compensation at the rate of $50 per diem when engaged in the work of the National Advisory Committee, including travel time, and shall be allowed travel expenses and per diem in lieu of subsistence as authorized by law (5 U.S.C. 73b-2) for persons in the Government service employed intermittently and receiving compensation on a per diem, when actually employed, basis.

(e)(1) Any member of the National Advisory Committee is hereby exempted, with respect to such appointment, from the operation of sections 281, 283, and 1914 of title 18 of the United States Code, and section 190 of the Revised Statutes (5 U.S.C. 99), except as otherwise specified in paragraph (2) of this subsection.

(2) The exemption granted by paragraph (1) of this subsection shall not extend—

(A) to the receipt or payment of salary in connection with the appointee's Government service from any source other than the private employer of the appointee at the time of his appointment, or

(B) during the period of such appointment, to the prosecution or participa-

tion in the prosecution, by any person so appointed, of any claim against the Government involving any matter with which such person, during such period, is or was directly connected by reason of such appointment.

State Agreements

SEC. 206. (a) The Secretary of Labor is authorized to enter into an agreement with each State, or with the appropriate agency of each State, pursuant to which the Secretary of Labor may, for the purpose of carrying out his functions and duties under this title, utilize the services of the appropriate State agency and, notwithstanding any other provision of law, may make payments to such State or appropriate agency for expenses incurred for such purposes.

(b) Any agreement under this section may contain such provisions as will promote effective administration, protect the United States against loss and insure that the functions and duties to be carried out by the appropriate State agency are performed in a manner satisfactory to the Secretary.

Rules and Regulations

SEC. 207. The Secretary of Labor shall prescribe such rules and regulations as he may deem necessary and appropriate to carry out the provisions of this part.

Labor Mobility Demonstration Projects

SEC. 208. During the period ending June 30, 1965, the Secretary of Labor shall develop and carry out, in a limited number of geographical areas, pilot projects designed to assess or demonstrate the effectiveness in reducing unemployment of programs to increase the mobility of unemployed workers by providing assistance to meet their relocation expenses. In carrying out such projects the Secretary may provide such assistance, in the form of grants or loans, or both, only to involuntary unemployed individuals who cannot reasonably be expected to secure full-time employment in the community in which they reside, have bona fide offers of employment (other than temporary or seasonal employment), and are deemed qualified to perform the work for which they are being employed. Where such assistance is provided in the form of grants, such grants may not exceed 50 per centum of the expenses incurred reasonably necessary to the transportation of the person who is relocating, and his family, and their household effects. Where such assistance is provided in the form of loans, or a combination of loans and grants, the total amount thereof may not exceed 100 per centum of such expenses and shall be made subject to such terms and conditions as the Secretary may prescribe. Of the funds appropriated for a fiscal year to carry out this title, not more than 2 per centum thereof, or $4,000,000, whichever is the lesser, may be used for the purposes of this section.

PART B—DUTIES OF THE SECRETARY OF HEALTH, EDUCATION, AND WELFARE

General Responsibility

SEC. 231. The Secretary of Health, Education, and Welfare shall, pursuant to the provisions of this title enter into agreements with States under which the appropriate State vocational education agencies will undertake to provide training needed to equip persons referred to the Secretary of Health, Education, and Welfare by the Secretary of Labor pursuant to section 202, for the occupations specified in the referrals, except that with respect to education to be provided pursuant to referrals under subsection (b) or (i) of section 202, the Secretary of Health, Education, and Welfare may make arrangements for the provision of the education to be provided under such subsection through other appropriate education agencies. Such State agencies shall provide for such training through public education agencies or institutions or through arrangements with private educational or training institutions where such institutions can provide substantially equivalent training with reduced Federal expenditures. The State agency shall be paid 50 per centum of the cost to the State of carrying out the agreement, except that for the period ending June 30, 1965, the State agency shall be paid 100 per centum of the cost to the State of carrying out the agreement with respect to unemployed persons, and for the fiscal year ending June 30, 1966, the State agency shall be paid 66⅔ per centum of such cost. Such agreements shall contain such other provisions as will promote effective administration (including provision (1) for reports on the attendance and performance of trainees, (2) for immediate certification to the Secretary of Labor by the responsible training agency with respect to each person referred for training who does not have a satisfactory attendance record or is not making satisfactory progress in such training absent good cause, and (3) for continuous supervision of the training programs conducted under the agreement to insure the quality and adequacy of the training provided), protect the United States against loss,

and assure that the functions and duties to be carried out by such State agency are performed in such fashion as will carry out the purposes of this title. In the case of any State which does not enter into an agreement under this section, and in the case of any training which the State agency does not provide under such an agreement, the Secretary of Health, Education, and Welfare may provide the needed training by agreement or contract with public or private educational or training institutions.

Rules and Regulations

SEC. 232. The Secretary of Health, Education, and Welfare may prescribe such rules and regulations as he may deem necessary and appropriate to carry out the provisions of this part.

TITLE III—MISCELLANEOUS

Apportionment of Benefits

SEC. 301. For the purpose of effecting an equitable apportionment of Federal expenditures among the States in carrying out the programs authorized under title II of this Act, the Secretary of Labor and the Secretary of Health, Education, and Welfare shall make such apportionment in accordance with uniform standards and in arriving at such standards shall consider only the following factors: (1) the proportion which the labor force of a State bears to the total labor force of the United States, (2) the proportion which the unemployed in a State during the preceding calendar year bears to the total number of unemployed in the United States in the preceding calendar year, (3) the lack of appropriate full-time employment in the State, (4) the proportion which the insured unemployed within a State bears to the total number of insured employed within such State, and (5) the average weekly unemployment compensation benefits paid by the State. The Secretary of Labor and the Secretary of Health, Education, and Welfare are authorized to make reapportionments from time to time where the total amounts apportioned under this section have not been fully obligated in a particular State, or where the State or appropriate agencies in the State have not entered into the necessary agreements, and the Secretaries find that any other State is in need of additional funds to carry out the programs authorized by this Act.

Maintenance of State Effort

SEC. 302. No training program which is financed in whole or in part by the Federal Government under this Act shall be approved unless the Secretary of Labor, if the program is authorized under Part A of title II, or the Secretary of Health, Education, and Welfare, if the program is authorized under part B of title II, satisfies himself that neither the State nor the locality in which the training is carried out has reduced or is reducing its own level of expenditures for vocational education and training, including program operation under provisions of the Smith-Hughes Vocational Education Act and titles I, II, and III of the Vocational Education Act of 1946, except for reductions unrelated to the provisions or purposes of this Act.

Other Agencies and Departments

SEC. 303. (a) In the performance of their function under this Act, the Secretary of Labor and the Secretary of Health, Education, and Welfare, in order to avoid unnecessary expense and duplication of functions among Government agencies, shall use the available services or facilities of other agencies and instrumentalities of the Federal Government, under conditions specified in section 306(a). Each department, agency, or establishment of the United States is authorized and directed to cooperate with the Secretary of Labor and the Secretary of Health, Education, and Welfare and, to the extent permitted by law, to provide such services and facilities as either may request for his assistance in the performance of his functions under this Act.

(b) The Secretary of Labor and the Secretary of Health, Education, and Welfare shall carry out their responsibilities under this Act through the maximum utilization of all possible resources for skill development available in industry, labor, public and private educational and training institutions, State, Federal, and local agencies, and other appropriate public and private organizations and facilities.

Appropriations Authorized

SEC. 304. (a) There are hereby authorized to be appropriated $2,000,000 for the fiscal year ending June 30, 1963, $3,000,000 for the fiscal year ending June 30, 1964, and each of the two succeeding fiscal years, for the purpose of carrying out title I.

(b) There are hereby authorized to be appropriated $97,000,000 for the fiscal year ending June 30, 1963, $161,000,000 for the fiscal year ending June 30, 1964, $407,000,000 for the fiscal year ending June 30, 1965, and $281,000,000 for the fiscal year ending June 30, 1966, for the purpose of carrying out title II.

(c) There are hereby authorized to be appropriated $1,000,000 for the fiscal year ending June 30, 1963, $1,000,000 for the fiscal year ending June 30, 1964, and each of the two succeeding fiscal years, for the purpose of carrying out title III.

(d) There are hereby authorized to be appropriated $5,000,000 for the fiscal year ending June 30, 1962, for planning and starting programs under this Act.

Limitations on Use of Appropriated Funds

SEC. 305. (a) Funds appropriated under the authorization of this Act may be transferred, with the approval of the Director of the Bureau of the Budget, between departments and agencies of the Government, if such funds are used for the purposes for which they are specifically authorized and appropriated.

(b) Any equipment and teaching aids purchased by a State or local education agency with funds appropriated to carry out the provisions of part B shall become the property of the State.

(c) No portion of the funds to be used under part B of this Act shall be appropriated directly or indirectly to the purchase, erection, or repair of any building except for minor remodeling of a public building necessary to make it suitable for use in training under part B.

(d) Funds appropriated under this Act shall remain available for one fiscal year beyond that in which appropriated.

Authority to Contract

SEC. 306. (a) The Secretary of Labor and the Secretary of Health, Education, and Welfare may make such contracts or agreements, establish such procedures, and make such payments, either in advance or by way of reimbursement, or otherwise allocate or expend funds made available under this Act, as they deem necessary to carry out the provisions of this Act.

(b) The Secretary of Labor and the Secretary of Health, Education, and Welfare shall not use any authority conferred by this Act to assist in relocating establishments from one area to another. Such limitation shall not prohibit assistance to a business entity in the establishment of a new branch, affiliate, or subsidiary of such entity if the Secretary of Labor finds that assistance will not result in an increase in unemployment in the area of original location or in any other area where such entity conducts business operations, unless he has reason to believe that such branch, affiliate, or subsidiary is being established with the intention of closing down the operations of the existing business entity in the area of its original location or in any other area where it conducts such operations.

Selection and Referral

SEC. 307. The selection of persons for training under this Act and for placement of such persons shall not be contingent upon such person's membership or nonmembership in a labor organization.

Definition

SEC. 308. For the purposes of this Act, the term "State" includes the District of Columbia, Puerto Rico, the Virgin Islands, and Guam.

Secretaries' Reports

SEC. 309. (a) Prior to March 1, 1963, and again prior to April 1, 1964, April 1, 1965, and April 1, 1966, the Secretary of Labor shall make a report to Congress. Such report shall contain an evaluation of the programs under title I and part A of title II, including the number of persons trained and the number and types of training activities under this Act, the number of unemployed or underemployed persons who have secured full-time employment as a result of such training, and the nature of such employment, the need for continuing such programs, and recommendations for improvement.

(b) Prior to March 1, 1963, and again prior to April 1, 1964, April 1, 1965, and April 1, 1966, the Secretary of Health, Education, and Welfare shall also make a report to Congress. Such report shall contain an evaluation of the programs under part B of title II, the need for continuing such programs, and recommendations for improvement. The first such report shall also contain the results of the vocational training survey which is presently being conducted under the supervision of the Secretary.

Termination of Authority

SEC. 310. (a) All authority conferred under title II of this Act shall terminate at the close of June 30, 1966.

(b) Notwithstanding the foregoing, the termination of title II shall not affect the disbursement of funds under, or the carrying out of, any contract, commitment or other obligation entered into prior to the date of such termination: *Provided*, That no disbursement of funds shall be made pursuant to the authority conferred under title II of this Act after December 30, 1966.

A conference was attended by 109 persons representing supervision and teacher education in 13 states, the American Vocational Association, and the U.S. Office of Education. Graduate students from three states, and representatives of industry from seven states were guests. Minutes of the business session and of seven conference sessions are included. Brief excerpts are given from talks by Mary Allen, Duane Nielsen, A. W. Tenney, Carsie Hammonds, and Lane Ash. Brief reports are given for presentations by participating conferees on a wide range of topics relative to research, program development, teacher education, and supervision. (JM)

****

Preface

The Proceedings of the 43rd Annual North Atlantic Regional Conference of Supervisors, Teacher Trainers and Directors of Agricultural Education was assembled and mimeographed under the direction of Dr. Bruce Gaylord, Head, Department of Agricultural Education, University of Vermont, Burlington, Vermont, who served as General Secretary of the Conference. It includes a record of conference sessions, addresses not distributed by the speakers but made available to the session secretary, committee reports, and other matters taken up by the group.

Since the content of this publication includes chiefly the expression of opinions by the participants as summarized and recorded by session secretaries, it is not to be taken as official pronouncements of the U. S. Office of Education. Grateful appreciation, however, is extended to Miss Edith Williams of the Division of Vocational and Technical Education of the Office of Education for her editorial assistance.

ROSTER OF CONFERENCE GUESTS

Name	Address	Title and/or Organization
T. L. Ayers	Washington, D. C.	Asst. Adm. ACP-Dept. of Ag.
Mrs. Mary Ahalt	College Park Md.	
Joe Dan Boyd	Philadelphia, Pa.	Farm Journal
Leland Bradley	Lafayette, Ind.	American Zinc Institute
Willard Cheek	Detroit, Mich.	Speaker, G. M. Corp.
Gene Brown	Chicago, Ill.	National Safety Council
Louis S. Brubaker	Akron, Ohio	B. F. Goodrich Co.
Merle Douglas	Philadelphia, Pa.	Sears-Roebuck Foundation
John Daneke	Detroit, Mich.	Retired G. M. Official
Raymond O. Darling	Detroit, Mich.	General Motors Corp.
George Derr	Harrisburg, Pa.	MDTA - Department of Education
James L. Givens	Winchester, Va.	NVATA - Vice President
Russell L. Guin	Danville, Ill.	Interstate Publishers
George Webster	Philadelphia, Pa.	WFIL - TV

Graduate Students Attending:

Cornell University: L. W. Becket, James Hannemann, J. Alex Hash, Frank Pearce, Charles Rogers, Muhsin Al-Solman and Raymond Bwadley

Pennsylvania State University: Charles Huffman, Williams L. Hull, Lamar Land, Joseph Moore and Russell Weller

University of Maryland: Ernest Cullen and Takumi Kono

Business Session

Monday Evening, April 1, 1963

Chairman: Norman K. Hoover Secretary: Ralph Barwick

The business session was called to order by the Chairman at 7:30 p.m.

The invocation was given by Daniel Koble.

Dr. M. D. Mobley, Executive Secretary, AVA spoke on the "Outlook for Vocational Education."

R. C. S. Sutliff, National AVA Vice-President for Agriculture, reviewed the organizational structure of AVA. He appointed a committee to meet with Dr. A. W. Tenney to review a brochure entitled "Agriculture is More Than Farming," that is being prepared to present the true facts concerning agriculture. Members of the committee are Wenroy Smith, Cola Watson, Homer Edwards, Joe Bail and Ray Cardozier.

Wenroy Smith, NVATA President, addressed the Conference and commented upon the excellent relationship between supervisors, teacher trainers and teachers.

Julian Carter, Chairman of the Agricultural Division, AVA Membership Committee, distributed and discussed AVA membership materials.

Dave McClay stressed the importance of AVA membership and urged activation of State Membership Committees.

Committee Reports

Representatives of the following National Committees reported on their respective meetings in Milwaukee, Wisconsin, in December, 1962:

1. Research - Glenn Z. Stevens
2. Standards and Policies - Jesse A. Taft (Recommendation combined with the Regional Conference reports to be presented on Thursday)
3. Teacher Education - Robert C. Jones (Recommendation combined with reports to be presented on Thursday)
4. Professional Information - Everett C. Lattimer (Reports distributed)
5. Professional Relations - Neal Andrew (Reports distributed)

Other Reports

Other reports which were presented are as follows:

1. Managing Board of the Agricultural Education Magazine - Cola D. Watson (See Supplement B)

   The suggestion that the name "The Agricultural Education Magazine" be change to "Journal of Agricultural Education, was tabled until a later date.

2. Editorial Staff of the Agricultural Education Magazine - Gene M. Love (See Supplement C)

Chairman Hoover appointed Wallace Elliott, chairman of the next year's Program Committee, to serve as chairman of the Nominating Committee.

Koble

SUPPLEMENT A

Research Committee

Dr. George O'Kelley, Jr., Chairman, presided at the meeting in Milwaukee in December, 1962.

The major item considered was publication of the National Young Farmer Study. Dr. Aga presented a first draft of several sections of the data. Dr. Blake reported progress on other parts of the proposed report. Dr. Murray Straus has prepared the section on his Rural Attitudes Profile. Dr. Nielsen explained that the Office of Education has scheduled the publication of the study. A separate State report has been completed in Michigan, and others for Illinois and Pennsylvania will be issued.

Dr. Nielsen reported that the First National Seminar on Research in Vocational Education will be held at Purdue University in February. Dr. Stevens made a progress report of experimental studies in Tennessee, Oklahoma, Indiana and Pennsylvania. Proposals have been written for studies in Illinois, Michigan and Wisconsin.

Abstracts for the Summaries of Studies, Supplement 16, had been received by the chairman. Printing of Supplement 15 was considerably delayed last year.

Reports of Regional Research Conferences on university campuses in the North Atlantic, Southern and Central Regions indicated that increasing attention is being given to research designs. More supervisors are attending and sharing in research projects in their States.

SUPPLEMENT B

Managing Board - Agricultural Education Magazine

The following points were discussed by C. D. Watson, Member of the Board:

1. There was only a 2% loss of subscribers as a result of subscription rate increase.

2. The Magazine is now mailed out one week earlier.

3. Several changes have been made in Magazine format and content

4. Special efforts are being made to establish better communications among the Special Editors, the Editing - Managing Board, the Editor and the Business Manager on the status of subscriptions and improvement plans.

5. There is a possibility of increasing the size of the Magazine from 24 to 32 pages.

6. Nearly one-third of the articles submitted are now published.

7. The proposal to change the name of the Magazine to the "Journal of Agricultural Education," will be considered at the AVA Convention in December, 1963.

8. Every professional person in agricultural education is invited to submit articles to the Magazine.

SUPPLEMENT C

A summary of the articles by States published in the Agricultural Education in 1962 and those submitted for 1963 are as follows:

MAGAZINE ARTICLES						
STATE	Vo-Ag Teachers	Teacher Education	Super.	Others	1963 Total	1963 (Total Only)

W. Va.						3
Total	7	7	0	1	17	23

Tuesday Morning Session, April 2, 1963

Chairman: Bruce Gaylord Secretary: Guy E. Gain

The 43rd Annual Conference was called to order at 8:30 a. m.

The invocation was given by Gene Love.

L. L. Turner of Connecticut requested that everyone stand for a moment of silent prayer in memory of Mr. and Mrs. Ray Hahn, who passed away on December 21 and January 7 respectively. Mr. Hahn was a teacher and State Supervisor in Connecticut from 1922 to 1954.

Mr. H. N. Hunsicker, General Chairman, presented plans for the Conference and anticipated outcomes. He stressed that the work groups were an important feature of the Conference. If and when the present laws are changed or new legislation enacted, we must have programs ready for high school youth, post high school youth, and also for young and adult farmers. The work groups should identify such programs and suggest procedures for developing them.

Symposium: "Recommendations of the Panel of Consultants on Vocational Education"

Participating members were:

Miss Mary Allen, Assistant Director, Panel of Consultant, Office of Education, Washington, D. C.

Dr. Duane Nielsen, Program Specialist, Teacher Training Research, Agricultural Education, Washington, D. C.

Dr. A. W. Tenney, Director, Agricultural Education Branch, gave a talk entitled "Implications of the Panel's Recommendations for Agricultural Education." (See Supplement C) Dr. Tenney also emphasized the need for evaluating current programs and for conducting studies to determine future needs.

****

Mr. R. C. S. Sutliff of New York reported on progress New York State had made in conducting a study of occupational training needs in agriculture. He told of their plans for determining the need for area vocational schools and in meeting the needs for offering training in off-farm occupations.

Mr. Louis A. Brubaker, represented Mr. J. Ward Keener, Chairman of the National FFA Foundation Sponsoring Committee. Mr. Brubaker gave a brief report of the Foundation's activities for the current year.

H. E. Edwards of West Virginia explained the plan for organizing the work groups for "Developing the Agenda for Action" regarding future programs in agricultural education Those present were divided into the following groups:

Group A - Developing Instructional Programs in Agriculture for high school youth

Group B - Developing Instructional Programs for post high school youth

Group C - Developing Instructional Programs for adults (Includes Young Farmers)

The groups met from 11:00 a.m. to 12:15 p.m. and also again on Thursday afternoon.

Forms for use in evaluating the Conference were distributed and Conference members were requested to fill them out and to return them Friday morning.

SUPPLEMENT A

Excerpts from Talk by Miss Mary Allen

The Panel is of considerable historical significance. Not since the Commission of 1914 has a president of the United States asked for a study of this kind. Congress has made studies - and other groups have made studies and recommendations - and one President even recommended that the financial responsibility for vocational education be returned entirely to the States. However, I think it is fair to say that the Panel of Consultants had a point of departure which differed somewhat from that of other studies and commissions - that point being contained in the message of the President himself. This message to Congress in 1961, in which the President requested the appointment of an advisory group on vocational education, was in itself something of an evaluation of vocational education. The President said:

> "The basic purpose of our vocational education effort is sound and sufficiently broad to provide a basis for meeting future needs. However, the technological changes which have occurred in all occupations call for a review and re-evaluation of these Acts, with a view toward their modernization."

The Panel approached its study by concerning itself with the social, economic and technological changes that are taking place in our world.

The Panel involved the time and effort of three full-time professional staff members; it cost the taxpayer $200,000; consumed the time and energy of 25 Panel members; it absorbed considerable time and effort of the people in the Division of Vocational and Technical Education of the USOE, and I know that countless hundreds of individual vocational educators made contributions to our work. For all these reasons, It is my hope that each of you, and I am sure you do, feel a professional responsibility to take a look at the report and evaluate it carefully in terms of your own activities and responsibilities.

The Panel report is organized into these parts: Review, Evaluation, Improvement and Redirection.

As you can well imagine, our work was not simple. While there is an abundance of information on some aspects of vocational education, it was extremely difficult to organize this material in such a way as to get a complete review and evaluation of vocational education. The study was limited in scope to the public school vocational education programs and the Federal role in vocational education. The panel also focused its attention primarily on the decade of the 1960's.

In attempting to assess the environment in which vocational education will take place in the 1960's, the Panel considered these factors to be of great significance:

1. The population explosion - the greatly increasing number of people in this country

2. The mobility of population - every year nearly one American in five changes his residential address. One in four now live in a State other than the one in which he was born. Two major trends in population mobility were noted: A westward movement - and movement to the States bordering the Pacific and Atlantic Oceans - the Gulf of Mexico and the Great Lakes.

3. A movement to the metropolitan areas - The Panel was also concerned about the economic aspects of vocational education. The Report pointed out that our Nation, along with 19 other nations, has joined the Organization for Economic Cooperation and Development - the OECD. These nations have, in substance, pledged themselves to attain a 50% increase in combined national output during the decade of the 1960's - this means that America must have an average annual growth rate of 4.1%. The Panel study attempts to relate education, and more specifically vocational education, in a positive way to economic growth.

Returning now to the organization of the Panel Study. Some "simple truths" that we can all glean from the study about vocational education:

1. Vocational education and training are sound investments in people. People who have vocational skills are more employable than those who do not have them. Vocational graduates have an increased earning capacity. Vocational education graduates do, in fact, work in the fields related to their training.

2. The local-State-Federal partnerships in vocational education teaches the skills that the Nation needs. Vocational education does make a significant contribution to the National welfare.

This, may sound simple to you - but may I suggest that this is <u>OUR</u> story - and it is one that we must begin to tell. I suggest to you, too, that there is not in all the world, a more thrilling or eloquent story. It says that education is good for people and because it has been good for them, America has achieved its present eminence in the world - and it says, too, that America's future will continue to depend upon the character and competence of those who teach.

SUPPLEMENT B

Excerpts from Talk by Dr. Duane Nielsen

The Panel Report states:

By 1970, 87,000,000 people will be working full time.

Schools must help. Of every ten youngsters now in grade school only two will finish four years of college.

During 1960-70, the most rapidly expanding occupations will require training.

Education and training are sound investments in people.

The local, State, Federal partnership teaches skills people need. Vocational Education is not available in enough schools.

Vocational education is not available to all who need it.

Vocational education is not preparing for enough jobs.

Technical training after high school is a critical need.

It is proposed that the Federal Government should provide at least four hundred million dollars in 1963-64 to train the necessary people for the labor force.

SUPPLEMENT C

Implementing Programs in Agricultural Education - Dr. A. W. Tenney

Current Programs:

Determine Needs - Find out what has been done in the various States to meet them.

Expand as Needed - Develop a program to meet these needs.

Improve Quality - Improve the quality of existing programs.

Evaluate - Continue to evaluate the progress made and make plans for improvement.

Broaden Programs - Management must be emphasized. The phase of farm management including finance must be broadened. Farm mechanization must be emphasized. Automation is moving in on the farm. Training in forestry, conservation, horticulture and recreation must be emphasized.

Off-Farm Agricultural Occupations - Lack of information about them is our greatest limitation.

Conduct Studies - Not prepared now to more into this field. States must make some studies before moving into this field at the National level.

Cluster Jobs - Need to pull together certain jobs into clusters.

Write Job Description - Need to know what job involves, what it pays and its demands.

Outline Courses -

Prepare Teaching Aids - Enlarged staff on both National and State level will be needed.

Develop Pilot Programs - Need to go through foregoing steps before setting up pilot programs.

Determine Teacher Qualifications -

Plan Facilities -

Plan Administration - Should be under Agricultural Education Branch so it can be coordinated closely with Vocational Agriculture Program.

Decide Where to Offer -

Plan Teacher Education - What type of teacher education program will be needed?

Cooperation - Cooperation needed between various fields of vocational education.

Conferences - Plan to call meetings on national basis of head teacher trainers and State Supervisors.

Tuesday Afternoon, April 2, 1963

The five standing committees met separately and worked on selected projects. The reports of these committees are as follows:

Standards and Policies Committee - Chairman: Jesse A. Taft

Vice Chairman: J. C. Fink Secretary: Ben K. Bristol

1. Dr. Tenney reported that Monograph #21 would be revised and published as soon as legislation is passed. He is entertaining suggested changes.

2. C. D. Watson presented, "Criteria for Self-Evaluation of State Programs of Supervision in Agricultural Education - North Atlantic Region." It was agreed to give it a one-year trial in the Region.

3. H. Edwards reported on the trial of "Local Policy Statements for Vocational Agriculture," and the Committee strongly recommended all States in the Region make full use of the booklet.

4. B. K. Bristol reported on the special meeting of the Farm Mechanics Committee. It was agreed by the Standards and Policy Committee to include the Farm Mechanics Committee as a sub-committee. It was also moved to recommend to AVA that a similar structure be adopted at the national level. (See Supplement A)

5. J. A. Taft agreed to submit copies of "Guiding Principles in Developing Farm Experience Centers" to all Committee members for comments, to be reported at the next Regional Conference.

6. The sub-committee on "Revising Supervisory Guide" was discharged.

7. Voted to recommend to the National Standards and Policy Committee that contact be made with the officials of the association in charge of secondary school evaluations offering consulting services on the section of this evaluative criteria pertaining to vocational agriculture programs.

8. Moved that a list of approved MDTA projects be sent to head teacher educators and supervisors monthly by the U. S. Office of Education.

9. H. E. Edwards reported on "A Safety Check-list for Vocational Agriculture." Voted by Committee to establish a sub-committee within the Regional Standards and Policies Committee entitled "Safety Education in Vocational Agriculture" to be chaired by Edwards.

10. R. C. S. Sutliff was appointed to serve on the Planning Sub-Committee for the North Atlantic Regional Research Conference.

11. Committee went on record as being highly in favor of the National Center for Advanced Study at Ohio State University and pledged its continued support and cooperation.

Committee members:

H. E. Edwards, C. D. Watson, E. F. Nohle, W. H. Evans, R. C. S. Sutliff, A. H. Hollenberg, J. A. Taft, J. C. Fink, Ben K. Bristol and Harry McDonald

SUPPLEMENT A

Farm Mechanics Sub-Committee

Chairman: B. K. Bristol Secretary: Guy E. Cain

1. Nohle distributed Farm Mechanics material developed in New York, and McGarr did so for Massachusetts. McGhee distributed source units prepared in West Virginia.

2. Annis of New Hampshire reported on Farm Mechanics contest features in Massachusetts and New Hampshire and distributed University of New Hampshire and USDA Bulletins. Hollenberg and Bristol reported on Farm Mechanics bulletins and also on Farm Mechanics studies which are being conducted.

3. Lechner of New York proposed that each State check with its Agricultural Engineeri Department and determine trends in each of the areas of Farm Mechanics that related to farmers. Those responsible for obtaining this information in the respective States are:

W. Va.	- Claude McGhee	Maine	- Wallace Elliott
Pa.	- B. K. Bristol	Vt.	- Bruce A. Gaylord
N. H.	- William Annis	R. I.	- Raymond Northup
N. Y.	- Fred Lechner	N. J.	- William Evans
Mass.	- Tom McGarr	Conn.	- Howard Martin
Dela.	- W. R. Wynder	Md.	- Clodus Smith

4. Annis was elected chairman, and Guy Cain was elected secretary of the Regional Farm Mechanics Committee.

5. Bill Annis moved that each member of the Farm Mechanics Sub-Committee be sent a Copy of the minutes of this meeting. Seconded by McGhee. Passed.

6. Agreed that Mr. Hollenberg should continue his work on identifying Farm Mechanics needs which was started last year.

7. Pennsylvania and New Hampshire will cooperate during the coming year on the project, "On-Farm Service Centers in Mechanized Farming."

8. Fred Lechner agreed to send each member of the Farm Mechanics Committee a copy of a study in New York, "Economics of Owning Tools in a Farm Shop."

9. Robert C. Jones of Massachusetts was requested to furnish each member of the Farm Mechanics Committee a copy of work he has underway.

10. The Chairman was requested to send a reminder to all members of the Committee in January to bring any materials available from their State for exchange between members of the Committee. Also ideas that are or have been used.

11. Other members of the Committee not listed under item three are: James C. Finck, Ernest Nohle and Guy Cain.

<u>Professional Information Committee</u> - Chairman: Everett Lattimer

Vice Chairman: Norman Hoover Secretary: George Lange

1. Lattimer reported on "A Descriptive and Source Listing of Professional Information in Agricultural Education." The Committee recommended the continuation of this service.

2. A Pennsylvania study by Robert Walker was reported by its author relative to vocational agriculture interest inventory which was validated and appeared to have considerable potential for use by guidance personnel.

3. Martin of Connecticut reported on "Supervised Work Experience Records in Vocation Agriculture," and indicated the availability of the record book. Price 14¢ per copy from French Bray Publishing Company.

4. William Annis was elected to the Planning Committee for Regional Research Conference for 1963.

5. Dr. Tenney commended the group for the publication on Supervised Work Experience by Martin and pointed out its potential use in keeping records of experience in Agricultural Related Occupation.

6. A discussion was held on identifying employment opportunities and competencies for off-farm agricultural occupations. A Committee composed of Bail and Hoover was elected to collect Regional data on this topic for national statistical use.

7. Annis, McGarr and Thomas were elected to a Committee to prepare news releases on vocational agriculture relative to "What It is - Where It Leads."

<u>Committee members</u>:

Everett Lattimer, George Lange, Norman Hoover, Joe Bail, W. R. Wynder, Joe Bailey, W. H. Annis, Fred Lechner, Tom McGarr, Carl Thomas, Steve Smith and Charles Shoup

Teacher Education Committee - Chairman: R. C. Jones

Vice Chairman: Bruch Gaylord Secretary: Warren Kelly

1. Kelly of West Virginia reported on "Trends in Developing Courses of Study," and his sub-committee was instructed to continue working on an acceptable "Guide" to be used by States. It was the intent that "The Guide" be developed so as to include any new features which may arise with the passage of new legislation.

2. Cushman reported on methods tried in New York to determine the effectiveness of recruiting procedures for potential agricultural education majors in teacher education.

3. McClay was named chairman of a sub-committee to work on "Development of Teacher Education Programs for the Future."

4. Committee officers elected for a three-year period included: Gaylord, Chairman; Kelly, Vice Chairman; and Cardozier, Secretary.

5. Gaylord was elected as a representative on the Program Planning Committee of the Regional Research Conference.

6. Cushman reported on the publication "Experiences for Student Teachers in Agriculture Education." He reported that Interstate would publish it for 25 cents a copy. Cushman was commissioned to request a supply to be printed as soon as possible.

Committee members:

Robert Jones, Bruce Gaylord, Warren Kelly, Raymond Northup, Wallace Elliott, Frank Anthony, Paul Gilman, W. H. Wayman, Julian Carter, Ray Cardozier and David McClay.

Professional Relations Committee - Chairman: Neal Andrew

Vice Chairman: William Drake Secretary: R. C. Butler

1. Butler of West Virginia reported on the status of a study entitled, "What Materials are Available in the Occupations File for High School Students Pertaining to Careers in Agriculture, Agricultural Education and Vocational Agriculture." - This project to be continued.

2. Cain reported on, "The Role of Vocational Agriculture in the Suburban High School." - This project to be continued.

3. Turner of Connecticut suggested a study on, "Determining the Specific Kinds of Training and Experiences Needed for Success in Selected Agricultural Occupations.'

4. Andrew of New Hampshire reported on work on the project, "What Practices and Procedures are Best in Presenting Guidance Personnel with Career Information Dealing with Agriculture, Agricultural Education and Vocational Agriculture."

5. A new study entitled, "The Role of Vocational Agriculture in Area Redevelopment" was undertaken, but it was agreed that it should be entended to include RAD as well.

6. The following members were elected for three-year terms on the Committee: William Drake, Chairman; R. C. Butler, Vice Chairman; D. E. Koble, Secretary; and Willaim Drake, Regional Research Committee Representative.

7. William Drake will be in charge of developing sample stories for news releases about vocational agriculture and will report at the 1964 Conference.

Committee members:

Neal Andrew, R. C. Butler, William Drake, J. O. Sanders, Daniel Koble, Guy Cain, L. L. Turner, Archie Holdridge, Claude Marion and Ernest Cullen

Research Committee - Chairman: Glenn Z. Stevens

Vice Chairman: Fred Tom Secretary: Gene Love

Dr. David R. McClay presented a brief report on the Objectives Committee, which had been appointed by the Conference to review and revise the objectives for vocational education in agriculture. He reported that the list of new objectives suggested and presented at the 1962 Conference had been further revised at the North Atlantic Regional Research Conference in Amherst, Massachusetts, and by the agricultural education supervisors, teacher trainers and teachers in Pennsylvania during the preceeding year.

Mr. Claude McGhee presented a summary of research completed in the State of West Virginia since the last Conference. He distributed copies of abstracts of three studies and briefly discussed two others.

Mr. Russell Weller reported progress on a Penn State Staff Study dealing with an experimental study titled "Efficiency and Educational Effectiveness of Three Patterns of Scheduling and of Supervision and Instruction in a Quality Milk Production Course for Teachers."

Mr. David F. Shontz also reported progress on another teaching experiment which was conducted as the Pennsylvania State University and which deals with agricultural occupations information.

Dr. Duane Nielsen reported on present and proposed State studies of off-farm agricultural occupations. Progress is being made in eight States with sampling surveys directed at administrative problems dealing with training for off-farm agricultural occupations.

Dr. Nielsen directed a discussion of the research techniques employed in the surveys cited above and mentioned efforts he has made during the past year to coordinate these research efforts among conferences and among States. He announced a three-day meeting of State Project Leaders to be held at the National Study Center at Ohio State University, May 27-29.

Dr. Robert Walker reported development of the Pennsylvania Vocational Agriculture Interest Inventory.

Ernest Nohle nominated Dr. Harold Noakes, Supervisor from New York State to fill the unexpired term of Vice Chairman, Fred K. Tom, Teacher Education, Cornell University, who is presently on leave.

Committee members:

Glenn Stevens, Fred Tom, Gene Love, Howard Martin, C. W. Hill, Clodus Smith, Harold Noakes, Claude McGhee, Ralph Barwick and Harold Cushman

Wednesday Morning, April 3, 1963

Chairman: James C. Fink Secretary: Clodus Smith

The session was called to order at 8:30. Dr. R. C. Butler gave the invocation.

Robert C. Jones gave the report for the Teacher Education Committee. (See page 10)

Noteworthy Developments in the High School Program

1. West Virginia - Forestry Centered Programs - R. C. Butler
Warren Kelly

The vo-ag program at the Parsons High School was expanded this year to a two teacher department with one teacher devoting full time to the area of forestry. The school is located near the Monongahela National Forest and there are also many privately owned wooded areas and sawmills in the county. The teacher is a college graduate and experienced forester but lacks training in agricultural education. He plan to enroll in off-campus courses in professional agricultural education and eventually to qualify as a vocational instructor. The Parsons program is considered a pilot center. Students who have interests and objectives in forestry are enrolled. There are two classes each of which meets for three consecutive hour periods per day. The forestry program is two years in length and is limited chiefly to junior and senior students. Three, one-hour class periods are needed to allow for both theory and practice in forestry and agricultural mechanics. Students also are required to carry a full load of academic courses which will qualify them for high school graduation and some

The principal and superintendent have shared in all decisions in connection with the forestry course, and they are greatly interested in it.

****

2. Pennsylvania - Agri-Business Centered Programs - Thomas Wayant

Mr. Wayant reported that the ever increasing complexity of the agricultural industry has created a demand for better trained personnel in all its facets. Positions in allied fields of marketing and distribution especially need personnel with agricultural background as well as with instruction for specific jobs.

An editorial in the January, 1962 issue of the Farm Bureau Mirror helps to substantiate this claim when it states: "Selling for and to farmers is a field that has been sadly neglected, particularly from the angle of selecting salesmen with a farm background and then following through with proper agricultural training."

The same statement can be made about all other positions in marketing and distribution connected with agriculture.

Part of the reason for the lack of proper training has been the arbitrary divisions between vocational agriculture and distributive education programs. Vocational agriculture has been concentrated in schools serving rural youth while distributive education has been located almost exclusively in schools in or near large urban areas. The training of the teachers in each field has been separate and distinct.

The problem has been further heightened by the rather rapid increase in the mobility of rural youth resulting in a diversification of their occupational aspirations. With automobiles and good highways has come the "commuting farmer" who is able to drive long distances to work in larger urban centers. Types of work are now available to farm youth for which they receive little or no training in the typical rural high school.

Mechanization of farms now makes it possible for fewer persons to produce the same, and in many cases more, agricultural products. It becomes obvious that if schools are to help students discover the kind of work they want to do they must offer more occupational training opportunities to the rural youth. A pilot program was initiated in the Cumberland Valley with vocational agriculture and distributive education cooperating. The objectives of this program are:

A. To develop a cooperative vocational agriculture - distributive education program.
B. To provide opportunities for training in the field of marketing and distribution for rural youth.
C. To determine the amount and kinds of training needed for students and instructors to prepare them for positions in marketing and distribution.
D. To determine the feasibility of creating a State-wide program of distributive education in rural areas.
E. To test a cooperative vocational agriculture - distributive education program for use in are vocational schools.

****

3. New York - Programs in Urban Areas - George Ehrein

When I was preparing to teach vocational agriculture at Cornell, we used as our main text "Teaching Agricultural Vocations" by Stewart and Getman. In a chapter dealing with "Guiding Pupils in Curriculum Choices," the authors had this to say - some 36 years ago - "When the true interests of many farm boys are discovered, we find that they have ambitions for a professional career or a career in urban industry. Likewise, many city-bred boys find in a farming occupation opportunity for self-expression and the keen satisfaction which the farm boy may be inclined to seek elsewhere."

From the beginning it has been accepted that there are opportunities in the city for those born and schooled in the country. What is not readily recognized is that it is a two-way street. The son of a city dweller may and often does find usefulness and happiness in the country.

Many of these young people are in the city partly as a matter of chance. I am sure you will find in hundreds of cases - backgrounds, ties, and traditions are essentially rural. Some, for no demonstrable reason, long for a different environment. The urge is there just as it must always be in a free society.

Today, as all of us know, one does not have to own or acquire a farm to associate himself with agriculture.

Our Program

A. Approximately 100 students
B. 37 in senior class - we expect 75 - 80% of these young men to further their education in the two year technical institutes or four year colleges of agriculture. To date, this is a brief record of the present senior class - 37:

College	No. Accepted	Major Areas
Delhi AT1	3	2 - Animal Husbantry
		1 - Dairy Technology
Farmingdale AT9	9	4 - Food Processing
		2 - Ornamental Horticulture
		1 - Agr. Eng. Tech.

Many - at least ten - are still waiting to hear from the schools where they have applied. One has already applied for service in the Peace Corps.

****

4. New Jersey - Vocational Agriculture for the Handicapped - John E. Radramy

The New Jersey School for the Deaf is part of the public school system of New Jersey. It is maintained as a State school under the direction of the State Board of Education for boys and girls between the ages of 14 - 21 whose hearing is so impaired that satisfactory progress cannot be made in normal hearing school.

The vocational department offers 17 trades for boys and girls. Floriculture is available to both boys and girls. A complete program is offered in gardening, the propogation and growth of trees, shrubs and the growing of all types of flowers and plants. Training is provided in planting, spotting, watering, fertilization, cutting, floral arranging and greenhouse maintenance. The length of time needed to complete the course is at least three years and virtually 100 percent of the graduates are employed.

****

5. Maine - Consolidated (Area) Program - W. H. Elliott

This comprehensive area school is located in Sanford, Maine near the geographical center of York County. The community lies adjacent to New Hampshire, is fifteen miles from the coast and has a population of 15,000. York County in 1959 had 1,283 farms of which 575 are commercial. The number of specialized farms are: Dairy, 670; Poultry, 408; and Apple farms, 156.

In 1954 the community faced a grave crisis when the major textile industry moved out. The need for vocational educational to prepare labor for new employment was

immediately recognized, and plans for such a program were initiated by the school administrators. As a result of this effort the vocational program moved into a new building in 1960.

At the present time Sanford has a four-year senior high school with an enrollment of 960 pupils and 49 teachers. The school serves eight other towns, representing 300 tuition students. Next year the total enrollment will be nearly 1,100 students.

There are five vocational teachers on the regular staff, not including Home Economics, and twelve special teachers for the adult program. The enrollment in the vocational day school program, excluding Home Economics, is around 285 pupils. Of this number 45 are enrolled in Vocational Agriculture, and 46 percent of those are tuition pupils. The adult program in Vocational Agriculture has enrolled from seventeen towns, or 61 percent of the towns in York County.

Course offerings for the day school classes in vocational education now include: Machine Shop, Power Mechanics (automotive), related subjects (drafting, drawing and blueprints), Agriculture, and Home Economics.

The adult program offers courses in General and Heliarc Welding, blueprint reading, oil burners, Automotive (technical), Sheet Metal, Agriculture (farm buildings, soils), Creative Art and Bookkeeping.

Starting next fall, Maine will have another consolidated program in agriculture involving five towns and two vocational agriculture departments.

****

Address by Dr. Carsie Hammonds

"Our Concern with Doing in Learning" was the title of a major address by Dr. Carsie Hammonds, Head, Department of Agricultural Education, University of Kentucky. Dr. Hammonds' presentation was followed by a questioning panel comprised of V. R. Cardozier, Everett Lattimer and Wenroy Smith.

Dr. Hammonds' presentation was mimeographed by Dr. Clodus Smith, University of Maryland, and it has been mailed to all State staff members. A few of the especially significant statements which he made are as follows:

1. There can be no adequate training in vocational agriculture (farming or other agricultural vocations) that does not have its foundation in participation in the tasks for which the abilities are needed. That is why we have supervised or directed practice.

2. Practice is essential to learning. Our students must do what we would have them to learn to do.

3. Without supervised farming, vocational agriculture would not have been vocational. It would not have survived.

4. The public wants vocational agriculture that results in the ability to do. Somehow the public realizes that both the social and the economic worth of man depends upon his doings.

5. Theory and practice must be experienced together in learning if they are to contribute to each other.

6. We learn what we do or practice: Continued use or practice is usually necessary for retention of the learning.

7. If the "doing" is to result in the desired learning, supervision of the doing is needed. If one is to learn from the errors he makes, the errors must be noted and understood by him so that a more adequate response can be tried.

8. Regardless of what may come under the umbrella of vocational agriculture, it is my opinion we should have good supervised practice - that the learning should be brought "to an end by action."

9. The ability of students to generalize depends greatly on their experiences related to the learning situation - their concrete experiences. If students have not had the necessary experiences, the experiences should be provided - in school or out.

10. We cannot teach everything in agriculture specifically. What we teach must be taught so as to secure a large amount of transfer, much use in other situations.

11. One does not teach unless he has teaching objectives. Teaching is an intentional process.

Note:

A new 1963 mimeographed publication (181 pages) by Dr. Hammonds is entitled "A Basis for Effective Teaching." One will gain a deeper insight in the principles of teaching by reading it.

Wednesday Afternoon, April 3, 1963

Chairman: R. C. Butler Secretary: W. H. Evans

The session was called to order at 1:30 p.m.

Morton LeBow, Information Specialist, Social Security Administration, Baltimore, Maryland, explained "A Teaching Unit on Social Security." He stressed the fact that many people in agriculture did not know benefits to which they might be entitled under Social Security. Dave McClay made a few comments as to how the unit was developed and how it might be used in our instructional program. Copies of the unit were distributed.

Noteworthy Developments for Post High School Youth

1. New Hampshire - Programs at the Thompson School - Neal Andrew

The Thompson School of Agriculture is a two-year program designed primarily for post high school youth. In recent years, the emphasis on instruction has been shifting in the direction of technician type training. The three basic curriculums, including general agriculture, animal science and horticulture, are still being offered. Three years ago an agricultural business course was added to the curriculums and this past year a course in forest technology and soil and water conservation were introduced. Al areas of instruction are currently in operation but by far the most popular is the forest technology. Thompson School graduates continue to be in high demand. Applicants for admission to the school are turned away each year due to lack of facilities to handle all who wish to enroll. It is felt that the success of the Thompson School has been due largely to the vocational background of its instructors for each one is a qualified teacher of vocational agriculture. Some attempts have been made to

combine instructional staff with that of the four year college. The administration of vocational education has felt strongly that this was not practical or in the best interest of the Thompson School program.

Forestry instructors are not fully qualified in vocational agriculture because such individuals are not available. However, each one is in the process of becoming certified.

****

2. Delaware - Plans for the Sussex County Vocational-Technical School
Daniel E. Koble

Dan Koble projected plans for the Sussex County Vocational-Technical School. He stated that Delaware is the second smallest State in the Union, being only 100 miles long and 36 miles across at the widest point. Living in this relatively small area are about 500,000 people and this population is increasing each year at the rate of 18,000 new citizens. This situation creates for agriculture not only problems but many opportunities as well. The State is blessed with fertile soil and a moderate climate. Evidence of this is the fact that the cash receipts from marketings per farm averages about $20,000 per year. This is the third highest in the nation and is exceeded by only Arizona and California. An even greater agricultural asset is the fact that Delaware farmers are located within a half day's drive of 30 million potential consumers.

Agriculture in Delaware is changing: In 1950 one out of five persons lived on a farm but by 1960 only one out of every twenty citizens lived on a farm. Today Delaware is the fifth fastest growing State in the country. To give you some idea of the impact this increasing population has on agriculture, here is a partial list of the space and service requirements which accompany each 1,000 new people added to our population. One thousand new people equal about 270 families. They require approximately 130 acres of land, 270 more houses, 400 more automobiles, 2 more miles of improved streets, 7 more classrooms, 10 more teachers and about 120,000 more gallons of water per day.

Two years ago a vocational-technical center was established in one of the three counties of the State. At that time a course in farm machinery repair for grades 10 through 12 was added. This year plans were made to convert this program to a post high school level and title it "Farm Equipment Technology." Local departments of vocational agriculture will serve as feeder schools in supplying students with backgrounds in general agriculture to these technical level training progams.

****

Talk by Mr. Lane Ash

Lane C. Ash, Deputy Assistant Commissioner for Vocational and Technical Education, addressed the Conference. He referred to the Panel of Consultants' report and predicted a bright future for Vocational Education. Also there is a reservoir of talent in vocational education which can be tapped in resolving problems of unemployed youth currently estimated to be 700,000 to one million.

He also pointed out that Manpower Training and Development and ARA are indicative of new challenges confronting vocational education. He also expressed concern for the "poor image" which is being presented to the public through articles in current magazines such as Harpers and The Saturday Evening Post.

Tour

At 3:00 p.m. the Conference toured the Camden County Vocational School and observed the outstanding work of its vocational agriculture department in the area of Ornamental Horticulture and Landscaping.

Thursday Morning, April 4, 1963

Chairman: Joe P. Bail Secretary: Tom McGarr

The session was called to order at 8:30.

Dr. William Drake gave the invocation.

Experimental Research

Charles C. Drawbaugh described a teaching experiment in the use of greenhouse facilities which he conducted with the cooperation of twenty-seven departments in the State of Pennsylvania.

According to the 1959 census, the horticultural specialty industry in Pennsylvania is a 54 million dollar business. Pennsylvania ranks second in total sales volume in the United States in horticultural specialty items. There are more than 3,500 establishments which account for the State's total volume having 17.7 million square feet of greenhouse area. The number employed in the horticultural specialty business in Pennsylvania totals more than 10,000 people.

Operational Structure for Future Research Conferences

Clodus Smith presented a paper indicating the thinking of the 1962 Regional Research Conference which provides a bond between the North Atlantic Regional Conference and the Regional Research Conference through representatives of the five standing committees. These representatives and a representative of the host State comprise the Regioanl Research Conference Planning Committee. Tenure of the Planning Committee will extend from one Regional Conference to the next. The U. S. Office of Education representative will serve in a liason capacity to the Regional Research Conference Planning Committee.

Note:

See page 11, Proceedings of the 1962 North Atlantic Regional Research Conference for a diagram of the operational structure.

Plans for 1963 Research Conference at Cornell University - Dr. Harold Cushman

The general theme for this year's Research Conference will be "Research for Program Adjustments." The Conference will be held at Cornell University on November 5, 6, & Emphasis will be equally divided into three categories:

A. Progress reports of studies identifying vocational training needs
B. Sharpening research competency
C. Action Committee will begin the work assigned it

The Research Conference is an activity of the North Atlantic Regional Conference and will include representatives of all the teacher training institutions in agriculture for the North East and a representative from the supervisory staff in each State.

The 1964 Research Conference tentatively is scheduled to be held at the University of Maryland.

Notewort Developments in Adult Education in Agriculture (Includes Young Farmers)

1. Rhode Island - Programs for Urban People - John Ball

An adult class centered around "Beautifying the Home Grounds" enrolled thirteen persons, all from urban areas. Those enrolled were very much interested in landscaping and did much to beautify their surroundings. The teacher made wide use of visual aids, demonstrations, field trips, the school greenhouse, and group discussions in teaching the class. All members were provided individual instruction at their homes.

****

2. New Jersey - Programs in Landscaping and Turf Management - Adam P. LaSota

In the fall of 1957, accompanied by the State Supervisor, I paid a visit to the Union County Park Commission to discuss the possibility of the Commission hiring some of our senior Vo-Ag students for work experience. During our discussion the question of our training park employees arose.

The discussion was followed up with a plan of training which was presented to the Superintendent of Maintenance and Construction and approved wholeheartedly.

This program included lectures, demonstrations field trips and follow-up visits which covered plant propagation, shade tree management and turf management. It covered a period of 10 weeks during which we met for two evenings a week for two hours each meeting.

The program was of great value to the 37 enrollees men as well as the group they represented. In the first place we provided them with information and training which improved their abilities as employees. This was evidenced by the fact that each of the students who attended at least 70% of the meetings received a certificate and the certificate immediately made them eligible for the next step on their salary guide

In the second place the program provided more competent employees for the County Park System. This system is the largest in the State. It operates two, eighteen-hole golf courses, fourteen parks, as well as maintains grasslands and picnic grounds along every brook in the county. The commission is in constant need of trained personnel as well as men with supervisory ability. Our program has provided them with such men.

Since the inception of this program training has been provided in tractor repair and maintenance, small motors, welding, landscaping in parks, selection of annuals, perennials, insects and diseases of shrubs, aquatic weed control, safety and individual instruction on the job.

****

3. Maryland - Countywide Programs in Farm Business Management - Harry McDonald

A program in Farm Business Management, patterned somewhat after the Minnesota program is operated in Montgomery and Frederic Counties in Maryland. A full-time instructor of adult farmers has been employed in Montgomery County for several years. He has 80 enrollees and has developed his own record book. Many of the farmers keep comprehensive records which are summarized and analyzed by the instructor. The instructional program deals with the solutions to problems revealed by the records of the enrollees as well as the mechanics of keeping records.

In Frederick County the adult program in farm management is two years old. One teacher devotes full time to the work. Another full-time teacher of adult farmers will be employed immediately. The program is operated in four different centers. The enrollment exceeds 100 farmers. Each farmer pays $15 - $20 to have his records summarized. Class sessions are centered chiefly around the problems revealed by the records and current agricultural policies.

****

4. Massachusetts - Programs for the Unemployed - Jesse A. Taft

Three programs for unemployed persons are presently being conducted. The objective is the training of arborists. All programs are being conducted at the three county agricultural schools. The Bristol program operated under the Area Redevelopment Act. The Essex and Norfolk programs are under the Manpower Development and Training Act.

Last fall, one ARA program was completed for arobrists at Bristol. Thirteen individuals completed the course. All were placed with tree service firms. This class was conducted by a day-school instructor, supplemented by a specialist from the University for some tree climbing and rope work. A second class is now in training for arborist work at Bristol.

Three special instructors who operate tree service firms have been employed. Regular day-school instructors teach the related subject matter between 3:30 p.m. to 5:00 p.m. About 20% of the course is devoted to related subject matter.

These programs were initiated on the basis of the industry's needs as expressed by the Massachusetts Arborists Association. According to the Association's estimate, there is a need for 2,000 trained arborists to meet the current need. These jobs are not considered seasonal although some lay-off in large firms takes place in the winter months.

Our experience has shown that an ample supply of qualified trainees exists. It has been necessary to place individuals desiring training on a waiting list. At the outset it was our plan to equip only two centers - one on the North Shore and one on the South Shore. However, we were pressured to set up a third center because of 20 additional referrals for training as arborists.

Budget to Establish an Arborist Course Ranges Between $7,700 - $9,500

Initial costs run high----------$500 - $600 per trainee
Succeeding classes run less----------$400 per trainee

Instructors are paid $25 for a six-hour day

Related subject teachers are paid on an hourly basis - $4 - $5
Teacher serving as both instructor and supervisor - $6

Length of Course - 400 hours to 480 hours

Experience has shown that a 10 week's course of 40 hours each is optimum to train an arborist acceptable to the employer.

Trainees Equipment - Special shoes are purchased and given trainees at the end of the course.

Insurance - Group liability coverage for instructor and 15 trainees is purchased at $480.

Establishing a program under either the ARA or MDTA is a frustrating experience. Excessive paper work and approval required of so many agencies and persons make the program very cumbersome. Our experience indicates that it takes ten weeks to set a program into operation.

****

Rural Areas Development

Mr. J. L. Patrick of the Rural Areas Development Office in Washington, distributed to each State Supervisor a set of slides and an accompanying script describing the aims and objectives of the RAD Program. He requested the supervisors to make the slides available to their vocational agriculture teachers.

Mr. Patrick stated that vocational agriculture is more important today than ever before. Many rural families are living in dire poverty. They need training and an educational program to help them improve their standard of living.

The Rural Area Development Department is eager to help supply speakers at State Conventions if requests are made to the Washington Office. He strongly recommended the use of the RAD Department as contact agents for all departments in the U.S.D.A.

The Supervised Work Experience Record Book in Vocational Agriculture - Howard Martin

Dr. Martin explained that a revision of this book began as a Regional project and was developed into a national project under the guidance of Neville Hunsicker. The Regional Committees met with the national staff in Washington in making the final revisions.

The Committee's objectives were:

1. To reduce the size and cost of the book
2. To develop a record book exclusively for students on work experience
3. To develop a record book which might be adapted for occupations other than farming
4. To eliminate the project enterprise records as a part of the Work Experience Record Book

The following changes were identified:

Page 1. A concise resume' of career selections of student resulting from previous units taught by the agricultural teacher in the field of guidance.

2. Space for recording farm information for more than one farm.

3. Space to record supplementary agricultural work experience other than farm placement.

4. Space for recording managerial abilities developed.

5. Permits each teacher to develop his own rating system.

6. The placement agreement form has been toned down so that the employer would be more anxious to cooperate in signing it. The employer should recognize that placement is a training program.

8. The parents have an opportunity to check and approve the living and working conditions made available to their boy or girl.

A teacher's guide was developed by the committee. A limited number of mimeographed copies are avialable to each State. The committee did not have time to have the guides printed, but this will be done by January 1, 1964.

Professionals Relations Committee

Dr. R. C. Butler gave the report of the Professional Relations Committee. (See page 10)

Recent Developments in the FFA

1. The National FFA Board of Directors - H. E. Edwards, regional representative on the FFA Board, called special attention to the following:

a. Revisions in the application for the American Farmer Degree and the new procedure for selecting and approving them.
b. The efficient and expanding operations of the FFA supply service. A new wing (7000 sq. ft.) has been added to the building.
c. The neccessity to increase the subscription rates to 50¢ for the National Future Farmer Magazine. The price of the FFA calendars has been reduced substantially. States are urged to further promote the use of both of these public relations media.
d. State associations should call to the attention of chapter members the National FFA Code of Ethics and the official Policies Regarding the use of the FFA Name and Emblem. Close adherance to these policies should be encouraged. See pages 14 and 122 in the FFA manual (1963 Edition)
e. The FFA plans to increase its international activities.

2. National FFA Judging Contests - W. H. Wayman, regional representative on the Special Study Committee for National Judging Contests, reported the recommendations of his committee and called attention to the fact that further consideration and final decision will be made on contests and regulations by the committee during the 1963 FFA Convention. The question of combining such contests as Dairy Cattle and Dairy Products will be discussed. Other events such as Production classes of poultry may be eliminated and other events added. State Staff members are requested to keep the regional representatives (Wayman and Hoover) informed of their wishes.

3. National Future Farmer Magazine - A report of the subscription status by States and the operation of the National Future Farmer Magazine was made by Wilson Carnes, the editor. He stated that FFA members in six States in the region subscribe 100% but there are also more than 9000 members who are not subscribing. The magazine should become a part of the total vo-ag program for each student.

4. Peace Corps - A. W. Tenney

A contract will be signed in the near future for an FFA - NFA Peace Corps Project in Pakistan. A total of 40 persons will be selected. The candidates should be 18 years of age and former FFA or NFA members.

A pending arrangement with Columbia may necessitate another 40 persons. This is the start of an International Agricultural project by the FFA and NFA.

Mr. James Lay, Agricultural Department of the Peace Corps, also was introduced and told about successful Peace Corps projects.

Dr. Spanton's Comments

Dr. Spanton described an inequality which exists in the present civil service retirement program. Teachers of vocational agriculture cannot receive retirement benefits for the length of service at the local and State levels. He hopes that vo-ag teachers will have the same opportunity as others serving the Federal government by being able to pay into the Federal retirement program after serving for five years. Legislation which would make this possible has been introduced on two occasions and has received an adverse vote. He hopes that the present bill will be adopted so that the ten thousand people who should benefit by this law will be permitted to do so in subsequent years.

Thursday Afternoon, April 4, 1963

Chairman: Raymond C. Northup Secretary: Claude McGhee

The session was called to order at 1:30.

Business Session

Dr. Norman Hoover, Regional AVA Chairman presided. Wallace Elliott presented the following report of the Nominating Committee. It was accepted and the individuals were elected to the respective positions:

Position	Name	State
1. Program Committee Five-year Term (1963-1968)	Joe Paul Bail	New York
2. National FFA Board of Directors Two-year Term (1963-1965)	Neil Andrew	New Hampshire
Alternate	James C. Fink	Pennsylvania
3. AVA Regional Group Two-year Term (1963-1965)		
Chairman	George Lange	New Jersey
Vice Chairman	Norman Hoover	Pennsylvania
Secretary	Clark Butler	West Virginia
Alternate Secretary	V. R. Cardozier	Maryland
4. National FFA Judging Contests One-year Extension To July 1, 1964	Norman Hoover	Pennsylvania
	W. H. Wayman	West Virginia

CONFIRMATIONS (Con't)

Position	Name	State
5. National FFA Convention One-year Term	W. H. Wayman	West Virginia
	Norman Hoover	Pennsylvania
6. National Study Center One-year Term (1964)	H. E. Edwards	West Virginia
Four-year Term (1967)	C. W. Hill	New York
7. Teacher Education Committee Three-year Term (1963-1966)		
Chairman	Bruce Gaylord	Vermont
Vice Chairman	Warren Kelly	West Virginia
Secretary	V. R. Cardozier	Maryland
8. Professional Relations Committee Three-year Term (1963-1966)		
Chairman	William Drake	New York
Vice Chairman	R. C. Butler	West Virginia
Secretary	Dan E. Koble	Delaware
9. Supervisors Group Two-year Term (1963-1965)		
Chairman	W. H. Wayman	West Virginia
Vice Chairman	Cola Watson	Vermont
Secretary	L. L. Turner	Connecticut
10. Research Committee Vice Chairman (unexpired term - 1964)	Harold Noakes	New York

****

Resolution: Liason Requested Between Vocational Agriculture and the U. S. Department of Agriculture

Motion passed unanimously that the North Atlantic Regional Conference group submit the following resolutions to the Director, Agricultural Education Branch, U. S. Office of Education, to be transmitted to the Secretary, U. S. Department of Agriculture:

"Be it resolved that due to the increasing complexity of agriculture and the rapid changes and developments taking place in it technically, professionally and in government agriculture programs. And, also due to the desire of workers in vocational education in agriculture to be kept informed of such changes and developments, the U. S. Secretary of Agriculture is hereby requested to favorably consider the assignment of a member of his administrative staff as a liason between the U. S. Department of Agriculture and the staff of the Agricultural Education Branch, U. S. Office of Education. It is also requested that the Director of the Agricultural Education Branch be asked to transmit this resolution to the Secretary of Agriculture and to explain to him personally the intent and over-all purpose of this resolution as well as the desire of the North Atlantic Regional Conference group to work closely with the agencies of the Department of Agriculture in advancing all phases of agriculture."

Committee Reports

1. ASAE Committee report was presented by Dr. Frank Anthony. He stated that a National office of the Farm Electrification Council (FEC) has been established in Oakbrook, Illinois and that Mr. John Turrell is the full-time coordinator and Executive Secretary. Mr. Turrell has asked for the cooperation of teacher educators and supervisors in the area of farm mechanics to assist in the establishment of State Councils of FEC so that educational programs in farm electrification may be expanded. The membership to the State Councils will include representatives of power companies (private and cooperative), Department of Agriculture Engineering and Department of Agricultural Education in the State Department of Public Instruction. Teachers of agriculture may look forward to a valuable source of teaching materials in farm electrification as State Councils are established in each State.

Attention was called to the fact that the FEC annually sponsors a dinner meeting on Friday noon during the National FFA Convention in Kansas City for all State Winners of the FFA Foundation Farm Electrification Award. Each State in the North Atlantic Region is invited to send its State winners plus his vocational agriculture teacher and State Advisor or his representative.

2. The Treasurers Report for the Regional Conference was presented by Dr. Clodus Smith.

April 6, 1962 - Balance was - $ 83.96
April 4, 1963 - Balance was - 110.24
(Complete report was distributed and a copy is on file)

3. Plans for the 1964 Regional Conference were outlined by Wallace Elliott, Program Committee Chairman.

Date - April 6 to 10, 1964
Place - New England area - The Planning Committee to determine the specific location
Note: (The 1964 Conference will be held at the Hotel Somerset in Boston, Massachusetts.)

4. Evaluations of the 1963 Conference were collected by H. E. Edwards..

5. National Center for Advanced Study and Research in Agricultural Education

a. H. E. Edwards gave a brief progress report:
(1) The National Committee of which he and Dr. C. W. Hill are members representing the North Atlantic Region, met in Washington July 26-27, 1962 and selected Ohio State as site for the center. The

choice was unamious. Applications were received from six States.

(2) Dr. Robert E. Taylor was named Acting Director of the center on August 23, 1962.

(3) The National Committee met in Milwaukee on December 2, 1962 and approved a statement of policies governing the center. Dr. Taylor's title was changed to Director and he will devote full time to this position.

(4) Summary: Our National Center for Advanced Study is no longer a dream. Many people want to come in with us to make the Center a National Center for Advanced Study for all of vocational education. Our success will be dependent on you people. We need ideas, participation and support---now, and in the future.

b. Dr. Robert Taylor, Director of the National Study and Research Center, reported:

(1) The desirability of Federal funds to help support the Center.

(2) The main role of the Center is to supplement and enhance existing graduate and research programs.

(3) All activities will not be confined to Ohio State. Workshops will also be held on a regional basis.

(4) The National Agricultural Education Seminar will be held at Ohio State University, July 22 - August 2. The theme for the conference will be "A Design for the Future." The Seminar will be centered around State staff responsibilities and implementing recommendations of the Panel of Consultants.

(5) Many outstanding leaders in vocational education will participate in the Seminar.

(6) Seminar will be non credit, but credit can be arranged. Every State should be represented by a supervisor and a teacher trainer; 32 States now registered.

Noteworthy Developments in Agricultural Education - In Special Services and Facilitie

1. Connecticut - Using a State Consulting Committee - L. L. Turner

a. The State Consulting Committee of Connecticut consists of 23 members representing: the State Department of Agriculture, the College of Agriculture, a farm newspaper editor, public utilities, farm director of a broadcasting company, the high school principal's association, teacher trainer, a farmer cooperative, a farm business, a superintendent of schools, Farm Bureau, president of Vo-Ag teachers and farmers. The committee meets annually during National FFA Week.

b. The committee has prepared ground work material and has proposed bills passed by the 1955 legislative session. These bills were prepared so as to:

(1) Provide for local control of policy and administration of vo-ag within the frame work of the State Plan.

(2) Provide State aid to prevent financial burden on towns receiving students from other towns.

(3) Provide a facility which can serve as a community agricultural center.

(4) Provide State aid for sending towns operating their own high schools, so that there would be little increased financial burden to sending towns. (townships & districts)

(5) Provide State support for adult programs.
(6) Provide State aid for transportation in sending students to vo-ag centers.
(7) Provide equitable distribution of Federal funds for vo-ag regardless of the amount received by the State.

C. Consulting Committees are needed at the State level to a greater extent as time progresses. The Connecticut committee is a group with good attendance, high enthusiasm and noteworthy progress.

****

2 Vermont - Continuous Inservice Training for Teachers - Bruce Gaylord

A. Pattern of inservice training in Vermont:
(1) Follow up of first year teachers with an average of six visits by teacher trainer
(2) Evaluation of all first year teachers by supervisor, teacher trainer and supervising teacher.

B. Annual self-evaluation is conducted by all teachers by use of the "Supervisory Guide." All teachers use their findings in redesigning their annual programs.

C. The structure of the Vermont Agricultural Teachers Association is patterned after the NVATA. Through use of committees the teachers participate in carrying out all phases of their State association's program.

D. Conferences include: (1) Joint Vermont - New Hampshire Agricultural Teachers Conference, (2) Sectional Vermont Vocational Association, (3) Sectional and joint Vermont Education Association.

E. Summer session offerings are provided annually, workshops are conducted annually, and individual conferences are scheduled throughout the year.

****

3. New Hampshire - A New Approach to Teacher Education - William H. Annis

The Department of Agricultural Education, University of New Hampshire has recently become the umbrella covering the pre-service training and graduate programs for both vocational Agriculture and Agricultural Extension. Dr. Hammonds in his book Teaching Agriculture, states: "All school teachers of Agriculture should be familiar with the work of the Extension Service. Likewise, all persons engaged in Extension Work in Agriculture should be familiar with what the schools do, or should do in teaching Agriculture. Extension is an educational enterprise----Thus, teaching Agriculture, whether through the school or through some other agency, qualifies as a profession." We have merely accepted Dr. Hammonds' philosophy at the University of New Hampshire. We did not modify the name of the Department, but rather accepted the concept that Extension personnel were working in Agriculture and by virture of their programs were educators. Agricultural Education is the umbrella covering both Extension Education and Teacher Preparation in Agriculture.

The program can perhaps be visualized through the continued use of the umbrella. As an umbrella is composed of ribs and sections, so our program is composed of courses. Here we see the first pre-service course, Principles of Agricultural Education. This course covers basic data of both the Vo-Ag and Extension work. It includes the role of teaching in our society today; the history and philosophy of Vo-Ag and Extension, program planning and the FFA and 4-H.

The methods course entitled Planning for Teaching is the next portion of our program and is available to both prospective County Extension personnel and Vo-Ag teachers. This course is offered concurrently with supervised practice student teaching and is taught both on and off campus.

The next section of our umbrella is Adult Education. This course is also offered concurrently with supervised practice and is taught both on and off campus. It covers the areas of young and adult farmer education.

The Supervised Practices phase of our program is unique in terms of programming in Agricultural Education. Students are placed in County Extension offices for 8 weeks and in Vo-Ag centers for 8 weeks. This allows each student the opportunity to gain a knowledge of the programs of each agency. A check list of participating experiences for Extension is in the process of being developed and will be used by the students during their supervised practice period in the County Extension offices. The students in Extension offices will be supervised in part by the State Extension personnel as well as by personnel in the Agricultural Education Department. These three courses will be offered during the fall semester each year and open to seniors and graduate students.

A Seminar course completes our pre-service training program and will center on problems encountered during the Supervised Practice phase of the program.

In addition to the pre-service courses, a program of follow-up of first year teachers of Agriculture is conducted by the Department.

A graduate program is available for both teachers of Vocational Agriculture and County Extension personnel leading to a Masters in Agricultural Education Degree. These graduate programs are tailored to meet individual needs through course offering throughout the year. Our completed umbrella consisting of: pre-service courses, follow-up of first year teachers and the graduate program.

This is a program in New Hampshire which it is felt will meet the needs of our State in the preparation of both teachers of Agriculture and County Extension personnel. It is only one approach to the problem. There are others which might be equally effective.

****

Meetings of Action Groups

These meetings were a continuation of the work begun during the Tuesday morning session. The following conclusions of the groups were reported and discussed at the Friday morning session.

Group A - Developing Instructional Programs in Agriculture for High School Youth

Leader: H. M. McDonald Recorder: W. H. Elliott
Keynoter: W. Howard Martin

Five major points were stressed by Dr. Martin, based on the President's Panel Report. Dr. Martin stated that "The Panel's Report, in popular version, implies that the instructional programs for the all-day students should be:

1. Developed with regard to many agricultural careers including farming.

2. Improved with regard to both depth and breadth of experiences.

3. Competitively attractive with other instructional programs in the secondary school.

4. Include necessary instructional materials and facilities.

5. Adaptable, in some situations, to the needs of disadvantaged or handicapped youth."

After considerable discussion by the Committee, seven points were developed for further consideration:

1. Encourage teachers to find off-farm opportunities for "Supplementary Agricultural Work," for students, in addition to their regular supervised farming programs, such as, greenhouses, hatcheries, nurseries, etc.

2. Identify and locate desirable off-farm occupations for graduates that will:
   a. Provide supervised farm work experience
   b. Provide full-time employment after graduation

   Note: In doing this it is recognized that we must be extremely careful not to weaken our present farmer training program.

3. Provide a sufficient number of general units for basic learning, and one or two special units designed to meet individual interests and aptitudes.

4. Insist upon a broad two or three year core program in vocational agriculture prior to providing any higher degree of specialization.

5. Develop area centers for grades 11 and 12 to provide for specific instruction in agricultural occupations.

6. Encourage teachers to attend college for the purpose of specialization, to earn a M. S. Degree, and return to high school teaching.

7. Summarize and study the information available from completed research in order to determine possible courses for action.

It was voted that this Committee recommend that Dr. Tenney be urged to convene, as soon as possible, a series of conferences of supervisors and teacher trainers, to expedite the structure of Agricultural Education Programs to fit today's needs.

Group B - Developing Instructional Programs for Post High School Youth

Leader: R. C. S. Sutliff Recorder: Jesse A. Taft
Keynoter: Neal Andrew

We believe that the leadership in agricultural education within a State has the responsibility to see that systematic post high school instruction in agriculture of less than a Baccalaureate Degree is provided for interested students. Such instruction should develop in the student's salable skills and competencies in agriculture which will assist them to enter into and progress successfully in the occupations of their choice.

The following are the suggested activities in which a State may engage in order to provide for the development of opportunities for post high school instruction in agriculture. No significance is attached to the order of this listing.

1. Assess employment opportunities needing competencies in agriculture including self-employment and farming.
2. Determine agricultural abilities necessary and/or desirable.
3. Cluster these abilities which are necessary and/or desirable.
4. Develop the training program based on the needs
   a. Develop curricula
   b. Develop plan for work experiences
   c. Determine length of courses
   d. Develop criteria for selection of students
   e. Counsel and enroll students
5. Arrange for the selection and training of the teaching staff.
6. Determine and provide facilities and equipment.
7. Determine teaching and other staff needed.
8. Utilize Advisory Consulting Committees.
9. Determine how the program will be financed and administered.
10. Determine how to provide instructional materials and teaching aids.
11. Provide for appropriate public relations activities.
12. Study existing programs of a similar nature in the State and neighboring States
13. Establish program objectives.
14. Evaluate programs periodically.
15. Establish placement and follow-up activities.
16. Secure counsel and advice of other vocational education services.
17. Cooperate with other vocational education services where appropriate.
18. Develop cooperative working relationship with educational institutions in determining programs and providing for continuing education.
19. Develop a plan for recruiting students.
20. Develop operational policy.

****

Group C - Developing Instructional Programs in Agriculture for Adults
(Includes Young Farmers)

Leader: David R. McClay Recorder: W. H. Evans
Keynoter: Cola Watson

1. The different groups of adults with which we are concerned are:
   a. Adult farmers in the business of farming
   b. Young men wanting to become successfully established fully in farming (broad interpretation of farming)
   c. Part-time farmers
   d. Migratory farm workers
   e. Employer-employee relationships of the above groups
   f. Special skill occupational groups
   g. Suburban home owners

2. How are the educational needs determined for the above groups?
   a. Use of existing agencies in communities, such as S.C.S., Ag. Ext., Employment Services, etc.
   b. Knowledge gained from working with adults in courses or from knowledge gained by local teachers in working in the community.

3. Some principles for developing successful instructional programs for adults:
   a. Use local resources and agencies in determining needs
   b. Use agricultural councils
   c. Use advisory committees
   d. Individual on-farm visitation is an important way of determining instructional needs.
   e. The Young-Adult Farmer program should consist of a series of unit courses planned over a period of years to meet the recognized needs of the group.
   f. Education for entry into specialized occupations should consist of the development of considerable competence in skills and understandings required in the occupation by the individual.
   g. Qualified instructors, with time provided them to do the job, should be used for teaching adults.
   h. Graduate programs can stimulate teacher's interest in teaching courses for adults.
   i. One of the functions of a comprehensive high school is to support and to give leadership in meeting the adult education needs of the community. School administrators and boards of educaton should be favorably convinced of the importance of this function of their school. It is difficult for an adult education program to succeed without the blessing and encouragement of the school administration.
   j. More in-service education must be provided in order that the teacher be kept abreast with new developments both technically and professionally.

Friday Morning, April 5, 1963

Chairman: V. R. Cardozier Secretary: Archie Holdridge

After Breakfast Meeting of Supervisors

Approximately 35 supervisors and special guests attended the after breakfast meeting of supervisors beginning at 8:00 o'clock. Harry McDonald served as chairman. A summary of the items discussed as submitted by W. H. Wayman, secretary, is as follows:

A. Farm Management Workshop - Dr. Joe P. Bail reviewed plans for the workshop to be held at Cornell University, June 10-14, 1963. It was stressed that, if possible, all States be represented by a supervisor, a teacher trainer, and a representative of the college agricultural economics department. A tentative program was distributed.

B. New Reporting System in Agricultural Education - Mr. H. N. Hunsicker reviewed and discussed a New Reporting System in Agricultural Education. These forms have been prepared by the Office of Education, Department of Health, Education and Welfare for vocational and technical education. He urged that report forms used in States be reviewed and modified, where necessary, in order to secure the data requested.

C. Improving Supervision - R. C. S. Sutliff reviewed the plan used in certain districts in New York for improving supervision. The school districts are requesting Cooperative Review Service from the State Department of Education. Some information is obtained prior to the evaluation. A team evaluates the total school program. A report is made of the evaluation of the different departments, administration, etc., and then combined into a comprehensive report. This report is reviewed with the local school officials and a check made later as to improvements implemented. A supervisory guide, that has been used in vocational agriculture, was distributed.

D. Provisions for Insuring Equal Opportunities - Dr. A. W. Tenney commented concerning Provisions for Insuring Equal Opportunities. He stated that,"Any Federally sponsored program should be available to all who can benefit from the training."

E. Business Session - Comment by Mr. Ayers, Assistant Administrator, ACP, U. S. Department of Agriculture, reported that the department is eager to cooperate with all States in providing assistance for improving education programs. He stated that every effort will be made to carry out the wishes of this conference group as expressed in its resolution. (See minutes of the Thursday afternoon session

National Study Center - Dr. Robert Taylor briefly described plans for the National Study Center. It is hoped that all States will have a supervisor and teacher trainer attend the seminar to be held July 22-August 2, 1963. Tentative plans are being made to conduct specific workshops. The Central Region Conference suggested that a National Conference be held for FFA executive secretaries.

Proposed Organization of State Vocational Agricultural Supervisors - H. E. Edwards discussed a proposed plan. A questionnaire was distributed to obtain information for planning the new organization.

1962 NEPPCO Report - Neal Andrew reported that the 1962 Exposition was successful. It is important that each State make specific arrangements for serving term as chairman in rotation system. More emphasis should be given in some States regarding proper dress for the occasion. All States should make detailed arrangements for participation. The "Best Poultry Boy" must be present for interview to be eligible to receive the award.

1963 NEPPCO Plans - Jesse A. Taft reported that he attended the Neppco meeting in in New York in January. He briefly outlined plans for the 1963 Exposition to be held in Harrisburg, Pennsylvania, October 6 to 7. Detailed instructions will be mailed to all States. The State Supervisor in Maryland will replace him as chairman in 1964.

Eastern States Exposition - Jesse Taft reported that the name of the Eastern States Exposition Committee has been changed to North Atlantic Regional FFA Planning Committee. Jack Reynolds, manager of Eastern States Expositon, accepted the proposed increased budget and agreed to make the suggested changes and improvements. Plans are being made for participation of a demonstration team of two FFA members from the New England States. Others in the region may participate. Plans also are being made to conduct a Tractor Operation Contest.

Honorary American Farmers - Wallace Elliott listed recommended names for the Honorary American Farmer Degree. H. E. Edwards nominated Harry Grant. Jesse Taft nominated Charles Oliver. By vote the two were approved.

Tri-State Public Speaking Contests - W. H. Wayman, reviewed plans and set the date for the 1963 contests. He called attention to the fact that the States responsible for holding these events in 1963, 1964 and 1965 are listed in the Information Bulletin No. 3591. Host States are urged to follow the procedure recommended by the North Atlantic Regional Conference in 1957.

Recommendations for Improving National FFA Judging Contests - W. H. Wayman reported on proposed changes for the contests. By show of hands the States were equally divided regarding the acceptance of the proposed changes.

Sub-Regional FFA Leadership Workshops for State Officers - L. L. Turner reported that Connecticut State FFA Officers who took part in last year's workshop were better able to help local chapter officers become aware of their responsibilities and do a better job on the local level. An informal poll of the New England States indicated the workshops are worthwhile and should be continued. Problems encountered are: 1. Better coordination between neighboring States in sponsoring workshops. 2. Agreement as to purpose of such workshops. 3. Developing a program. 4. Participation of National officers. 5. Desirable facilities. 6 Costs. 7. Length of Workshop. 8. Time to schedule workshop. 9. Adult participation, and 10. Out-of-State travel.

Problems Facing the Agricultural Education Magazine - Cola Watson stressed the importance of obtaining subscriptions for the Agricultural Education Magazine. The States will be polled regarding change of name for the magazine.

Election of Officers - The following persons were unamiously elected to serve a two year term as officers of the Supervisors Group: Wallace Elliott, Chairman; Cola Watson, Vice Chairman; H. E. Edwards, Secretary.

****

After Breakfast Meeting of Teacher Trainers (AATEA)

Twenty-one teacher trainers and guests attended the after breakfast meeting of AATEA, beginning at 8:00 o'clock. Ben Bristol, chairman, presided and Ralph Barnwick, secretary, recorded the following minutes:

A. Report by Dr. McClay regarding the following highlights of the National Meeting last December in Milwaukee:

   1. Dr. H. M. Hamilin was presented with the first AATEA Distinguished Service Award.

2. Dr. Knuti reported 15,000 copies of the recruiting brochure had been sold @ 5¢ per copy.
3. Dr. Peterson reported that AATEA was now affiliated with AOTE. (Associated Organizations of Teacher Education)
4. Dr. Cardozier, AATEA treasurer reported 139 paid members.
5. President Clarence Bundy appointed a committee to determine the possibility of establishing a summer institute.
6. Dr. Cline would continue as editor of the publication.
7. The need for a Collegiate FFA Convention at the National FFA Convention was discussed.

B. Moved by the group to favor a joint Collegiate FFA - Student teacher meeting at Kansas City in conjunction with the National FFA Convention.

C. The group voted that the Regional section of AATEA endorse the printing of the revised Experiences for Student Teachers in Agricultural Education sufficien for a two year Regional supply.

D. Dr. Cardozier urged all teacher trainers to submit articles for the AATEA Journal.

E. Dr. Bail of Cornell reported on the plans for the Farm Management Workshop (June 10-14, 1963 at Cornell)

F. A discussion of the National Study Center for Agricultural Education and the Agricultural Education Magazine was held.

G. Dr. McClay requested ideas from the group relative to the program for the Agricultural Education section of AVA.

H. Dr. Cardozier reminded the group that a Vice President of AVA for a three year period will be elected at the next convention of AVA.

I. Dr. Annis moved that the program committee consider Portland, Maine as a site for the '64 Regional Conference. Motion passed.

J. Dr. Smith proposed that college programs in Agricultural Education be expanded to include other areas of training. It was further suggested that ample time be provided at a future conference to further discuss these possibilities. Martin suggested that papers be presented on the subject at a future conference. Dr. McClay pointed out that Penn State now offered a course in Agricultural College Teaching.

K. Bail moved that the above topics be included on the agenda for next year's Regional Conference after-breakfast meeting. Action passed.

L. Due to leave of absences and the resignation of Ben Bristol the following new slate of AATEA Officers was elected for a one year term: Clodus Smith Regional Chairman and 1st Vice President; Ralph Barnick, 2nd Vice President; and, William Drake, alternate Vice President and Regional Secretary. The group also passed a motion by Dr. McClay that the above slate of officers serve an additional regular term with offices expiring in 1966. (Note: This motion was not in order since the constitution provides for only two year terms.)

General Session

The general session was called to order by Dr. Cardozier at 11:15.

A Symposium-Panel comprised of H. E. Edwards, Harry McDonald, R. C. S. Sutliff and David McClay summarized and discussed the conclusions of the work groups which met on Tuesday and Thursday. The panel members reported that their respective groups focused their attention on developing "An Agenda for Action" with respect to vocational agriculture in the years ahead. A list of their specific recommendations is included in the minutes of the Thursday afternoon session.

Accomplishing the Agenda for Action - H. N. Hunsicker

The Regional Program Specialist, by use of flannel board, pointed out specific needs which must be met in order to implement the proposed "Agenda for Action":

1. Dynamic Leadership (National, State and local)
2. Adequate Staffs
3. Annual Evaluation of Programs
4. Program Planning - (Especially by State Staffs)
   a. Get facts - Discover real needs
   b. Set goals
   c. Develop ways and means
5. Modernized Courses of Instruction
6. Realistic Enrollments
7. Consulting (advisory) Committees
8. Pre-service and Inservice Training for:
   a. Teachers
   b. School Administrators
   c. Guidance Workers
   d. State Staffs
9. Improved Image of Vocational Agriculture
   What It Is?
   Where It Leads?
   a. Personal Contacts and Relationships
   b. Publicity
   c. Be Represented
10. Get started

"The future belongs to those who prepare for it."

Adjournment

1. Dan Koble and James Fink were cited for their special assistance with the conference arrangements and registration.

2. Appreciation and an appropriate gift was presented to Mrs. Harriet Purnell, secretary to Mr. Koble, for serving as secretary for the conference.

3. The conference group expressed regrets to Ben Bristol of Pennsylvania upon his leaving the Region but wished him well in his new location.

4. Neville Hunsicker, A. W. Tenney, A. H. Hollenberg and the Program Planning Committee were given a rising vote of appreciation and applause for their effective contribution and work in making this a worthwhile and successful conference.

5. The Conference was adjourned at 12:35 p.m.

DOCUMENT NOT AVAILABLE FROM EDRS 63p.

*VOCATIONAL AGRICULTURE, *OFF FARM AGRICULTURAL OCCUPATIONS, *OCCUPATIONAL CLUSTERS, EMPLOYMENT LEVEL, EMPLOYMENT OPPORTUNITIES, WORK EXPERIENCE, *EMPLOYMENT QUALIFICATIONS, SALARIES, AGE, RESIDENCE REQUIREMENTS, *EDUCATIONAL NEEDS, OCCUPATIONAL SURVEYS, EDUCATIONAL SURVEYS, EMPLOYERS,

Louisiana, Monroe,

The objectives of this survey, one of seven area studies in the state, were to identify off-farm agricultural businesses, to secure qualifications for the jobs, and to determine agricultural training requirements. Using a survey questionnaire, trained interviewers gathered data from businesses identified as agriculturally oriented. Of the 4,110 employed in 108 agricultural firms, 1,225 in 222 job titles needed agricultural knowledge and skill. When classified by occupational families, it was found that -- (1) crops, forestry, and soil conservation, and (2) farm supplies and equipment were prominent. Unskilled, managerial, and semiskilled levels of employment were most frequently reported. There were few at the professional and technical levels. Preferred job entry age was between 25 and 45. Employees with more training and experience received higher salaries. Employers favored employees with high school and college education. Employees with a farm residential background were not favored, though farm experience was important. The greatest need for familiarity with agricultural subjects was in the managerial, supervisory, sales, and skilled levels of employment. Firm or industry schools and on-the-job training were preferred over public vocational school and agricultural colleges, as presently constituted for continuing education. Recommendations are included for revising training programs. (JM)

PREFACE

The rural boy of today who does not plan to farm and desires employment in nonfarm agriculture finds himself in an "occupational gap" which is too large and deep for him to bridge successfully. Many occupational opportunities that could be available to him exist as merely "dreams" because of his lack of training and experience in jobs occurring in the emerging, broad agricultural complex known as "agribusiness". The urban boy, consequently, competes favorably in securing many of the jobs earmarked for rural youth.

This report is one segment of a statewide study which was designed primarily to locate and identify job titles in agricultural occupations and provide job descriptions, including knowledge and skill required for securing employment. This kind of information will serve as an invaluable tool for school administrators, counselors, and teachers of vocational agriculture who will be planning programs in vocational agriculture to meet the needs of individuals who anticipate employment in nonfarm agriculture.

ACKNOWLEDGEMENTS

This REPORT was made possible by action of the Louisiana Vocational Agricultural Teachers Association, the Vocational Agricultural Education staff, and the State Department of Education, in obtaining a grant from the Board of Liquidation of the State Debt for use by Louisiana State University in making this study.

Invaluable assistance in making the Monroe-West Monroe survey was extended to University researchers by the Division of Employment Security and officials of the Monroe and West Monroe Chambers of Commerce.

Appreciation is also expressed to the 108 businesses and agencies cooperating in the Survey.

OCCUPATIONAL OPPORTUNITIES AND TRAINING NEEDS OF YOUTH FOR NONFARM AGRICULTURAL JOBS IN THE MONROE-WEST MONROE AREA

by

C. M. Curtis* and Anthony Mumphrey**

INTRODUCTION

Monroe and West Monroe, the Twin Cities of the Ouachita River Basin, are the hub-center for a vast trading region comprising some 18 parishes. The twin cities act both as a retail and wholesale distribution center for nearly 500,000 people in the North Louisiana-South Arkansas Region.

Monroe, the Parish seat of Ouachita, has approximately 62,000 inhabitants; while West Monroe's population is 19,000. Nearly 69 per cent of the population of the Parish is concentrated in this Metropolitan Area. This Metropolis, therefore, is the major generator of employment opportunities.

Total farm population in the 18 Parish Region is 69,566; Monroe-West Monroe businesses and agencies service the farm population needs.

In addition to off-farm agriculture in the total trade Area, there are some 19,520 farms. These farms comprise more than 2.5 million acres; the average size farm is approximately 142 acres. Major crops for this Area include: cotton, corn, row crops and grain. Dairying and beef cattle enterprises have developed into a sizeable entity in this Agricultural Complex.

Within the Metropolitan Area some 100 manufacturing plants of widely diversified products are included in the total economy. The major manufacturing

---

*C. M. Curtis, Associate Professor of Agricultural Education
**Anthony Mumphrey, Associate Professor of Agricultural Education

interests are in paper and paper products, furniture manufacturing, and chemicals. More than 5,500 employees can be found in manufacturing interests alone, with retail trade employing over 5,000 workers.

Twenty per cent of the job opportunities are in retail and wholesale trade; total employment is encompassed in some 41,150 jobs. Government establishments offer approximately 5,300 positions, while service trades account for over 4,200 employees.

Although agriculture appears to include a significant segment of the entire economy of the Area, vocational agriculture is not presently offered in any of the secondary schools in the Metropolitan Area under investigation, and there is only one Department of Vocational Agriculture in the Parish, namely, Calhoun.

Monroe and West Monroe have shown a most progressive growth during the last five years. A greater movement to the suburbs has been underway for the past three years. Major growth in the future can, therefore, be expected primarily in the fringe areas. Such a movement will ultimately lead to the further development of the Area for additional diversified progress and expansion.

PURPOSE OF THE SURVEY

The Monroe-West Monroe survey constitutes one distinct segment of a Statewide study of seven metropolitan areas. Each metropolitan area contributed to the Statewide report compiled with the data of the seven areas under investigation.

The primary purposes of the survey were: 1) to identify nonfarm agricultural businesses and professional organizations having one or more job titles requiring competence in agricultural subjects, 2) to secure specific qualifications for jobs, and 3) to determine the kinds of training in agriculture associated with job entry and maintaining competence in employment.

This comprehensive study of agricultural occupations was made possible by a grant to the University from the Board of Liquidation of the State Debt.

The general objective of the study was to provide leaders in education in public schools with information concerning present and emerging occupations in agriculture other than farming and ranching for which instruction in vocational agriculture is profitable and essential.

An agricultural occupation other than farming and ranching, for purposes of this study, refers to one for which individuals need competencies in one or more of the essential areas of plant and animal science, agricultural business, management and marketing, and agricultural mechanization.

In order to help determine the changes necessary in high school programs of vocational agriculture, it was assumed that the following data were essential:

1. Number of employees in each and all agricultural business firms or organizations, including employee identification according to job title

2. Competencies needed in agricultural subjects or skills required to gain job entry and for advancement, and

3. Distinguishing characteristics of all job titles such as: salary or wages, entry age, required formal education and experiences, legal restrictions, and union regulations, licensing and certification and a description of work performed by workers within a specific job title.

SURVEY PROCEDURE

All nonfarm agricultural businesses and organizations within the Metropolitan Area of Monroe-West Monroe were surveyed in this study.

General data concerning this area reveal the significance of agriculturally oriented businesses to the economy of this sector of the South.

A comprehensive list of all agriculturally oriented firms and businesses was developed for the Monroe-West Monroe Area; the list was evaluated and finalized to include those firms having one or more employees with knowledge or skill in agricultural subjects. This list was supplemented with business listings secured from the Yellow Pages of the local Southern Bell Telephone Directory,

the several trade associations, records of the Monroe and West Monroe Chambers of Commerce, and the local Division of Employment Security.

The Agricultural Committee of the Chamber of Commerce gave its endorsement to the study. Officers of the Chamber corresponded with owners or representatives of the business concerns, thus facilitating subsequent interview procedures. In addition, the Dean of the College of Agriculture, Louisiana State University, sent a letter of explanation concerning the study to each firm. The local newspapers; namely, The Monroe Morning World and Monroe News Star, gave supporting publicity for this investigation.

To establish a platform from which to launch the study, the local Division of Employment Security recruited a group of prospective interviewers. This group was reduced to six and trained by University Personnel in the proper procedures to conduct the study. The instruments were completed in an eleven day period under the direct supervision of University personnel.

Each interviewer was given a list of firms to survey; each worker making his own arrangements with the employer or his representative relative to the time of interview. All information pertinent to the investigation was noted, using the survey instrument developed for the Statewide study.

A total of 108 agricultural businesses provided data for this report; 100 per cent of the firms were categorized as having nonfarm agricultural occupations.

The agricultural businesses in the Monroe-West Monroe Metropolitan Area employed 4,110 employees with 1,225 having competencies in agriculture. A need for 117 additional workers having agricultural competencies was indicated. Only 29.8 per cent of the total employees were found to have special competencies in agriculture. This determination reveals a large segment of the total agricultural business functioning with individuals not possessing specialized training in agricultural subjects.

TREATMENT OF SURVEY INFORMATION

To facilitate an orderly presentation and interpretation of survey information, the data gathered were categorized to include the following:

1. Occupational families
2. Classification of job titles into levels of employment and training required in agricultural subjects, and
3. Special requirements for job entry

In order that the National Study be better coordinated, occupational families were used as adopted by the National Center for Research in Vocational Agricultural Education at Ohio State University. The families included in this investigation were as follows:

1. Farm Machinery Sales and Service
2. Farm Supplies and Equipment
3. Livestock and Poultry
4. Crops, Forestry and Soil Conservation
5. Ornamental Horticulture
6. Wildlife and Recreation
7. Farm Service
8. Agricultural Service

Total number of employees was determined for each occupational family and the current employment having agricultural competencies, including the number of additional employees having competencies in agriculture five years hence.

Job titles were determined for each occupational family and the projection of new job titles surveyed for each occupational family. Each job title was also classified according to levels of employment; namely, professional, technical, managerial, supervisory, sales, office, skilled, semi-skilled and unskilled.

Data were collected in each occupational family and each level of employment to include: age of entry into occupation, monthly salary, and number of employees having knowledge or skill in each subject matter area, namely, crops, livestock, management and mechanics.

Categorically, education requirements were determined for each job level in each occupational family. Such requirements as education, residential background, farm experience and continuing education necessary for advancement were also ascertained.

These data were gathered with the idea of revealing occupational opportunities in nonfarm agriculture in the Monroe-West Monroe Metropolitan Area. Guidance counselors as well as school administrators will be in a better position to guide youth in the projection of vocational objectives, as a description and increasing need of jobs in nonfarm agriculture become available to them. If teachers of vocational agriculture would use these employment data, they could develop a program which would insure the type and kind of training necessary for students to gain entry and advance in jobs needed in nonfarm agriculture.

PRESENTATION AND ANALYSIS OF SURVEY INFORMATION

Occupational Families

The 108 businesses and agencies comprising the Monroe-West Monroe agricultural complex were classified according to appropriate occupational families. These organizations were fairly well distributed over all of the eight families except Ornamental Horticulture, and Wildlife and Recreation where only a limited number appeared.

A complete classification of the various kinds of firms and agencies is given by occupational family:

I. Farm Machinery Sales and Service
   - Tractor and Implement Company
   - Industrial Equipment Company
   - Truck Company
   - Equipment Company

II. Farm Supplies and Equipment
   - Lumber Company
   - Feed and Seed Company
   - Farm Supply Company
   - Department Store
   - Chemical Company
   - Wholesale Company
   - Food Store

III. Livestock and Poultry
- Dairy Products Company
- Meat and Packing Company
- Livestock Sales Barn

IV. Crops, Forestry and Soil Conservation
- Forestry Commission
- Forestry Products Company
- Grain Company
- Oil Mill Company
- Curb Market
- Cotton Company
- Pecan Company

V. Ornamental Horticulture
- Garden Center

VI. Wildlife and Recreation
- Golf Club
- Park

- U. S. Department of Agriculture
- Experiment Station
- Extension Service

In Table I the businesses or firms in the Monroe-West Monroe Metropolitan Area were categorized into eight occupational families. Farm Supplies and Equipment, and Farm Service occupational families contained nearly 50 per cent of the 108 firms included in this investigation; the greatest concentration was in Farm Service and Ornamental Horticulture.

The rank of occupational families according to number of establishments was as follows:

1. Farm Service
2. Farm Supplies and Equipment
3. Crops, Forestry and Soil Conservation
4. Agricultural Service
5. Livestock and Poultry
6. Farm Machinery Sales and Service
7. Wildlife and Recreation
8. Ornamental Horticulture

TABLE I

NUMBER OF AGRICULTURAL BUSINESSES, INDUSTRIES, AND AGENCIES BY OCCUPATIONAL FAMILY, 1964

Occupational Family	Number
Farm Machinery Sales and Service	11
Farm Supplies and Equipment	24
Livestock and Poultry	12
Crops, Forestry and Soil Conservation	17
Ornamental Horticulture	1
Wildlife and Recreation	3
Farm Service	26
Agricultural Service	14
Total	108

Number Employed in Nonfarm Agriculture

Table II reveals the number of persons employed in agricultural businesses, industries, and agencies; and the number of employees having agricultural competencies for the Monroe-West Monroe Metropolitan Area.

These data show that 4,110 employees were employed in the 108 agricultural businesses, with some 1,225 currently employed having competencies in agriculture. This latter figure represented nearly 30 per cent of the total number employed in this Metropolitan Area in agricultural businesses.

More than 50 per cent of all those currently employed were contained in Farm Supplies and Equipment; and Crops, Forestry and Soil Conservation. Less than five per cent of those actively engaged in these businesses were in Ornamental Horticulture, and Wildlife and Recreation.

Expected employment of individuals with agricultural competencies five years hence is expected to increase by some 117 employees.

The greatest increase in employment five years hence is indicated to be concentrated in Farm Supplies and Equipment, with some 45 additional employees needed with competencies in agriculture.

TABLE II

NUMBER OF PERSONS EMPLOYED IN AGRICULTURAL BUSINESSES, INDUSTRIES AND AGENCIES, AND NUMBER OF EMPLOYEES HAVING AGRICULTURAL COMPETENCIES, BY OCCUPATIONAL FAMILY

Occupational Family	Total No. Employees	Employees Having Agricultural Competencies	
		Current Employment	Expected Employment Five Years Hence
Farm Machinery Sales & Service	345	154	179
Farm Supplies & Equipment	639	247	292
Livestock & Poultry	291	101	103
Crops, Forestry & Soil Conservation	1,392	403	420
Ornamental Horticulture	2	2	2
Wildlife & Recreation	657	58	58
Farm Service	312	137	145
Agricultural Service	472	123	143
Total	4,110	1,225	1,342

Occupational families ranked according to numbers employed having agricultural competencies are as follows:

1. Crops, Forestry and Soil Conservation
2. Farm Supplies and Equipment
3. Farm Machinery Sales and Service
4. Farm Service
5. Agricultural Service
6. Livestock and Poultry
7. Wildlife and Recreation
8. Ornamental Horticulture

Only two of the eight occupational families were not expected to increase in employment five years hence, with reference to individuals having competencies in agriculture: Ornamental Horticulture, and Wildlife and Recreation.

Job Titles According to Occupational Families and Levels of Employment

The 1,225 individuals currently employed in the 108 agricultural businesses in the Metropolis of Monroe-West Monroe were found in 222 different job titles. The number of job titles five years hence is expected to increase by 39.

The data in Table III indicate that more than 45 per cent of the job titles were concentrated in two occupational families, namely, Crops, Forestry and Soil Conservation, and Farm Supplies and Equipment.

Less than five per cent of the job titles were found in Ornamental Horticulture, and Wildlife and Recreation.

The number of job titles was not expected to increase five years hence in Livestock and Poultry, Ornamental Horticulture, and Wildlife and Recreation.

TABLE III

NUMBER OF JOB TITLES IN AGRICULTURAL OCCUPATIONS OTHER THAN FARMING BY OCCUPATIONAL FAMILY

Occupational Family	Number of Job Titles	Number of Job Titles Five Years Hence
Farm Machinery Sales & Service	23	29
Farm Supplies & Equipment	44	48
Livestock & Poultry	32	32
Crops, Forestry & Soil Conservation	57	73
Ornamental Horticulture	2	2
Wildlife and Recreation	8	8
Farm Service	25	35
Agricultural Service	33	34
Total	222	261

The list to follow reveals the job titles in each of the eight occupational families, including in addition, the number of workers found in each job title.

Levels of Employment in Nonfarm Agriculture

The data in Table IV show the total employees with agricultural training by levels of employment in each occupational family.

A review of the levels of employment frequencies in all occupational families indicates at a glance their relative ranking. They are ranked according to numbers employed in each category as follows:

1. Unskilled
2. Managerial
3. Semi-Skilled
4. Sales
5. Skilled
6. Office
7. Supervisory
8. Professional
9. Technical

TABLE IV

TOTAL EMPLOYEES WITH AGRICULTURAL TRAINING
BY LEVELS OF EMPLOYMENT IN OCCUPATIONAL FAMILIES

Occupational Family	Levels of Employment									
	Prof.	Techn.	Mang.	Superv.	Sales	Office	Skilled	Semi-Skilled	Un-skilled	Total
Farm Machinery Sales & Service	0	0	39	3	39	2	54	17	0	154
Farm Supplies & Equipment	2	0	49	3	65	16	3	56	53	247
Livestock & Poultry	0	1	18	6	26	10	12	13	15	101
Crops, Forestry & Soil Conservation	10	2	61	11	26	26	21	73	173	403
Ornamental Horticulture	0	0	1	0	0	0	0	0	1	2
Wildlife & Recreation	1	0	3	5	0	0	1	7	41	58
Farm Service	0	0	39	4	13	0	28	43	10	137
Agricultural Service	19	0	38	3	0	39	3	0	21	123
Total	32	3	248	35	169	93	122	209	314	1,225

It is interesting to note that three occupational families; namely, Farm Machinery Sales and Service; Ornamental Horticulture; and Farm Service did not have workers at the professional and technical levels of employment. Ornamental Horticulture had employees only at the managerial and unskilled levels of employment.

Farm Supplies and Equipment had the greatest number in sales; Crops, Forestry and Soil Conservation, the larger numbers in managerial, supervisory, semi-skilled, and unskilled; Agricultural Service, the greatest number in the professional level of employment.

The number of individuals employed at the technical level of employment in all occupational families for the Monroe-West Monroe Metropolitan Area was statistically insignificant.

No unskilled workers were found in Farm Machinery Sales and Service.

Job Entry Age for Nonfarm Agricultural Workers

The age of the 1,225 employees having competencies in agriculture was surveyed by occupational family and level of employment. Ages were designated as: present, minimum, and maximum for job entry.

Tables V-1 through V-8 give the average age of entry into off-the-farm agricultural occupations for each level of employment and in each occupational family.

Semi-Skilled	0	0	0
Unskilled	29	25	45

The minimum average job entry age at all levels of employment was focused at 25 years; while prospective employees past the age of 45 appeared to have little opportunity to begin their employment in agricultural businesses of this Area.

Secondary school students and others less than 25 years of age would find it extremely difficult to gain entry in those occupations; however, individuals willing to prepare themselves for specific occupations could well enhance their opportunities for earlier employment in these businesses. Business representatives clearly indicated that youth less than 25 years of age usually do not possess salable skills which are of value to them in a growing, competitive business.

Educators could develop training programs in keeping with the occupational needs of the businesses allied to agriculture in this Metropolitan Area and prepare youth for job entry after completion of their formal secondary school program of studies. This would not only increase the earning capacity of individuals, but would also provide more vertical movement to the higher level of employment at an earlier age, thus increasing the years of service of an outstanding individual to a business or industry.

Salaries of Workers Employed in Nonfarm Agriculture

Median monthly salaries of employees in the agricultural business of the Monroe-West Monroe Area were calculated for each occupational family and for the nine levels of employment surveyed in this investigation. Median salaries were limited in scope to the beginning and maximum monthly salaries.

Tables VI-1 through VI-8 give these data for the 108 businesses and 1,225 workers in this study.

Unskilled	176.00	178.77

The median beginning salary for the skilled worker was more than $100.00 higher in most occupational families than the beginning salary for the unskilled individual; the unskilled worker did not make as impressive a gain in salary level with the increase of tenure on the job as did the skilled worker. Beginning salaries for the unskilled worker were more frequently under $200.00 monthly.

Managerial positions invariably revealed beginning salaries in excess of $450.00 monthly, with significant increases in salary with job tenure. Supervisory positions also commanded significant step increases as job tenure increased.

As was anticipated, the professional level of employment offered a higher beginning salary than any other level; subsequent increases in salary with years of service was also at the highest plateau.

Although this study did not reveal large numbers employed as technicians in the agricultural businesses of this area, this level of employment commanded a very attractive beginning salary whenever it appeared, with impressive salary increases as the worker stayed on the job.

Sales as a level of employment in practically all occupational families offered very attractive positions with good beginning salaries and considerable increases in salary with the accumulation of experience and years of service. Much of this increase in salary is reflected in the individual's ability to increase his sales volume and consequently, increase his total commission on sales. The salary of these workers is limited only by the individual's ability and desire for achievement.

Educational Level Desired of Persons Entering Nonfarm Agricultural Occupations

In Table VII data indicate the number of employees in each occupational family and the educational level desired for the 1,225 workers in the 108 agricultural businesses in this survey.

TABLE VII

EDUCATIONAL LEVEL DESIRED FOR PERSONS
ENTERING AGRICULTURAL OCCUPATIONS

Farm Supplies & Equipment	32	110	6	38	33	28
Livestock & Poultry	6	54	25	7	9	0
Crops, Forestry & Soil Conservation	30	266	12	41	22	32
Ornamental Horticulture	0	1	0	0	1	0
Wildlife & Recreation	0	51	2	1	2	2
Farm Service	4	71	19	24	9	10
Agricultural Service	15	35	2	12	59	0
Total	91	612	92	169	140	121

The data in this segment of the study were parallel to all other agricultural businesses and industries throughout the State in that the competent business manager or representative was not desirous of employing, in significant numbers, individuals with less than a high school education. Only seven per cent of the employees were in the less than high school category.

Business executives leaned more heavily upon the high school graduate, however, with nearly 50 per cent of the total employees possessing a high school education.

No individual with less than a high school education was desired in Ornamental Horticulture, and Wildlife and Recreation.

A preference for some college was expressed for nearly 14 per cent of the total number employed; college completion was desired for more than 11 per cent of those employed in agricultural businesses.

Only 7.5 per cent of the workers were desired to possess post-high school technical education. This statistical fact, however, must be interpreted from the standpoint that businesses did not indicate a great need, in number, for the technician in the agricultural businesses of this Area.

These data show that more than 70 per cent of the employees were required to have at least the high school graduate level or beyond. This fact should be motivating to youth in continuing their education beyond high school.

Farm Supplies and Equipment; Farm Service; and Crops, Forestry and Soil Conservation contained the largest number of employees meeting the high school graduate educational requirement for persons entering agricultural occupations. Farm Supplies and Equipment and Agricultural Service required more workers to have a college degree for job entry.

Agricultural business firms expressed a "no preference" for some 10 per cent of the employees with regard to educational level desired for employment. However, many employers were most verbose about the noticeable differences in performance, which favored the individual with the higher level of education.

Residential Background Preferred for New Employees

According to the data in Table VIII, employers expressed a preference, in the case of the farm, rural nonfarm, or urban youth, for less than 45 per cent of the 1,225 individuals employed having competencies in agriculture.

These data indicate the extent that employers express a preference for the farm, rural nonfarm, and urban reared individual as new employees if they had to replace their current work force. Data were collected for each occupational family with regard to residential background preferred for new employees.

TABLE VIII

RESIDENTIAL BACKGROUND PREFERRED FOR NEW EMPLOYEES

Occupational Family	Farm		Rural-nonfarm		Urban		No Preference	
	No.	Per Cent	No.	Per Cent	No.	Per Cent	No.	Per Cent
Farm Machinery Sales & Service	50	32	0	0	0	0	104	68
Farm Supplies & Equipment	30	12	4	2	30	12	183	74
Livestock & Poultry	54	54	1	1	2	2	44	43
Crops, Forestry & Soil Conservation	226	56	4	1	1	.25	172	42.75
Ornamental Horticulture	2	100	0	0	0	0	0	0
Wildlife & Recreation	2	3	0	0	0	0	56	97
Farm Service	27	20	4	3	1	1	105	76
Agricultural Service	65	53	44	36	0	0	14	11
Total	456		57		34		678	

Employers expressed the desire for the individual with a farm residential background for more than 37 per cent of the total number employed in the agricultural businesses of the Area being surveyed. Subsequently, employers would replace individuals with new employees having farm residential background at about the same ratio.

It is worthy of note, however, that the urban reared individual was preferred in less than three per cent of the future number to be employed in these agricultural businesses.

Farm Experience Preferred for New Employees

Data in Table IX show that more than 50 per cent of the employees having competencies in agriculture have farm experience. Nearly 37 per cent of all individuals employed, as previously stated, were required to possess competencies in agriculture to gain job entry.

The data in Table IX reveal that the noncommercial type of farm experience is somewhat more preferable for new employees; however, employers would probably select individuals from either category without a great deal of reluctance.

TABLE IX

FARM EXPERIENCE PREFERRED FOR NEW EMPLOYEES

Occupational Family	Commercial Farm		Noncommercial Farm		No Preference	
	No.	Per Cent	No.	Per Cent	No.	Per Cent
Farm Machinery Sales & Service	25	50	1	2	24	48
Farm Supplies & Equipment	13	43	13	43	4	14
Livestock & Poultry	4	7	50	93	0	0
Crops, Forestry & Soil Conservation	32	14	24	11	170	75
Ornamental Horticulture	0	0	2	100	0	0
Wildlife & Recreation	0	0	0	0	2	100
Farm Service	5	19	16	59	6	22
Agricultural Service	35	54	26	40	4	6
Total	114		132		210	

One would expect that Farm Machinery Sales and Service businesses would give preference to the commercial type of farm experience, since the familiarity with heavy equipment is almost a necessity for new employees in this type of work.

Farm Supplies and Equipment firms, however, appear to prefer the noncommercial type of farm experience with equal regularity as they prefer the commercial type.

In the Livestock and Poultry, and Ornamental Horticulture occupational families, business firms leaned overwhelmingly in favor of the noncommercial type of farm experience; Agricultural Service would draw heavily upon individuals who possess commercial farm experiences, but would also select the

noncommercial farm experienced individual without extreme prejudice.

Firms representing Crops, Forestry and Soil Conservation indicated that they would have "no preference" for farm experience with as many as 75 per cent of their new employees. It should be noted, however, that in this family of occupations, some 25 per cent with commercial and noncommercial types of farm experiences constitute a nucleus for efficient operation, although 75 per cent were not required to have these experiences.

Wildlife and Recreation gives no preference to the individual with farm experience; Farm Machinery Sales and Service firms would hire 50 per cent of their new employees without farm experience.

Agricultural Subjects With Which Prospective Workers Must Have Knowledge or Skill

Tables X-1 through X-8 indicate the agricultural subject area in each occupational family with which employees must be familiar at each level of employment.

Agriculture was divided into four general areas in order to survey the knowledge or skill needed to gain job entry, namely, 1) animal science, 2) plant science, 3) agricultural business management and marketing; and 4) agricultural mechanics and automation.

Each occupational family and the nine levels of employment structured for this study served as a basis for determining the agricultural subject areas with which the individual must be familiar to secure initial employment.

Total	123				

These data show that the greatest need for general familiarity with agricultural subjects was in the managerial, supervisory, sales, and skilled levels of employment. In the professional level of employment, there was also a need for general knowledge and skills in agricultural subjects, however, because of the few workers employed at the professional level in this study, data appear fragmentary in this regard.

A general trend exists in some levels of employment in certain occupational families for specialized training in a particular field to be more desirable, such as, Livestock and Poultry, Animal Science, and Agricultural Business Management and Marketing.

Ironically, however, managers of an agricultural business were expected to be familiar with the entire agricultural business and its ramifications.

The unskilled worker, generally, was not required to have control at the information level of the four agricultural subject areas surveyed in this study.

At the technical level of employment only a few workers were found in the eight occupational families. One would certainly surmise that those individuals in whatever capacity they performed would be trained for performance in one of the specialized agricultural subject fields.

Employees at the office level of employment, in most cases, were expected to have a concentrated knowledge of agricultural business, management, and marketing. This is obvious since most of these individuals must have daily contact with terminology and business procedures which normally occur in any business or industry.

Continuing Education Required of Employees and Educational Facilities Used

Table XI is concerned with the continuing education required of employees for each occupational family. Employees indicated that this continuing education was necessary for employees to advance in occupational status. The kinds of continuing education preferred are tabulated as firm or industry school,

on-the-job training, public school adult education, vocational school, and agricultural college.

TABLE XI

CONTINUING EDUCATION REQUIRED BY FIRMS TO ADVANCE IN OCCUPATIONS

Occupational Family	No.	Number of Firms					
		Firm or Industry School	On-the-job Training	Pub.Sch. Adult Educ.	Voc. School	Agri. School	None
Farm Machinery Sales & Service	154	117	103	5	3	3	6
Farm Supplies & Equipment	247	114	164	0	14	18	5
Livestock & Poultry	101	41	60	0	2	3	1
Crops, Forestry & Soil Conservation	403	290	196	0	5	3	80
Ornamental Horticulture	2	0	2	0	0	1	0
Wildlife & Recreation	58	10	57	0	1	0	1
Farm Service	137	108	99	4	10	16	14
Agricultural Service	123	2	39	44	0	15	21
Total	1,225						

The greatest concentration of continuing education required of employees in Farm Machinery Sales and Service; Farm Supplies and Equipment; Livestock and Poultry; Crops, Forestry and Soil Conservation; and Farm Service was at the firm or industry school and on-the-job training. The vocational school and agricultural college were statistically of some importance in Farm Supplies and Equipment, and Farm Service.

Ornamental Horticulture, and Wildlife and Recreation employers required basically on-the-job training as a continuance of education required for advancement in occupations.

Employers in Agricultural Service required on-the-job training and, to an

even greater degree, public school adult education.

Nearly 15 per cent of the employee frequencies in Crops, Forestry and Soil Conservation required no continuing education for advancement in occupational status. The implication in this case in point, however, is that most of these individuals are at the unskilled level of employment and therefore, are primarily engaged in routine duties not likely to be differentiated from time to time.

The vocational school and agricultural college were mentioned infrequently in all occupational families when compared statistically with the firm or industry school or on-the-job training.

SUMMARY, CONCLUSIONS AND RECOMMENDATIONS

Teachers of vocational agriculture, school officials, and guidance counselors are becoming increasingly aware of the important functions that agricultural courses in secondary schools can serve in preparing youth for gainful employment in agricultural occupations. Professional educators in agriculture and at all levels need to close ranks and articulate their efforts.

The total task of education in agriculture in the United States and elsewhere is increasing in scope and significance, yearly. As in all educational areas, the instruction needed should and must change with changes in technology and needs of the individual.

Presently, it appears that a more favorable climate is emerging for the development of programs in vocational agriculture to train individuals for employment in nonfarm occupations in agriculture. More people today realize that agriculture is no longer as simple as it was at the turn of the century. Scientific and technological developments have ushered in a new agricultural era of tremendous complexity. Great numbers of people are now needed to service the farmer and rancher, and a vast army of workers is required to process products from farms and deliver them to consumers.

The facts revealed by this investigation of the occupational opportunities for employment in nonfarm agriculture are a clear indication of the needs existing in preparing youth for job entry in the agricultural business of this Area.

Much can be accomplished by a closer liaison between business and education; the educational program certainly, in some dimension, has a close correlation to the needs of business and industry. In addition, the public secondary school must develop a broader type of vocational education program in agriculture; programs must be planned to open all the doors of opportunity rather than provide narrow, specialized training for single careers.

Summary

The impact of agriculture on the economy of the Monroe-West Monroe Metropolitan Area is tremendous. Considering the production phase of agriculture in the total trade Area, represented by more than 19,520 farms, averaging some 142 acres in size, one would immediately conclude that agriculture plays a most significant economic role and is a vibrant generator of employment in other businesses, even those not allied to agriculture. The potential employment capacity in agricultural occupations in this Area is almost unlimited.

The 108 agricultural businesses surveyed contained 222 different job titles and employed 1,225 individuals having competencies in agriculture. This kind of employment potential, coupled with projected growth of current and additional industries likely to locate in this kind of economic environment, merits the attention of all those concerned with the education of our youth.

More and more, management in agricultural business will be looking for and expecting individuals to begin their employment in the business without having to be completely trained; the increased competence of these individuals can then be directed in the projection of improvement in the business.

A summary of the findings in this study is as follows:

1. As a result of this investigation 108 agricultural firms were surveyed for occupational opportunities in off-farm agricultural occupations. These agricultural businesses employed 4,110 individuals; 1,225 of these workers were required to have competencies in agriculture.

2. Employers or their representatives projected an increase of 117 workers in all occupational families five years hence.

3. A total of 222 job titles were found in the 108 agricultural businesses; this number was expected to increase to 261 five years hence.

4. More than 45 per cent of the job titles were focused in two occupational families, namely, Crops, Forestry and Soil Conservation; and Farm Supplies and Equipment.

5. The number of job titles was not anticipated to increase in the next five years in Livestock and Poultry; Ornamental Horticulture; and Wildlife and Recreation.

6. The levels of employment frequencies in all occupational families according to numbers employed having agricultural competencies were ranked as follows:
    1. Unskilled
    2. Managerial
    3. Semi-skilled
    4. Sales
    5. Skilled
    6. Office
    7. Supervisory
    8. Professional
    9. Technical

7. The number of individuals employed at the technical level of employment in all occupational families was statistically insignificant.

8. The minimum average job entry age at all levels of employment was centered at 25 years; prospective employees past the age of 45 were not in demand in the agricultural business of this Area.

9. The median beginning salary for the skilled worker was more than $100.00 higher monthly than that of the unskilled worker; the unskilled worker did not make as impressive a gain in salary level with the increase of tenure on the job as the skilled worker.

10. Managerial positions commanded beginning salaries in excess of $450.00 monthly, with stimulating salary increments with longevity in employment. This fact was frequently found to be true in supervisory positions, also.

11. This study did not reveal significant numbers employed as technicians in the agricultural businesses of the Area; however, whenever this level did appear, it was represented by a very impressive beginning salary, together with encouraging salary increases with job tenure.

12. Sales positions in all occupational families offered very attractive beginning salaries and significant increases in salary with longevity in years of service on the job.

13. Business executives catered to the high school graduate in positions in nearly all occupational families in selecting persons entering agricultural occupations; almost 50 per cent of the 1,225 persons having agricultural competencies were found in this designation.

14. Twenty-five per cent of the workers with agricultural competencies were required to have some college training--11 per cent of them were college graduates.

15. More than 70 per cent of the employees having agricultural competencies were required to have an educational background at the high school graduate level or beyond.

16. Employers did not express a preference as to residential background for 55 per cent of the 1,225 individuals employed having agricultural competencies; however, it was significant that the urban reared youth was preferred in less than three per cent of the employees.

17. More than 50 per cent of the new employees having agricultural competencies were preferred to have some kind of farm experience; the noncommercial type of farm experience exhibited more frequencies in the case of new employees.

18. Employers appeared to show little discrimination between the commercial or noncommercial types of farm experience for new employees. One appeared to be selected with little reluctance over the other.

19. Nearly 50 per cent of the employers had no preference for either the commercial or noncommercial type of farm experience with future employees.

20. The greatest need for familiarity with agricultural subject was in the managerial, supervisory, sales and skilled levels of employment.

21. Managers of an agricultural business were expected to be familiar with the entire aspect of the business.

22. Employees at the clerical level of employment were expected to have a concentrated knowledge of agriculture business, management and marketing.

23. The greater concentration of continuing education required of employees in Farm Machinery Sales and Service, Farm Supplies and Equipment; Livestock and Poultry; Crops, Forestry and Soil Conservation; and Farm Service, was at the firm or industry school and on-the-job training.

24. The vocational school and agricultural college were mentioned infrequently in all occupational families when compared statistically with the firm or industry school or on-the-job training types of continuing education.

Conclusions

This study revealed the great impact of nonfarm agriculture to the total economy of the Monroe-West Monroe Metropolitan Area. By identifying the job opportunities and the knowledge and skills needed for these positions, this investigation provides a platform upon which can be launched a program for meeting the training needs of youth interested in and having aptitude for occupations in businesses supporting the agricultural complex of this Area.

It was most apparent from the interviews held with various business executives that, presently, there is much to be desired in the training possessed by individuals seeking their initial employment in businesses allied to agriculture. Basic training in agricultural businesses is essential, especially to assist the individual to firmly entrench himself in his employment responsibilities.

Today, an individual who possesses a general type of preparation is at a tremendous disadvantage in the labor market; the prospective employee must be trained in some field which indicates a concentration of knowledge and skill, especially, if that individual is objectively looking to the mastery of a particular field of endeavor.

The conclusions drawn from the data in this study should be of some value and use to administrators, teachers, and students to establish general guidelines necessary to effect a core of concentration for training individuals for nonfarm agricultural occupations. In addition, these data may be significant from the standpoint of revealing the dire need for more educational programs in agriculture in Ouachita Parish to help satisfy some of the employment needs of farm based businesses and industries in the Area.

The following are among the more pertinent conclusions drawn from the survey:

1. Nonfarm agriculture has made a tremendous impact on the total economy of this metropolitan area. The 108 businesses employed 4,110 individuals, with some 1,225 of these workers having competencies in agriculture.

2. Crops, Forestry and Soil Conservation, and Farm Supplies and Equipment occupational families contained the greatest concentration of job titles and they were not expected to increase significantly over the next five years. This is indicative of well established businesses associated with these occupational families.

3. Training for the technician in nonfarm agriculture is not presently in great demand in the industries and businesses of this Area. This conclusion is based primarily on the number of individuals employed at the technical level of employment, together with the familiarity of subject areas of technicians in the occupational families represented.

4. Employers are not willing to employ individuals until they have acquired at least a beginning knowledge of the type of work they plan to enter. Prospective employees, not specifically trained, have little opportunity for employment prior to the age of 25 or after the age of 45. Employers are looking for individuals who can render longer years of service in their respective businesses. More comprehensive training programs could lower the job entry age for those planning to enter nonfarm agricultural employment.

5. Employees are paid salaries commensurate with their training and experience; those with specific knowledges and skills command the higher salaries. The unskilled worker cannot expect to be paid salaries comparable to other workers, nor can he receive salary increments as the more competent employee.

6. The high school graduate is in great demand for most of the positions in the agricultural businesses of this Area. A better trained high school graduate in terms of knowledge and skills in agricultural occupations would be in even greater demand.

7. There are many lucrative positions in Sales in all occupational families in nonfarm agriculture. Depending on the training, experience, and desire for achievement, these positions could command salaries out of the reach of even many of the higher echelon positions.

8. The farm residential background is still being given considerable recognition by managers and firm representatives in the employment of new individuals in off-farm agricultural occupations. This kind of experience is difficult to match primarily because it involves the matter of attitudes formulated during the formative period in the development of the individual. This statement is strengthened by the fact that more than 37 per cent of the firms wanted individuals with a farm residential background.

9. Firm representatives did not have particular preference between the commercial and noncommercial farm experienced individual. The implication in this case is that either type of experience prepares the individual equally well for nonfarm agricultural occupations.

10. Continuing education is the order of the day; employees are expected to learn their jobs well and to keep pace with changes in their employment requirements. The firm or industry school and on-the-job training, for the present, are the primary sources of training for individuals employed in these agricultural businesses.

Recommendations

Today, vocational agricultural instruction at the secondary school level is concerned with preparing students to enter into the world of work with knowledge and skills in a host of new occupations allied to agriculture. Preparing individuals for these occupations will require adjustments in present programs of instruction in order that the vocational and specialized needs of youth are identified and an educational program provided to match their needs.

The data in this investigation give a "new vision" for nonfarm agriculture in the Monroe-West Monroe Metropolitan Area. The need for trained workers in the eight occupational families is reflected by the 1,225 employees currently employed having competencies in agriculture. An even greater need for trained workers in agribusiness appears apparent in the future as indicated by expressions concerning the future growth and development of present businesses and

industries in the Area.

A challenge has been extended to the secondary school program and others concerned with the preparation of youth for the world of work. Programs of instruction should be provided in quantity and quality to offer opportunities for youth to train for off-farm agricultural occupations.

On the farm there is need for well trained managers who wisely use capital and all the elements of production necessary to achieve high yields of animal and plant products. Off-the-farm there is a growing need for people to supply the goods and services for the large productive units that the economy depends upon. To assume that agriculture is a field of collapsing opportunity is to assume that the population is declining and that people will stop wearing clothes, stop eating, and lose interest in their environment. There are many opportunities for gainful employment in agriculture today and the outlook is for more of these occupational opportunities.

The following recommendations are offered as a result of the data gathered and interpreted in this investigation:

1. Guidance personnel in the secondary school should assemble all data pertinent to occupational information and counsel with students, parents, and teachers with the idea of implementing these data in planning educational programs to meet the needs of the individuals and businesses concerned.
2. The program in vocational agriculture in the secondary school should be broad in scope; thus, providing a strong, basic study of the science of agriculture and in addition, the necessary work experiences to make this knowledge functional in the life of the individual.
3. More opportunities should be provided in the secondary school program for the exploration of areas of interest in vocational programs in order that more specific programs may be planned to prepare individuals for gainful employment in nonfarm agriculture.

4. The 108 businesses employing some 1,225 individuals having competencies in agriculture are being served by only one department of vocational agriculture. The demand for replacement workers and increase in number of job titles and employees in these businesses are sufficient to justify additional sources to provide needed trained workers in off-farm agricultural occupations.

5. The general education level of the student was considered of tremendous importance by business representatives in this study. This fact was reflected by the data indicating that students needed at least a high school education to gain job entry.

   It is therefore necessary that students become familiar with the educational requirements needed to enter the work world not only in agricultural occupations but in other pursuits as well.

6. There is enough demand for employees at the present time in existing businesses in the world of work to warrant familiarizing students with the basic principles, organization, and practices involving a sound business operation.

7. The business an and educator need to cooperatively plan educational programs in terms of the needs of both the individuals and businesses. Individuals should be prepared to become gainfully employed at the completion of their secondary school programs. This would not necessarily involve great changes in curricular patterns, but basically, changes in content of courses already being offered in order to emphasize knowledge and skills identifiable with particular occupations.

8. A compilation containing a description of the various jobs found in the Monroe-West Monroe agricultural businesses would be helpful to all concerned with the education of youth. This would provide established guidelines for program planning, leading to employment in nonfarm agricultural occupations.

Connecticut

The 48 Connecticut schools and institutes supplying information for this study reported 2,736 vocational graduates in 1965. Of these, 85 percent were employed in occupations for which they were trained. Although there were 311 more graduates than in 1964, there was a 3.2 percent decrease in graduates continuing their education. Unemployment decreased from 1.6 percent in 1964 to 1.2 percent in 1965. The 1,732 who were employed in their field would earn a gross income of $7,061,918. Tables of data are shown for male and female graduates by schools, programs, occupations, and towns. For each classification, data show the number of courses offered, graduates in 1965, those who continued training in full-time school, those who entered the armed services, those available for employment, the mean hourly wage earned, the number employed in occupations not related to trade, the unemployed, and those not accounted for. A table and graphs show total graduates, numbers employed at trade, and numbers continuing full-time education since 1956. (EM)

FOREWORD

This year's Graduate Follow-Up Report has been expanded to show not only the placement data for Trade and Industrial graduates, but also to provide a more complete picture of graduate placement for other vocational programs administered by the Division of Vocational Education.

As a result, the 1965 report provides a breakdown of placement data by courses and by training institutions for each of the vocational programs having graduates in 1965. These areas include Distributive Education, Technical Institutes and Vocational Agriculture.

Present plans call for continued expansion of this report to include all new vocational programs as they develop. It is hoped that, in due time, we may be able to provide every vocational educator in the State with a complete report and an analysis of what becomes of the graduates of all vocational courses.

This is the first year that data processing techniques have been used to compile the Graduate Follow-Up Report. The Research Coordinating Unit has worked diligently to adapt reporting procedures for data processing and have already planned several further refinements for next year's report.

We hope that the information contained in this booklet will be of continued assistance in assessing the value of vocational programs.

Joseph F. Murphy
Director
Division of Vocational Education

ACKNOWLEDGEMENTS

This report represents the culmination of the efforts of teachers, counselors, and administrators in forty-eight schools and institutes which reported vocational graduates last year. These individuals deserve much credit for the many hours they spent attempting to reach the 2,736 graduates reported herein.

Our sincere appreciation is extended to Dr. Maurice Ross, Chief of the Bureau of Research, Statistics and Finance and to Mr. Herbert Hill of his staff who arranged for the key-punching of data cards. Special thanks is due Mr. Evan Confrey for his invaluable assistance in the programming and computer phases of the study.

We would like to thank Dr. Herbert Righthand and Mr. Errol J. Terrell for lending us helpful advice based on their experience with past follow-up studies.

Lastly, our thanks goes out to the clerks, typists, and all others who assisted in any way in the preparation of this report.

The Research Coordinating Unit

Robert E. Bennett

INTRODUCTION

	1964	1965
Total Number of Courses	188	195
Total Number of Graduates	2425	2736
Continued Training - Full-time School	384	346
Percent Continued Training	15.8	12.6
Entered Armed Service	233	279
Percent Entered Armed Service	9.6	10.2
Other	52	66
Available for Employment	1756	2045
Number Employed in Occupation for Which Trained	1490	1732
Percent	85	85
Mean Hourly Wage	1.93	1.96
Employed in Occupation Not Related to Training	189	228
Unemployed	35	19
Percent Unemployed	1.6	1.2
Unaccounted For	42	50

The 2736 vocational graduates reported in 1965 completed programs in Distributive Education, Vocational Agriculture, and Vocational-Technical courses on the secondary school level and Technical Institute courses on the post-secondary level. All of these programs are supervised by the Division of Vocational Education, Connecticut State Department of Education.

Eighty-five percent of these graduates were employed in occupations in which they used the specialized training gained in their vocational courses. This is the same placement percentage as reported last year for the 1964 graduates.

The most significant difference appears in the figures indicating those graduates who continued full-time schooling. Despite an increase of 311 in the total number of graduates, there was a decrease of 38 or 3.2% of the total continuing their education. This might be attributed to the increased military activity during the year and may be partially reflected in the .6% increase in graduates entering military service.

Another noticeable difference was the decrease in the unemployment rate from a very low 1.6% in 1964 to a lower 1.2% in 1965. We can attribute this to the fact that the 1965 graduates entered a labor market in which unemployment was at its lowest point in several years and in which employment opportunities for skilled workers were quite abundant.

The 1732 graduates who were employed in their field of training will earn a gross income of $7,061,918.

Richard C. Wilson
Chief Investigator

EDRS Price MF-$0.18 HC-$3.76 94p.

*VOCATIONAL AGRICULTURE, *OFF FARM AGRICULTURAL OCCUPATIONS, EMPLOYMENT OPPORTUNITIES, *AGRICULTURAL SKILLS, EMPLOYMENT TRENDS, OCCUPATIONAL SURVEYS, EMPLOYMENT STATISTICS, SALARIES, EDUCATIONAL NEEDS, AGE, RESIDENCE REQUIREMENTS,

As a result of two conferences held in 1963-64, interview-type surveys of employment needs in off-farm agricultural businesses were conducted in 26 states in 1964. The analysis of the findings resulted in this synthesis. Information is given on -- (1) numbers of people employed, (2) present number, estimated increase, occupational group and level of employment of workers needing agricultural competencies, (3) occupational titles, (4) groups of agricultural competencies, and (5) salaries, educational and age requirements, and background preferred. Brief summaries of the state studies are given. Findings were -- (1) Almost half of those employed needed education in agriculture with a 20 percent increase expected in five years, (2) The greatest need for agriculturally trained employees will be in agricultural supplies sales and services, agricultural machinery sales and services, ornamental horticulture services, and livestock and crop food products marketing and distribution, (3) Competency needs are determined by the products handled by the business, (4) Subjects taught to students preparing for production farming are also needed, (5) Vocational agriculture may support or be supported by other vocational subjects in many instances, (6) Salesmanship, human relations, and business management are competencies needed by all employees, and (7) Beginning salaries and wages for service workers are relatively low. Publications on Off-Farm Agricultural Occupations
Available From
The Center for Research and Leadership Development
in Vocational and Technical Education
The Ohio State University
980 Kinnear Road
Columbus, Ohio, 43212

This publication is one of a series relating to Off-Farm Agricultural Occupations developed at the Center for Vocational and Technical Education under a grant from the Division of Adult and Vocational Research, U. S. Office of Education. Each of these publications was designed for a specific purpose. However, they are designed to complement and reinforce each other. It is suggested that persons using any of these materials will want to familiarize themselves with the other publications in this series. Following is a complete listing of this series.

1. Policy and Administrative Decisions in Introducing Vocational and Technical Education in Agriculture for Off-Farm Occupations

2. Vocational and Technical Education in Agriculture for Off-Farm Occupations

3. Summary of Research Findings in Off-Farm Agricultural Occupations

4. Planning and Conducting Cooperative Occupational Experience for Off-Farm Agriculture

5. Occupational Guidance for Off-Farm Agriculture

6. Horticulture - Service Occupations
(Course outline and twelve modules)

7. Agricultural Supply - Sales and Service Occupations
(Course outline and twelve modules)

8. Agricultural Machinery - Service Occupations
(Course outline and sixteen modules)

9. Agricultural Chemical Technology
(Course outline and nine modules)

PREFACE

Tremendous shifts have taken place in the agricultural industry in recent years. A broad complex of off-farm agricultural businesses and services has evolved to facilitate the work of the production farmer and rancher. Agricultural educators and others are becoming increasingly aware that agriculture and farming are no longer synonymous. These have been reflected in recent developments in vocational and technical education. The President's Panel of Consultants on Vocational Education in their summary report recommended that:

> The vocational agriculture program, under Federal reimbursement, should be broadened to include instruction and increased emphasis on management, finance, farm mechanization, conservation, forestry, transportation, processing, marketing the products of the farm, and other similar topics.

This recommendation was implemented in PL 88-210. The Act specifically states in Sec. 10 B:

> Any amounts allotted (or apportioned) under such titles, Act, or Acts for agriculture may be used for vocational education in any occupation involving knowledge and skills in agricultural subjects, whether or not such occupation involves work of the farm or of the farm home, and such education may be provided without directed or supervised practice on a farm.

In recognition of this need and in anticipation of this broadened responsibility for vocational agriculture, two National Research Coordination Conferences on Off-Farm Agricultural Occupations were sponsored by The National Center for Advanced Study and Research in Agricultural Education located at The Ohio State University in cooperation with the Office of Education. These conferences were held in May of 1963 and January of 1964 and involved representatives of 23 states. The broad purpose of these meetings was to stimulate research needed to provide data on employment opportunities and projections, training needs, and other similar information essential to intelligently planning vocational education programs for off-farm agricultural occupations. The conferences

also provided a means of encouraging commonality and coordination among state studies, sharing materials, and encouraging comparable studies. These meetings also served as a "clearing house" whereby representative states could share experiences and benefit from the progress and developments in other states.

Dr. Roy M. Kottman, Dean of the College of Agriculture and Home Economics, The Ohio State University, provided funds to begin work on coordinating and summarizing these state efforts prior to the grant from the Office of Education.

This publication, developed under the leadership of Dr. Glenn Z. Stevens, of the Department of Agricultural Education, Pennsylvania State University, and associate project leader, is a synthesis of state studies completed in the area. As noted, a considerable portion of the research is not yet completed, but sufficient data had been accumulated to merit this synthesis as a basis for developing program and instructional materials in off-farm agricultural occupations, and for refining and redirecting future research efforts.

We would like to acknowledge the support and assistance that we have received from representatives in economics, sociology, and other areas of vocational education in reviewing and interpreting these data. Other task force members working with Dr. Stevens on this publication include William W. Stevenson, Oklahoma State University; Homer V. Judge, University of Massachusetts: and Don F. Seaman, Graduate assistant in agricultural education, The Ohio State University, and Leonard Giambra, Graduate Assistant in Pschyology at Ohio State University. Recognition and thanks also are due the many state staff members and state project research directors for their cooperation and assistance in this and other phases of the Task Force effort.

We encourage readers to contact individual researchers in the states for further information, understandings, and implications of the independent state studies.

ROBERT E. TAYLOR, Director
The Center for Research and Leadership
Development in Vocational and
Technical Education

DIGEST

A summarization has been made of the findings of predominantly interview-type surveys of employment needs in off-farm agricultural businesses in 26 states. Nearly all of these surveys were conducted in 1964. There was considerable variation in the way the states conducted the studies and reported the findings. Much of the research is still in progress and additional state publications will be issued.

The report is divided into four sections. The first deals with numbers of people employed, numbers needing agricultural competencies, and expected numbers of new workers to be hired in the next five years. The second section analyzes the competencies needed by persons in the different characteristics such as age, education, background, and salary. The fourth section is a brief summary of the results of each state survey.

Generalizations that may be drawn from the findings are:

1. Almost half the people employed in off-farm agricultural businesses need education or training in agriculture.
2. Employers expect about a twenty per cent increase in the number of employees needing agricultural competencies in the next five years. This parallels the anticipated expansion in the total labor force.
3. Need for greatest numbers of agriculturally-trained employees will be in agricultural supplies sales and services, agricultural machinery sales and services, ornamental horticulture services, and livestock and crop food products marketing and distribution.
4. Agricultural competencies needed are mainly determined by the products handled by the business.

5. Many of the agricultural subjects taught to students preparing for production farming also will be needed by students who enter off-farm agricultural occupations.

6. There are many instances in which vocational agriculture may support, or be supported by, other vocational subjects taught.

7. Salesmanship, human relations, and business management are competencies needed by all employees, but in varying degrees.

8. Industrial competency needs generally are low for most fields of activity in agricultural businesses.

9. Beginning salaries and wages for service workers are relatively low. Effective training programs should make it possible for new employees to earn higher incomes.

10. To continue in a vocational-technical education program beyond the twelfth grade is appropriate for many persons, since most employers consider twenty years to be a minimum entry age.

11. Trainees with a farm background or farm experience have a definite advantage when seeking employment in off-farm agricultural businesses.

12. Occupational titles needing the greatest number of new employees, not including professional workers, in the next five years are:

Agricultural Machinery Mechanic	Greenhouse Grower
Agricultural Machinery Mechanic's Helper	Greenhouse Worker
Agricultural Machinery Set-up Man	Nursery Worker
Agricultural Machinery Salesman	Greenskeeper
Agricultural Machinery Partsman	Groundskeeper
Agricultural Supplies Salesman	Food Products Processman
Agricultural Supplies Serviceman	Food Products Salesman
Agricultural Supplies Deliveryman	Food Products Department Manager

Research in this area is just beginning to provide direction to curriculum planning. Much more is needed as vocational education in agriculture continues to serve the needs of students and the industry.

SUMMARY OF RESEARCH FINDINGS IN OFF-FARM AGRICULTURAL OCCUPATIONS

Introduction

Persons employed in many industries, businesses, services and agencies need competencies in agriculture. Most off-farm agricultural occupations are known in all states by the same or similar titles. Combinations of several functions and activities increase the numbers of occupational titles.

The demand for workers with agricultural occupations is based upon and proportional to the production farming outputs in a state or region. Changes in numbers employed and in the responsibilities of the workers in various occupational fields of activity closely follow technological advances. Production inputs, the products and services that modern specialized farmers must purchase, are influenced by research in agricultural science. Processing and distribution developments both cause and respond to changes in consumer preferences and result in new or changed knowledge and skill requirements of specific workers.

It was a growing awareness of urgent need for more definite information on requirements for occupational education involving competencies in agriculture that brought state leaders in agricultural education together at planning conferences at The Ohio State University in May, 1963, and January, 1964. The combined effort of the participants accounts for the considerable similarity in objectives and in data collection procedures that characterizes the individual state reports that have been issued. It was intended that the common purposes and design of the surveys would make feasible a summary publication from the cooperative project.

Objectives of the State Studies

In recognition of the need to change programs of vocational education in agriculture to prepare persons for employment in off-farm agriculture, as well as for farming and ranching, and in anticipation of new legislation, state leaders in agricultural education gave careful consideration to designing state studies. The plans for surveys to be made in 1964 were oriented to achieving the following basic objectives:

1. To identify present and emerging off-farm occupations needing agricultural competencies, and for which vocational and technical education in agriculture should be available.
2. To determine present and anticipated numbers of employees in each occupation, using classifications by industry, by function, and by field of activity designations.
3. To estimate annual entry opportunities for full-time and part-time workers.
4. To determine competencies in agriculture and in related business, distribution, and industrial fields needed for job entry and for advancement.
5. To cluster occupations with common educational needs in categories that will facilitate efficient curricular and course organization in schools.
6. To obtain information on other worker traits that will be of aid in selection, guidance, and placement of individuals in order that their persistence, advancement, productivity, and satisfaction may reach maximum potential.

General Statement of Procedure

In the absence of a census or other source of lists of all employed persons in whose occupations agricultural competencies are needed, leaders of the survey projects in most states turned to available listings of all businesses, industries, agencies, and services. The Department of Labor, and the Bureau of Employment Security, in each state was able to furnish this information.

The second step, in most states, was to assemble committees of persons who could with high reliability sort out the firms that were likely to have employees that use agricultural competencies in their work. The organization without likelihood of having such employees were not visited. Yellow pages of telephone directories were the starting point in some states.

The next consideration was to draw a random sample of the businesses. This was done in a stratified manner in some states, meaning that the randomization was within parts of each total list of firms. Varying sample percentages, ten per cent to seldom more than fifty per cent, were used.

Interview data schedules were prepared and pre-tested. Interviewer's manuals were written in most states and used to train both paid and unpaid interviewers. The unpaid interviewers usually were teacher volunteers who lived in the geographic areas, often school districts, that were being surveyed. Reports of failure to effect successful interviews with the manager or personnel director in each business were nearly nonexistent. Cooperation and interest on the part of employers were excellent. Most states tabulated numbers of employees by each of several classifications. Only a few states have as yet processed the data on knowledge, skills, and abilities needed by employees.

Present Number and Estimated Increase in Workers Needing Agricultural Competencies

Data from typical states which conducted research on a state-wide or area basis are used in Table 1 to illustrate the number and percentage of workers in off-farm businesses, industries, and agencies who need agricultural competencies. The findings show that almost half of all workers in these types of businesses need some knowledge or skills in agriculture. This was determined, in most cases, by asking the employer if each occupational title carried with it the need for agricultural competencies.

It must be kept in mind that the data from most of the states do not include all of the professional agricultural workers who are employed by state and federal agencies. The state studies represented in Table 1 and 2 cover only the most readily recognized agricultural businesses in the state. A more exhaustive search on both the state and local levels would uncover additional employment situations in which agricultural knowledge is used.

The estimated percentage increase in the next five years in numbers of workers needing agricultural competencies as shown in Table 2 indicates that the median is about 20 per cent. This may be divided by five to represent an advance in numbers of 4 per cent per year. Reference to data in the individual state abstracts on pages 32 to 83 will give the reader more detailed information. Several reports include data on the total numbers of replacements as well as added new positions. Hiring of replacement workers is largest in businesses that have the most part-time employees.

Table 1

NUMBER AND PER CENT OF EMPLOYEES IN OFF-FARM AGRICULTURAL BUSINESS IN SELECTED STATES IN 1964 WHO NEED AGRICULTURAL COMPETENCIES[1]

State	No. Off-Farm Agricultural Businesses	Total No. of Persons Employed	Number Needing Agricultural Competencies	Per Cent Needing Agricultural Competencies
Alabama 20 counties	5,443	16,983	4,204	25

Industry and Employment Level Distribution of Workers by States

The distribution by major occupational group of employees needing agricultural competencies is given in Tables 3 and 4 for selected states, or designated part of each state. The figures in Table 3 are for states in which interviewing was done only at the local community level. The states in Table 4 also obtained figures for state level businesses, agencies of government and other centralized organizations.

The figures in Table 3 and 4 are percentage distributions of the total numbers of persons who were found to need agricultural competencies. There is a general similarity from state to state within each occupational group.

Agricultural Machinery workers form a larger percentage of the total in the states most predominantly known as commercial crop producing areas. The Agricultural Supplies figures are large primarily in farming states. Large number of employees in Ornamental Horticulture were found in states with greater urban populations. Livestock and Poultry industries, which perhaps should be known as Food Products (Meat, Milk, Poultry) businesses revealed the largest employment in concentrated, one-product areas.

It may be that the nature of the sampling, particularly in reference to whether certain types of businesses, such as greenhouses, supermarkets, hardware stores, lumber yards, were or were not included in the interviews has greatly influenced the distribution of employment opportunities by occupational group.

Table 5 was constructed on the basis of the "Level of Employment" concept. It shows, for instance, a uniformity in percentage of sales employees by states.

Table 3

DISTRIBUTION OF WORKERS NEEDING AGRICULTURAL COMPETENCIES BY OCCUPATIONAL GROUPS[1]
Data from Surveys in Selected States in 1964

Occupational Group	Colorado State Total	Massachusetts State Total	Missouri 220 School Districts	Montana 10 Communities	New York 16 School Districts	Oklahoma State Total
	Per Cent Distribution of Workers Listed by Employers as Needing Agricultural Competencies					
Agricultural Machinery	6%	15%	15%	8%	9%	20%
Agricultural Supplies	5	18	38	20	21	22
Livestock and Poultry Industries	50	18	24	36	9	19
Crops, Forestry Industries	12	12	13	7	32	13
Ornamental Horticulture	12	21	3	12	6	21
Recreation and Wildlife Services	1	4	0	0	4	0
Agricultural Services	14	12	7	17	19	5

[1]Figures are totals of full-time and part-time employees in businesses, industries, and agencies other than production farming or ranching. State-level professional, education, research, regulatory, and commercial organization employees were not included.

Table 4

DISTRIBUTION OF WORKERS NEEDING AGRICULTURAL COMPETENCIES BY OCCUPATIONAL GROUPS[1]
Data from Surveys in Selected States in 1964

Occupational Group	Alabama Twenty Counties	Delaware State Total	Louisiana Seven Cities	Pennsylvania Seventeen Counties	Utah Two Counties	West Virginia State Total
	Per Cent Distribution of Workers Listed by Employers as Needing Agricultural Competencies

Development of Lists of Current Occupational Titles

The interviewers and the state project leaders reported much greater difficulty in classifying individual job titles within industry function groups than among occupational groups. The lists which follow on the next three pages are for the Agricultural Machinery, Agricultural Supplies, and Ornamental Horticulture businesses. They are industry areas that employ large numbers of workers.

The attempt to provide uniformity in the lists is desirable but must not be carried beyond the point of essential individualization. For example, there are production phases customarily associated with nursery and floral businesses and with landscape and garden center establishments.

The term "Manager" is used over a wide range of degrees of management responsibility. Close examination of the activities performed by a worker in a position with a particular title including the word "Manager" needs to be made before deciding whether the occupation of the worker might better be classified as another type of responsibility.

Continuous work on comparing the competency ratings of occupations that seem not to be different may be aided by consultation with systems and personnel leaders in the larger businesses. It is quite possible that, for good reasons, they are striving either to have two occupational titles become more divergent or to merge into one.

More detailed information on which occupations employ the most workers, and will have the largest increases in the next five years, may be found in the abstracts of individual state studies that form another section of this report.

Occupational Titles in AGRICULTURAL SUPPLIES
by Field of Activity
(with related titles used in some businesses or states)

Field of Activity	Occupational Titles	Related Titles and Other Designations
Managerial	Agricultural Supplies Manager	
	Ag. Supplies Department Manager	Ag. Supplies Product Manager Ag. Supplies Sales Manager Ag. Supplies Service Manager Ag. Supplies Office Manager
Professional	Ag. Supplies Research and Development Director	Agronomist Nutritionist Entomologist Pathologist
Technical	Ag. Supplies Fieldman	Feed Specialist Seed Specialist Fertilizer Specialist Chemicals Specialist Petroleum Specialist Equipment Specialist
Clerical	Ag. Supplies Bookkeeper	Ag. Supplies Office Clerk
	Ag. Supplies Secretary	
Sales	Ag. Supplies Salesman	Ag. Supplies Sales Supervisor Ag. Supplies Product Salesman
	Ag. Supplies Sales Clerk	
Service	Ag. Supplies Serviceman	Ag. Supplies Service Supervisor Ag. Supplies Service Mechanic Ag. Supplies Applicator
	Ag. Supplies Equipment Operator	Ag. Supplies Mill Operator
	Ag. Supplies Worker	Ag. Supplies Warehouseman Ag. Supplies Maintenance Worker
	Ag. Supplies Deliveryman	Ag. Supplies Truck Driver

Occupational Titles in AGRICULTURAL MACHINERY
by Field of Activity
(with related titles used in some businesses or states)

Field of Activity	Occupational Titles	Related Titles and Other Designations
Managerial	Agricultural Machinery Branch Manager	
	Ag. Machinery Manager	Ag. Machinery Dealer
	Ag. Machinery Department Manager	Ag. Machinery Sales Manager Ag. Machinery Service Manager Ag. Machinery Parts Manager Ag. Machinery Office Manager

	Floral Designer	
Clerical	Orn. Hort. Bookkeeper Orn. Hort. Secretary	Orn. Hort. Office Manager Orn. Hort. Office Clerk
Production	Nursery Grower Nursery Worker	Orn. Hort. Propagator
	Greenhouse Grower Greenhouse Worker	
Sales	Orn. Hort. Salesman	Nursery Salesman Orn. Hort. Supplies Salesman Garden Center Salesman
	Orn. Hort Sales Clerk	
Service	Arborist	Tree Surgeon Tree Pruner Tree Sprayer
	Landscape Worker	
	Groundskeeper	Asst. Groundskeeper
	Greenskeeper	Asst. Greenskeeper
	Garden Center Worker	Garden Center Mechanic
	Orn. Hort. Deliveryman	Orn. Hort. Truck Driver

Grouping of Competencies and Job Titles

At the time each employer interviewed furnished the information about numbers of present and future employees in each job title in the business, a checklist of competencies (knowledge, skills, and abilities) was filled out separately for each job title. For each item on the checklist (a total of about sixty to eighty items), the employer marked the degree of competency required, from None to High, on a three to five point scale.

A representative profile of the degree of competency needed in each knowledge or job activity was made for each occupation by determining the mode (or calculating the mean to the nearest whole number value). A factor analysis program with varimax rotation was used to determine correlations between competencies as well as between job titles. "Factors" which emerge, as illustrated on the following pages with data from the Oklahoma study, are groupings of competencies or job titles with high "factor loadings."

The groupings of the job titles divided the workers both by type of business and by field of activity. The type of business groups were further divided into one cluster which included sales and management and another which indicated service workers. The mean ratings in Table 6 were calculated for each competency group in relation to the job title groups.

In general, it was found that the management category had higher competency requirements than the service group. One significant exception to this rule is in the competency area of agricultural machinery and power where the needs of service workers exceed those of management. In reading down the list of the fields of activity in Table 7, it may be seen that the competency ratings drop in most instances.

COMPETENCY FACTOR GROUPS[1]

Employee Traits--Human Relations

Inventory, stock control, warehousing
Worker welfare (insurance, retirement, etc.)
Job opportunities and trends
Job applications, interviews
Buying and merchandising
Receiving, marking, shipping
Internal business organizations
Capital management, financing
Accounting, taxes
Experience in management decisions and problem solving
Employee-supervisor relations
Supervision
Employee relations with fellow employees

Salesmanship

Salesmanship
Customer relations
Public speech
Window and store display
Mathematics
Bookkeeping, business mathematics
Buying and merchandising

Business Management

Legal relations in business management
Government regulations (ICC, FICA, etc.)
Writing
Agricultural policy
Legal requirements of the job
Surveying
Trade relationships, promotion, advertising
Experience in management decisions and problem solving
Time study
Public speech
Accounting, taxes

Agricultural Business Management

Agricultural budgeting, records, and analysis
Farm financing (credit, taxes, etc.)
Accounting, taxes
Bookkeeping, business mathematics
Capital management, financing
Agricultural labor management

[1]From factor analysis of 60 competencies, 100 job titles, Oklahoma interviews with 700 businesses.

Plant and Soil Science

Physical characteristics of soil
Chemical characteristics of soil
Additional plant production practices
Plant growth, fertilization
Soil conservation
Plant propagation, seed production
Controlling insects, diseases, weeds

Animal Science

Animal growth, feeding
Animal breeding, selection
Animal housing and equipment
Animal health and sanitation
Agricultural marketing practices

Agricultural Machinery and Power

Safety skills
Sheet metal skills
Farm power and machinery
Welding skills
Manuals, technical and service, use of
Engines, repair and maintenance

Building Construction Technology

Carpentry and cabinet working
Plumbing
Blueprint reading
Heating and ventilation
Electricity
Masonry
Drafting and design
Farm buildings and conveniences
Farm construction and maintenance
Sheet metal skills
Rural electrification and processing
Soil structures (ditches, ponds, etc.)
Agricultural labor management
Tool and die making
Trade relationships
Electronics
Industrial chemistry

Table 6

AVERAGE COMPETENCY RATING FOR EMPLOYEES IN TWO FIELDS OF ACTIVITY IN FOUR KINDS OF AGRICULTURAL BUSINESS

Competency Group (Subject Matter) Average Ratings

Type of Business and Field of Activity	Employee Traits, Human Relations	Sales-manship	Business Manage-ment	Agricultur-al Business Management	Plant and Soil Science	Animal Science	Agricultur-al Machinery and Power	Building Construction Technology

Building Construction Technology	1.3	1.3	1.1	1.1	1.1

Competency Rating Scale: High-3, Some-2, None-1
(Oklahoma Data)

The agricultural competencies needed by employees in off-farm occupations fall into four groups--plant and soil science, animal science, agricultural power and machinery, and agricultural business management. The need for these competencies to be developed in future employees ranged from low to high in the estimation of the employers. The four competency groups represent subjects that have been traditionally taught in vocational agriculture to young men going into production agriculture. The subjects might be taught in the first two or three years of vocational agriculture in preparation for a more intensive twelfth grade educational program including on-the-job experience in a selected off-farm agricultural business. The following tabulation illustrates the relative importance which managers in Oklahoma placed on competency in the four areas of agriculture:

	Agricultural Competency Needed			
Type of Business	Agricultural Business Management	Plant and Soil Science	Animal Science	Agricultural Machinery and Power
Agricultural Supplies:				
Management and Sales	high	high	high	low
Service	some	high	low	high
Agricultural Machinery:				
Management and Sales	high	high	some	high
Service	low	high	some	high
Ornamental Horticulture:				
Management and Sales	high	high	low	some
Service	low	high	low	high
Meat, Milk, and Eggs:				
Management and Sales	high	low	high	low
Service	low	low	high	some

Role of Vocational Agriculture in Supporting Education in Off-Farm Agricultural Occupations

The survey studies in off-farm agricultural occupations have brought out many instances in which vocational agriculture may support, or be supported by, other vocational subjects taught in the comprehensive high school. More of this type of supporting education must be included in curriculum planning if vocational education is to be effective in preparing youth for the complex world of work. One example of this need for supporting education is found in the area of clerical workers in off-farm agricultural business. Many of the students taking business education in high school will go into jobs in off-farm agricultural businesses. Managers were asked to rate the agricultural competencies needed for bookkeepers seeking employment with them. The following tabulation of Oklahoma data shows the results of the average ratings grouped by agriculture courses which might be taught as a supporting program to business training:

Type of Business	Agricultural Competency Needed by Clerical Workers			
	Plant and Soil Science	Animal Science	Agricultural Management	Agricultural Machinery
Agricultural Supplies	high	some	high	low
Agricultural Machinery	some	low	high	low
Ornamental Horticulture	high	low	low	low
Meat, Milk, and Eggs	low	some	some	low

There is a demonstrated need for some agricultural knowledge for beginning clerical workers. From the tabulation it may be concluded that most of the instruction would be in the area of agricultural management and plant and soil science.

Characteristics of Workers in Off-Farm Agricultural Occupations

Survey studies in the various states concerning employment in off-farm agricultural occupations also investigated certain worker characteristics. Many of the states in interviewing employers asked for information concerning such worker characteristics as minimum and maximum salary levels, minimum educational requirements, minimum and maximum age for job entry, and residential background preference. The breadth and depth of the interviews as they were conducted should give a comprehensive view of the conditions and requirements of many of the job titles in off-farm agricultural businesses.

Minimum and maximum salaries and wages. As would be expected, Table 8 shows that there was considerable variation in salaries for various levels of employment among the different states. As a matter of fact, there was less difference among types of business than there was within businesses. For this reason the wages earned are specified by level of employment and by states rather than by type of business. Generally, the professional and managerial levels of employment commanded higher pay, sales and technical levels occupied the middle area, and the service and clerical categories received relatively less. While beginning earnings were low in some of the job titles and in some of the states, average maximum salaries were acceptable in most instances. Many of the businesses have had to take beginning employees with practically no training, thus depressing wages in these areas. Effective education and training programs could improve this situation to a marked degree.

Table 8

AVERAGE BEGINNING AND MAXIMUM MONTHLY SALARY IN OFF-FARM AGRICULTURAL BUSINESSES IN SELECTED STATES BY FIELD OF ACTIVITY

Field of Activity	Average Beginning Monthly Salary						
	Ariz.	Colo.	La.	Mich.	Miss.	Okla.	Range

Service	574	360	350	464	290	362	290-574

Minimum educational requirements. Information supplied by fifteen states indicate in Table 9 that about fifty per cent of the jobs available in off-farm agricultural businesses can be filled by people with a high school education. Another ten per cent require a minimum of less than high school graduation. This raises a question when compared with the minimum age requirements as specified by the employers interviewed. In most cases, employers were unwilling to hire employees under about twenty years of age. This condition leaves a gap of two or three years which must be filled before the high school graduate can go to work. Additional education beyond high school seems to be logical in order to fill this gap. On the other hand, a more thorough training program on the high school level might lower the age minimum considerably.

Another consideration which the information naturally raises is the relatively low percentage of jobs requiring technical and/or college training (12 and 9 per cent, respectively). This would seem to indicate that employers simply have not had much experience with beginning employees trained in these ways. In states that have been providing technical training above the high school level, the per cent of employers requiring this type of experience was greater. The nation will for some time continue to be faced with the prospect of high school graduates who will be seeking immediate employment, and with employers who are willing to hire them provided their general preparation has been sufficient to meet job entrance requirements.

Minimum age to enter employment. It is logical to consider entry age by level of employment rather than by type of business. As would be expected, Table 10 shows that entry age advances as the training and responsibility associated with the job is increased. Entry into the

Table 9

PER CENT OF EMPLOYEES BY MINIMUM EDUCATION REQUIRED TO ENTER OFF-FARM AGRICULTURAL BUSINESSES IN SELECTED STATES

State	Per Cent of Employees by Minimum Education					
	Less than High School Graduate	High School Graduate	Post High School Tech. Ed.	Some College	College Degree	No Preference

Table 10

MINIMUM AGE RANGE TO ENTER DIFFERENT LEVELS OF EMPLOYMENT IN OFF-FARM AGRICULTURAL OCCUPATIONS IN SEVERAL STATES

Level of Employment	Minimum Age Range Among Occupations			
	Michigan	Montana	Oklahoma	Louisiana
Professional	29-31	30-40	25-30	25
Technical	21-29	22-30	21-30	25
Managerial	25-35	25-35	20-40	28
Sales	21-28	20-27	18-32	16
Clerical	20-23	20-25	18-30	25
Skilled	17-36	25-35	18-40	27
Semi-skilled	20-30	28-25	16-30	25

service (skilled and semi-skilled) and clerical positions is at about twenty years of age, although in a few instances entry at sixteen to eighteen was possible. Sales and technical workers may enter in their early twenties, while the minimum age for managers and professional workers is mostly from twenty-five to thirty years of age.

Residential background preference. In twelve state surveys employer preferences for rural or urban residential background of new employees were recorded and reported. The data in Table 11 shows that the range among states was from thirty-eight to ninety-two per cent. Half of the states were within five per cent of the median of 63 per cent. Farm experience was considered to be an important asset and a definite advantage to beginning workers seeking employment in off-farm agricultural occupations.

Several reasons were given by employers for their preference for young men with farm experience. The farm youth has a store of marketable knowledge which educators and counselors might take for granted but which an employer values greatly. To the employers interviewed, another advantage of a farm background is that a young man with this background has learned to work. Through experience, business managers have learned that rural youth can and will work hard. They are punctual, have orderly work habits, and accept responsibility. Young men with a farm background know how to talk farmers' language. They respect farmers and are sympathetic to farm problems. For these reasons the owners and managers of businesses which deal with farmers and farm products are looking for men with a farm background.

It is significant to note that few off-farm agricultural business employers stated definite preference for workers with an urban background. Table 11 indicates that many employers had no preference as to residential background of new employees.

Table 11

PER CENT DISTRIBUTION OF EMPLOYEE RESIDENTIAL BACKGROUND PREFERENCE AS STATED BY MANAGERS OF OFF-FARM AGRICULTURAL BUSINESSES IN SELECTED STATES

State	Residential Background			
	Farm	Rural Non-Farm	Urban	No Preference

Oklahoma	78	4	--	18
Pennsylvania	58	14	1	27

Conclusions and Implications

Vocational educators in agriculture have obtained valuable experience through conducting state surveys of off-farm occupations. New educational programs will be initiated with confidence resulting from participation in and interpretation of the findings of the surveys of competencies needed by workers. Pilot programs will test promising alternatives in organization of the teaching-learning process. Citizens, industries, schools, and related agencies are aware of the potential contribution to the total effort in education for employment that can be made in the broad range of off-farm occupations needing competencies in agriculture.

In general the Agricultural Machinery, Agricultural Supplies, and Ornamental Horticulture industries show probability of hiring the largest numbers of persons needing knowledge in agriculture in the next five years. A large field which may soon require the greatest numbers of employees is that of Food Products Marketing and Distribution. The state studies in 1964 located many jobs in the marketing and distribution of Meat, Milk, and Poultry.

In specialized areas of the country, certain states may consider establishing a limited number of training programs in commodity marketing and processing of products such as grain, cotton, fruits and vegetables. Forest Products and Recreation are fields of expanding employment in some states.

Evidence was obtained that there will be an increase in hiring of persons with more than high school education. The surveys were not designed to separate needs for two years of education beyond high school from requirements of a bachelor's degree. Perhaps employers could not

at this time react to something their states and communities do not yet provide.

Some lower level positions pay wages insufficient to attract even young people to training programs. How to raise the efficiency and productivity of the worker in order that the wage scale may be reclassified higher was recognized as a challenge.

From data on numbers of production units in farming, it may be reasonable to conclude that in many states there are almost the same numbers of commercial farms as there are workers in off-farm occupations, when this classification is limited to those employees who need agricultural knowledge. Partly because there are substantial numbers of seasonal workers in fields as Ornamental Horticulture and in Fruit and Vegetable Marketing and Distribution, the annual requirements for new employees in these businesses are larger than in farming.

State studies uniformly found that advancement within an occupation required a higher average level of competency than was required to gain initial entry. This shows need for continuing adult education.

While only preliminary analysis has been made of specific competencies needed in each occupational group and employee field of activity, the general need for business education is clear. Product knowledge is specific to the several major areas of agriculture, including plant and soil science, animal science, agricultural mechanization, and agricultural business management.

It is quite certain that the findings of the series of state studies now being completed will have a marked effect on programs soon to be initiated. It is just as certain that there is urgent need to strengthen, to re-design, to advance the scope and intensity of research in the next several years.

Abstracts of Twenty-Six State Studies

The section of the report which follows contains a two-page abstract of each of the twenty-six state research studies of off-farm agricultural occupations.

The sub-headings in each abstract are (1) Purpose, (2) Method, (3) Findings and (4) Report. The last heading gives the names of the author(s), title of the report, place and date of publication.

In nearly all of the abstracts, a tabular presentation emphasizes some of the important results of the state survey.

ALABAMA

Purpose

The purpose of this study was to ascertain the nature and extent of off-farm agricultural employment opportunities.

Method

Interviews were made with representatives of agricultural businesses and agencies. The study used a modified random sample from 20 counties.

Findings

The extent of off-farm agricultural employment opportunities in the state by business and occupational group is shown below:

Business and Occupational Group	Employees Needing Agricultural Competencies[1]		
	Current Employment	Increase in 5 Years	Percent Increase in Next 5 Years
Agricultural Chemical Manufacture and Sales	352	121	34
Farm Machinery Sales and Services	622	96	15
Farm Supplies and Equipment	807	128	17
Livestock and Poultry	1,065	170	16
Crops, Forestry, and Soil Conservation	361	57	16
Ornamental Horticulture	754	108	14
Agricultural Service	243	52	21
Total	4,204	732	17

[1]Data for 474 payroll firms in 20 counties.

Alabama continued

There were 16,983 persons employed in the 474 payroll firms contacted. Of the total employees, 4,204 or 24.7 per cent were employed in an agricultural occupation. Of the 4,204 persons employed, 830 or 19.7 per cent were employed part-time. The categories with the largest numbers of persons employed had small percentages engaged in agricultural occupations. The largest numbers of part-time employees were engaged in horticulture and in livestock and crop food processing.

In addition to the 4,204 agricultural workers located by the local business interviews, state and federal government agencies reported 2,481 persons employed in agricultural services. Ten per cent were part-time workers. Most required college education. By function, the categories were: Education, 685; Education and Research, 223; Finance and Credit, 99; Regulatory, 424; Service, 1,050.

There were 184 different off-farm agricultural occupations found in the twenty sample counties. A factor analysis of job titles and competencies has been completed for this study.

Report

Baker, R. A., A Study of Employment Opportunities in Off-Farm Agricultural Occupations in Alabama, A Joint Study by the Agricultural Education Service, Alabama State Department of Education, Montgomery, and the Department of Vocational, Technical, and Practical Art Education, School of Education, Auburn University, Auburn, 1965.

ARIZONA

Purpose

The purposes of this study were (1) to determine the essential skills and knowledge needed by individuals for both initial employment and upgrading on the job in various competency areas, and (2) to determine the number of persons employed in the off-farm agricultural occupations by function of the company and by level of employment.

Method

Interviews were made with employers in 121 establishments providing some kind of agricultural service to farm operators. The study was conducted in one county of the state.

Findings

The present employment and future opportunities in the off-farm agricultural occupations are shown by level of employment below:

Level of Employment	Number of Companies	Employees Needing Agricultural Competencies		
		Current Employment	Employment in 5 Years	Number Increase
Professional	39	92	119	27
Technical	16	34	65	31
Supervisory	54	68	76	8
Sales	84	88	131	43
Service	124	497	546	49
Total	317	779	937	158

Arizona continued

A twenty per cent estimated increase in the next five years in the number of employees who need agricultural training was reported by the 121 establishments. Service personnel will be in greatest demand; sales personnel will be in the second greatest demand.

Of the 5,427 total employees in the establishments, 779, or 14.4 per cent currently needed training in agriculture. Of 3,174 employees engaged in processing functions, only 178 or 5.6 per cent needed agricultural competencies.

Report

Wagley, L. A., Educational Requirements for Off-Farm Agricultural Occupations in Yuma County, Arizona. Dissertation, D. Ed., 119 pages. Library, University of Arizona, Tucson, 1964.

CALIFORNIA

Purpose

The purposes of the study were (1) to determine the number and kinds of positions in agricultural businesses that seem to require agricultural training, and (2) to determine the training requirement, both agricultural and business, for workers in these positions.

Method

Interviews were conducted with representatives of 327 companies in 14 centers who had employees needing agricultural training.

Findings

1. The most common types of businesses employing agriculturally-trained persons were those engaged in sales and service of agricultural products and farm supplies.
2. About 20 per cent of the 24,305 persons employed by the companies needed agricultural training.
3. Over 1,400 new agriculturally trained employees will be needed in the near future to fill anticipated new positions in the companies.
4. High school graduation was desired for all levels of employment.
5. The need for actual farm experience was rated high by all employers.
6. Agricultural training ending at the high school level was adequate for a large portion of the semi-skilled and skilled groups, while more advanced training was needed for sales personnel. For consultants, supervisors, and managers, college agriculture was almost a must.

California continued

7. It was apparent that no clear-cut pattern existed for obtaining new employees who have agricultural and business training. The most popular procedure used to find qualified persons was to hire them from another company.

A study was conducted to identify technical workers in California agriculture and their needs in training programs. Some of the findings of the study were:

1. Over 85 per cent of all work activity by technicians was in general fields of work other than farming and ranching.
2. About one-half again as much work activity is engaged in by technicians in the field of agriculture services as in any other general field.
3. Workers engaged in the five general fields of agricultural services, agricultural industry, agricultural research, agricultural business, and farming and ranching account for almost four-fifths of the technical activity in agriculture.
4. Participation in many different activities is evidenced by technicians being engaged in 134 of the 165 possible entries.
5. A need was indicated for training in basic mechanical skills for about two-fifths of all technician positions reported.

Report

Sutherland, S. S., and Thompson, O. E. The Training Required by Workers in Agricultural Business and Industry in California. California State Department of Education, Sacramento, 1957.

Halterman, J. J. Technicians in Agriculture. California State Department of Education, Sacramento, 1962.

COLORADO

Purpose

The purposes of the study were (1) to identify present and emerging agricultural occupations in Colorado, other than farming and ranching, (2) to determine present and anticipated numbers of employees needed in the occupations, and (3) to determine job requirements and other characteristics of the occupations.

Method

Interviews were made in 1964 with employers in businesses, agencies, and organizations whose personnel use agricultural abilities in performance of their duties. The study used a 6.2 per cent state-wide sample.

Findings

The estimated increase in the state of employees needing agricultural competencies by number and per cent is shown below:

Business and Occupational Group	Employees Needing Agricultural Competencies		
	Current Employment	Employment in 5 Years	Per Cent Increase
Farm Machinery Sales and Service	1,155	1,350	16.9
Farm Supplies and Equipment	960	1,004	4.6
Livestock and Poultry Industries	10,132	10,504	3.7
Crops, Forestry, and Soil Conservation	2,366	2,834	19.8
Ornamental Horticulture	2,510	3,803	51.1
Wildlife and Recreation	242	250	3.3
Agricultural Service	3,068	3,391	10.5
Total	20,433	23,136	13.2

Colorado continued

An increase of 13 per cent in workers needing agricultural competencies during the next five years was anticipated. The largest increase is expected in Ornamental Horticulture. The employers interviewed preferred an employee with a "farm reared" residential background. Having had work experience on a farm is an equivalent.

The education level for initial employment desired of prospective employees was "high school plus special training." High school graduation was selected as a minimum requirement by more than 95 per cent of all employers interviewed.

The median weekly salary for beginning employees by levels of employment was as follows:

Level of Employment	Median Weekly Salary
Professional	$121.00
Technical	88.00
Managerial	108.00
Supervisory	87.00
Sales	86.00
Clerical	70.00
Service[1]	62.00

[1]Includes skilled and semi-skilled.

Report

Foster, Paul J., A Study of Agricultural Occupations Other Than Farming and Ranching in Colorado. (Preliminary Report), State Board for Vocational Education, Denver, 1965.

CONNECTICUT

Purpose

To identify occupations other than farming in which competencies in agriculture are needed, to estimate present and future numbers of workers, and to determine curricular offerings that should be considered in new programs.

Method

Teachers of agriculture interviewed firms identified from telephone directories. The sample of 43 towns was equivalent to a 25 per cent sample of the state.

Findings

The state-wide estimate showed full and part-time employment of 22,704 persons in 290 different job titles. The table lists full-time and part-time employees needing competencies in agriculture to be hired by 1970. Major conclusions were:

1. The opportunity to provide agriculturally oriented instructional programs for adults merits early consideration.
2. Most agricultural education departments may consider offerings oriented to the occupational families of livestock industry, ornamental horticulture and food handling and processing. Some departments may consider special programs in other areas.
3. Curricula which focus on agri-business, with secondary stress on agricultural and mechanical competencies seem indicated.
4. Part-time employment opportunities appear to afford good prospects for directed experience.

Connecticut continued

Occupational Family	Current Employment		Number of Employees to Be Hired by 1970	
	Full-Time	Part-Time	Full-Time	Part-Time
Agricultural and Farm Service	568	156	36	167
Crops, Forestry and Soil Conservation	1,200	29	88	15

Total	17,200	5,504	5,304	5,524

*Based on a total count of four major chain stores and eighteen wholesale fruit companies.

Report

The data presented are from a preliminary report by W. H. Martin and Philip T. Masley, University of Connecticut, July, 1965.

DELAWARE

Purpose

The purposes of this study were (1) to identify present and emerging agricultural occupations by job title for which scientific, technical, and vocational agricultural education is needed in Delaware, (2) to list present numbers of workers and estimate numbers to be employed in these occupations in the future, (3) to determine competencies needed, and (4) to describe other characteristics of these occupations.

Method

A disproportionate random sampling method was used to select 267 businesses with employees that needed agricultural knowledge. The interviews conducted averaged a 13 per cent state-wide sample.

Findings

The estimated present total employment in the state in 2053 off-farm agricultural businesses, the number of present employees needing agricultural competencies, and the number to be hired during the next five years are shown in the tabulation on the next page. The 32,776 employees were 20 per cent of the total labor force in Delaware.

The occupational group having the greatest number of employees to be hired during the next five years was Food Marketing and Distribution, with 1,067 needed. Nearly half of them will be part-time workers. Occupational groups having small percentages of employees needing agricultural competencies were Livestock and Poultry; Crops, Forestry and Soil Conservation; and Agricultural Services.

For each seven farmers in the state, there were five workers in off-farm occupations needing agricultural competencies. Approximately

Delaware continued

three per cent of all workers employed in the state, excluding farming, needed agricultural competencies.

Business and Occupational Group	Total Employees in 2,053 Off-Farm Agricultural Businesses	Employees Needing Agricultural Competencies	
		Current (1964)	To Be Hired[1] in 5 Years
Farm Machinery	262	169	82
Farm Supplies	2,998	604	99
Livestock and Poultry	6,102	383	159
Crops, Forestry, and Soil Conservation	6,005	478	216
Ornamental Horticulture	2,663	1,209	385
Wildlife and Recreation	40	8	2
Agricultural Services	8,367	527	144
Food Marketing, Distribution	6,339	1,672	1,067
Total	32,776	5,050	2,154

[1]Employees to be hired during the next five years include additional employees and replacement employees.

Report

Barwick, R. P., Identification of Off-Farm Agricultural Occupations. Preliminary Report, Agricultural Education Publication No. 3., 38 pages, School of Agriculture, University of Delaware, Newark, 1965.

ILLINOIS

Purpose

The purpose of this study was to determine the need for technical education for persons living in and serving rural areas in Illinois.

Method

Interviews were conducted with representatives of businesses which were stratified by the following classifications:

Type 1 - Businesses that are agriculturally oriented

Type 2 - Businesses that are not agriculturally oriented, but often employ workers who must have competence in agricultural knowledge and skills

Type 3 - Non-agricultural businesses

The study used a random sample of 196 stratified businesses in 14 counties in east central Illinois.

Findings

The estimated numbers of workers currently employed who need a knowledge of agriculture and the increase expected in five years, in population centers of less than 25,000, are shown below:

Type of Business	Total Workers	Number Needing Agricultural Competencies: Current Employment	Number Needing Agricultural Competencies: Increase in Next 5 Years
Type 1	8,896	5,487	2,471
Type 2	41,533	3,591	386
Type 3	27,439	558	768
Total	77,868	9,636	3,625

Illinois continued

An estimated 6,020 workers who need some post-high school technical education were employed in businesses of population centers of less than 25,000. Estimates indicate these accounted for 30 per cent of all employees in Type 1 businesses, 6 per cent in Type 2 businesses, and 4 per cent in Type 3 businesses.

After careful inspection of the data, 292 job titles were identified in which some degree of technical education was required. These 292 job titles included 454 technicians and workers needing some post-high school education.

Activities of workers may be used to infer the type of educational program needed. An attempt was made to cluster job titles in terms of the common activities performed by employees using a principal axis factor analysis with a varimax rotation. Twelve activity factors were obtained. For each job title, a factor score was obtained for each of the twelve activity factors.

Report

Phipps, L. J., Krebs, A. H., Hemp, P., Warmbrod, R., and Fuller, G. R., Technicians and Other Workers Who Need Technical Knowledge. Joint Study--Vocational and Technical Education Department, College of Education, and Bureau of Educational Research, University of Illinois, Urbana; and Vocational and Technical Education Division, Springfield, 1964.

Warmbrod, J. Robert, Workers Employed and Employment Opportunities for Workers Needing a Knowledge of Agriculture. 28 p. (mimeo) From Preliminary Report No. 2, Division of Agricultural Education, University of Illinois, Urbana, 1964.

IOWA

Purpose

The purposes of a group of studies of agricultural industires were to determine (1) the employment opportunities in selected off-farm occupations in agriculture, (2) the agricultural competencies needed by males employed in these occupations, and (3) the degree each competency was needed and possessed by employees in these occupations.

Method

The 15 most outstanding employers in selected off-farm agricultural occupation areas served as panels of specialists to develop lists of the agricultural competencies needed by males employed in these businesses. Each list of agricultural competencies, as prepared by the panel of specialists, was submitted to the top ten per cent of the businesses in each of the selected areas. Employers and selected employees in each of the businesses receiving the lists evaluated the degree each competency was needed by employees to effectively carry out their jobs, and the degree of competency employees actually possessed. In addition, employers typical of those in the industry being studied were asked to indicate the present and future manpower needs of their businesses. This information was used to establish future employment opportunities in each of the industries. The study of each of the selected occupational areas is part of an overall state-wide study of the off-farm occupations in agriculture.

Findings

1. The degree of competency needed among the occupational areas within the off-farm agricultural occupation industries varied

Iowa continued

according to the type of understanding, ability, and occupation level.

2. The agricultural competencies needed by sales and managerial employees were similar, but different from those of clerical or service employees.
3. Employer evaluations of employees and employee self-evaluations revealed that a greater degree of competency was needed in agriculture than employees possessed.
4. The smaller the business, the more competent employees needed to be in a greater number of knowledges and skills.
5. As years of farm background increased, the degree of competency needed and possessed by employees increased.
6. In the main, as years of vocational agriculture background increased, the degree of competency needed and possessed by employees increased.
7. As size of business increased, the degree of competency needed and possessed increased in the competencies characteristic of a level of employment.

Report

Bundy, C. E. and Blake, D. L. Competencies in Agriculture Needed by Males Employed in Off-Farm Agricultural Occupations. Cooperative Study - Department of Education, and Iowa Agriculture and Home Economics Experiment Station, Iowa State University of Science and Technology, Ames, and the Vocational Agriculture Section, State Department of Public Instruction, Des Moines, 1965.

KANSAS

Purpose

The purpose of this study was to locate and identify agriculturally oriented occupations in four types of businesses--farm implement, farm produce, farm supply, and farm service.

Method

Interviews were conducted with representatives of the selected businesses which were agriculturally oriented. The study used a 17 per cent random sample of the state which was stratified into four population groups.

Findings

1. From the employers interviewed, it was estimated that 6,787 persons had been employed during the past five years. It was also estimated that 2,823 additional employees would be needed in the State of Kansas in the next five years due solely to the growth in agricultural off-farm business. This figure is in addition to those needed for the normal turnover of employees.
2. A study was made of the special prerequisites for gaining employment in the various job titles. A variety of response was received for the various jobs. More than 88 per cent of the responses reflected a belief that the requirements could be met by a program of special training.
3. Employers were asked to state the minimum educational requirement for entry into the jobs. With two exceptions, the model measure of the responses was for the high school graduate.

Kansas continued

4. Employers were asked to identify those areas, strictly agricultural, with which employees in the various jobs should be familiar. The following are the most frequently selected subject matter areas in order of importance given them by the employers:

   a. General agricultural knowledge

   b. Salesmanship

   c. Tractor, power units, and mechanics

   d. Soils and crops

   e. Agricultural chemicals, insect and pest control

Report

Agan, R. J., A Study of Non-Farm Agricultural Occupations in Kansas. Cooperative Study--Kansas State Board for Vocational Education and The School of Education, Kansas State University, Manhattan, 1963.

KENTUCKY

Purpose

The purposes of this study were (1) to determine the agricultural occupations other than farming, with implications for vocational education, in the following type of businesses: farm machinery, farm supply, agricultural chemical, nursery, and livestock marketing, (2) to determine competency areas important for workers in the businesses, and (3) to determine other characteristics of workers in the businesses.

Method

Interviews were conducted with representatives of businesses and agencies employing workers needing off-farm agricultural competencies. The study covered ten counties in the state.

Findings

1. Farm machinery mechanic was one of the most significant occupations on the basis of frequency of occurrence, job openings, and number of people employed. Others included sales and managerial positions.
2. Farm supply store jobs most significant to vocational education were assistant manager, salesman, and mill operator.
3. Jobs in nursery and related-type businesses most significant were manager, landscape designer, and foreman, at the higher level, and greenhouse, nursery, and landscape crew workers at the lower level.
4. Job openings in agricultural chemical businesses and livestock marketing agencies were very limited in number.

Kentucky continued

5. High school completion was the proper level of education for job entry according to 57 per cent of the responses. Something below was adequate for 23 per cent of the job titles.
6. When four areas of background were studied for people who were planning to enter off-farm agricultural occupations, the rank order of importance was: farm background, prior work experience, high school agriculture, and college agriculture.
7. Dependability was rated more important than personal appearance, politeness, desire to learn, and personal character.

Report

Bingham, W. Agricultural Occupations Other Than Farming in Selected Kentucky Counties, With Implications for Vocational Education. Dissertation, Ph. D., Department of Agricultural Education, College of Education, University of Kentucky, Lexington, 1964.

LOUISIANA

Purpose

The purposes of this study were (1) to determine present numbers of different job titles according to occupational group and levels of employment, (2) to determine agricultural competencies needed for job entry and advancement, (3) to determine special job characteristics and requirements, and (4) to predict trends in occupational opportunities in agriculture.

Method

Interviews were conducted with representatives of businesses and agencies engaged in handling farm products or providing agricultural services. The study sampled seven metropolitan areas of the state.

Findings

The total employment in the businesses interviewed and the numbers of employees needing agricultural competencies are shown below:

Business and Occupational Group	Total Number of Employees	Employees Needing Agricultural Competencies	
		Current Employment	Employment in 5 Years
Farm Machinery Sales and Service	1,056	439	500
Farm Supplies and Equipment	6,128	1,308	1,438
Livestock and Poultry	5,326	1,451	1,519
Crops, Forestry and Soil Conservation	5,927	2,305	2,413
Ornamental Horticulture	872	748	845
Wildlife and Recreation	1,536	300	339
Agricultural Service	9,455	2,536	2,782
Total	30,300	9,087	9,836

Louisiana continued

Report

Mondart, C. L., and Curtis, C. M., Occupational Opportunities and Training Needs for Nonfarm Agricultural Jobs in the Metropolitan Areas of Louisiana, Vocational Agriculture Education No. 6, School of Vocational Education, College of Agriculture, Louisiana State University, Baton Rouge, 1965.

Separate reports have been published for the seven metropolitan areas. Partial summaries from three areas are as follows:

New Orleans

There were 253 businesses surveyed, employing 10,333 workers, of which 1,606 needed agricultural competencies. This number is expected to rise to 1,741 in five years. The present total of 241 different job titles is expected to increase to 278 in five years.

Baton Rouge

There were 153 businesses surveyed, employing 4,612 workers, of which 2,495 needed agricultural competencies. This number is expected to increase to 2,608 in five years. The 2,495 workers were found in 326 job titles, a total that is expected to increase to 388 in five years.

Alexandria-Pineville

There were 139 businesses surveyed, employing 3,048 workers, of which 913 needed agricultural competencies. This number is expected to increase to 975 in five years. The total of 224 job titles is expected to increase to 252 in five years.

MASSACHUSETTS

Purpose

The purposes of this study were (1) to determine employment opportunities in non-farm agricultural occupations in Massachusetts, (2) to determine competencies required by workers in those occupations, and (3) to determine the need for educational programs for entry and advancement in agricultural occupations.

Method

Interviews were conducted with selected employers of workers in agricultural businesses. The study used a 10 per cent state-wide sample.

Findings

The estimated employment and number of workers needing agricultural competencies by level of employment are shown below:

Level of Employment	Total Number of Employees	Number Needing Agricultural Competencies	Per Cent Needing Agricultural Competencies
Professional	2,178	2,150	99
Technical	921	884	96
Managerial	1,343	1,095	82
Sales	6,822	4,661	68
Clerical	2,648	1,557	59
Service	18,042	9,928	55
Total	31,954	20,275	63

Massachusetts continued

Over one-half of the firms interviewed listed sales as the main function of the firm. Over 60 per cent of the employers stated they would be willing to hire high school students as trainees in their firms.

There were 25,494 full-time and 6,460 part-time workers employed in agricultural businesses, compared with 17,000 persons engaged in production on farms in the state. Sixty-three per cent of the workers in the businesses needed agricultural competencies.

A list of 216 job titles was developed from those given by employers and recorded by the interviewers. A condensed list of job titles was then developed by combining the job titles in the original list which appeared to refer to essentially the same duties of employees, resulting in a list of 119 job titles used in the coding and in calculations of characteristics and competencies needed by workers.

Report

Judge, Homer V., Employment Opportunities and Needed Competencies in Off-Farm Agricultural Occupations in Massachusetts. Massachusetts Department of Education, Division of Vocational Education, Boston 16, Massachusetts.

MICHIGAN

Purpose

The purposes of this study were (1) to identify present and emerging agricultural occupations, other than farming and ranching, for which vocational-technical agricultural education should be available, (2) to determine present and anticipated numbers of employees in the occupations, (3) to estimate annual entry opportunities, (4) to determine competencies for entry and satisfactory performance, and (5) to determine other characteristics of the occupations, such as salary, age for entry, formal education, restrictions, etc.

Method

The Michigan Agricultural Conference appointed an Opportunities for Youth committee consisting of representatives from seventeen member firms and organizations. These member groups aided the Vocational Agriculture Service in preparing and testing survey forms. Thirteen firms supplied data for the study. For two of them, the data were expanded to be an estimate of employees on a state-wide basis. They were farm machinery sales and service, and ornamental horticulture (see numbers in parentheses).

Findings

The estimated number of workers needing agricultural competencies is shown on the next page.

Michigan continued

Business and Occupational Group	Employees Having Agricultural Job Titles: Current Employment	Employment in 5 Years	Per Cent Increase in 5 Years
Farm Machinery Sales and Service	238 (3,451)	314 (4,553)	32
Farm Supplies and Equipment	231	305	32
Livestock and Poultry	94	135	44
Crops, Forestry, and Soil Conservation	254	266	5
Ornamental Horticulture	1,058 (3,443)	1,470 (4,750)	38
Agricultural Service	414	515	24
Total	2,289	3,005	31

The firms surveyed employed a total of 4,974 persons, of which, 2,289 or 46 per cent had agricultural job titles. The firms expect to employ 3,005 agricultural workers in five years, an increase of 31 per cent. Eighty different agricultural job titles were identified.

The greatest number increase estimated is in agricultural service occupations. This is in line with Employment Service figures which predict greatest increases in service occupations and least increases in occupations that deal with the production of goods.

Report

Langdon, C. L., A Survey of Agricultural Occupations in Michigan, Vocational Agriculture Service, Michigan Department of Public Instruction, Lansing, and the Michigan Agricultural Conference, 1965.

MINNESOTA

Purpose

The purposes of this study were (1) to identify present and emerging off-farm agricultural occupations, (2) to determine opportunities for employment and competencies required in the occupations, (3) to determine the need for occupational training or retraining and the need for pre-employment vocational education for employees in off-farm agricultural occupations, and (4) to group job titles into occupational groups for which there are common technical education needs.

Method

Interviews were conducted with employers of off-farm agricultural businesses. The data represent four counties in the state.

Findings

The current employment and estimated increase in five years of employees needing agricultural competencies are shown below:

Business and Occupational Group	Employees Needing Agricultural Competencies		
	Current		To Be Hired in Next 5 Years
	Full-time	Part-time	
Farm Machinery	720	122	372
Crops, Forestry, and Soil Conservation	176	36	48
Livestock and Poultry	434	66	53
Ornamental Horticulture	31	69	12
Wildlife and Recreation	10	9	--
Agricultural Service	229	126	81
Total	1,600	428	566

Minnesota continued

The anticipated number of employees needed in the next five years is a conservative estimate. The interviewers found very few employers who kept a record of the number of employees hired during the past.

Weighted-frequency distribution indexes of competencies have been computed for some of the business and occupational groups. Job titles at various levels and product areas with like competencies are being consolidated for future use.

The total number of employees in relation to the employees needing agricultural competencies is considerably higher in rural counties.

Report

Freier, E. E., The Minnesota Agricultural Off-Farm Occupational Opportunities and Training Needs, Mankato Area Vocational-Technical School, Mankato, Minnesota, May, 1965.

MISSISSIPPI

Purpose

The purposes of this study were (1) to identify present agricultural occupations other than farming, (2) to determine employment opportunities in those occupations, (3) to determine needed competencies for employment and other characteristics of those agricultural occupations.

Method

Interviews were conducted with representatives of businesses, industries, and agencies whose employees use agricultural knowledge in their work. The study used a survey of three counties in the Mississippi Delta area.

Findings

The estimated total employment, number of persons needing agricultural competencies, and those needed in five years are shown below for the eleven counties of the Mississippi Delta area.

Business and Occupational Group	Total Employment	Employees Needing Agricultural Competencies	
		Current Employment	Employment in 5 Years
Farm Machinery Sales and Service	1,188	1,148	1,212
Farm Supplies and Equipment	173	139	149
Livestock and Poultry	176	153	166
Crops, Forestry, and Soil Conservation	29	16	16
Ornamental Horticulture	76	73	73
Agricultural Service	3,269	3,163	3,193
Total	4,911	4,692	4,809

Mississippi continued

The total expected increase of workers needing agricultural competencies during the next five years is 2.5 per cent of current employment numbers. Largest expected increases are in the areas of Farm Supplies and Equipment and Livestock and Poultry.

Report

Snowden, O. L., A Study of Employment Opportunities and Needed Competencies in Agricultural Occupations Other than Farming in Eleven Counties of the Mississippi Delta. Mississippi State University, State College, 1965.

MISSOURI

Purpose

The purposes of this study were (1) to identify present and emerging agricultural occupations other than farming, (2) to determine the trends of employment in the occupations, (3) to relate the predominance of certain types of occupations to different sections of the state, (4) to determine specific characteristics about the occupations, and (5) to determine specific characteristics about agricultural businesses.

Method

Interviews were conducted with agriculturally-related businesses which employed personnel where a knowledge of agriculture was beneficial in their job performance. The study was conducted in the communities of 220 school districts in the state.

Findings

The total employment of the firms surveyed and the number of workers that were oriented in agriculture are shown below:

Business and Occupational Group	Total Employment	Employees Oriented in Agriculture	
		Number	Per Cent
Farm Machinery Sales and Service	3,597	2,888	80
Farm Supplies and Equipment	11,090	7,513	68
Livestock and Poultry	10,031	4,801	48
Crops, Forestry, and Soil Conservation	4,287	2,621	61
Ornamental Horticulture	1,152	596	52
Wildlife and Recreation	48	40	83
Agricultural Services	3,157	1,337	41
Total	33,362	19,796	60

Missouri continued

Almost one-half of the firms surveyed were classified under the occupational group of farm supplies. No professional, federal, or state agencies are included in this report. A majority of the firms had been in business over 15 years. Almost 70 per cent of the firms would be willing to cooperate in a program of hiring high school students as trainees.

Most frequently used by employers for obtaining agriculturally oriented personnel were: friends' recommendations, persons dropping in seeking employment, and present employees' recommendations.

Report

Griffin, W. L., Agricultural Occupations Other Than Farming in Missouri, Joint Staff Study, State Department of Education, Jefferson City, Agricultural Education Department, University of Missouri, Columbia, and Teachers of Vocational Agriculture, State of Missouri, 1964.

MONTANA

Purpose

The purposes of this study were (1) to identify present and emerging agricultural occupations, other than farming and ranching, for which vocational and technical education are needed in Montana, (2) to determine present and anticipated numbers of employees by job titles, (3) to determine competencies needed for entry and advancement by occupational group and level of employment, (4) to determine other characteristics of the job titles and occupations, and (5) to identify a "core curriculum" for use in vocational and technical education at the high school, post-high school, and adult levels.

Method

Interviews were made with 161 randomly selected businesses in ten communities of Montana who have employees needing agricultural knowledge, skills and abilities. The study used a 14.4 per cent sample of the ten communities. It included urban as well as rural areas and sampled businesses needing agricultural competencies in hub cities of Montana where agriculture is very strong in the area around the city. The figures represent geographical areas in which one-fourth of the population lives.

Findings

The firms surveyed employed 3,122 persons. Of these, 1,762 or 56.4 per cent needed agricultural competencies. The businesses planned to hire 1,199 employees needing agricultural competencies in the next five years.

Montana continued

Business and Occupational Group	Employees Needing Agricultural Competencies[1] Current Employment	Expected in Five Years	Number To Be Hired
Farm Machinery Sales and Service	1,001	1,204	266
Farm Supplies and Equipment	2,450	2,597	1,344
Livestock and Poultry	4,466	5,362	1,617
Crops, Forestry, and Soil Conservation	840	1,001	952
Ornamental Horticulture	1,505	1,645	2,401
Agricultural Services	2,072	2,485	1,813
Total	12,334	14,294	8,393

[1]Data expanded from the 14.4 per cent sample to a 100 per cent estimate for the ten community areas.

Of the 1,762 total employees needing agricultural competencies, the greatest number of employees are in Livestock Occupations, followed by Farm Supplies and Equipment, and Farm Services.

Report

Heaney, D. S., Vocational and Technical Training Needed for Off-Farm Agricultural Occupations in Selected Communities of Montana. A report will be issued in cooperation with the State Department of Education in Montana and with the Montana State University.

NEVADA

Purpose

To determine numbers of present employees needing an agricultural background and to estimate entry opportunities due to expansion and replacement during the next five years. Also, to determine employee characteristics desired in future workers and to obtain employer judgments of types of schools and subject areas for training new employees.

Method

Names of non-farm business firms and government agencies classified in seven major occupational groups of economic importance in Nevada were obtained from telephone directories, state license lists, and from county agents and vocational agriculture teachers. The data for numbers of employees are for interviews with 363 of a total of 450 firms and for 39 agencies in the state. Employee characteristics by job titles were reported for 310 firms.

Findings

Data on employees in 363 firms interviewed classified by major occupational group, on an industry basis, are tabulated here:

Occupational Group	No. of Firms	Total Employees	Needing Agricultural Background	
			Number	Per Cent
Agricultural and Allied Mechanics	88	1,294	111	8.6
Animal Industry	66	1,027	172	16.7
Agricultural Business, Supply Service	134	15,170	287	1.9
Horticulture Orn. and Turf	46	427	70	17.8
Plant Industry	29	258	76	29.4

Nevada continued

In eight government agencies in Agricultural Mechanics, Animal Industry, Plant Industry and Agricultural Business, 80 per cent of 141 employees needed an agricultural background. Of 2,421 workers in 14 ornamental horticulture related agencies only 3.7 per cent needed agricultural knowledge. There were 17 educational, research, land and forest management, and wildlife and recreation agencies with 588 of 1,063 employees needing agricultural background.

In Nevada 9,362 of 163,262 total persons employed are engaged in agricultural production and 1,493 are in off-farm business occupations needing an agricultural background.

The greatest expansion in total employees in off-farm agricultural businesses in the next five years will be in the Las Vegas area (75 per cent) and the Reno area (46 per cent). In the other areas of the state a 23 per cent expansion is estimated.

Employers readily listed desirable worker traits. They desire ambition, dependability, honesty, and initiative. Potential for management and sales positions was sought in new employees.

Report

Christensen, Howard H., Employment Opportunities in Selected Non-Farm Businesses and Government Agencies as Related to Agricultural Training or Background, Nevada, 1965. 96 p. Agricultural Economics and Education Department, University of Nevada, Reno, 1965. (preliminary mimeo report)

NEW YORK

Purpose

The purposes of this study were (1) to identify the off-farm agricultural occupations, (2) to determine present employment and future employment opportunities in the occupations, (3) to determine the agricultural competencies needed by workers in the occupations, and (4) to determine other characteristics of the occupations.

Method

Interviews were conducted by teachers of agriculture in eighteen school districts with representatives of businesses and services which have employees needing agricultural competencies. The data were expanded to estimates for the 260 school districts offering instruction in agriculture in New York.

Findings

The estimated current full-time employment and the employment expected in five years by business and occupational groups is shown below:

Business and Occupational Group	Employees Needing Agricultural Competencies: Current Employment	Expected in Five Years	Per Cent Increase
Farm Machinery Sales and Service	4,879	6,181	27
Farm Supplies and Equipment	8,967	10,289	15
Livestock and Poultry	3,725	4,007	8
Crops, Forestry, and Soil Conservation	1,169	1,484	27
Ornamental Horticulture	871	1,049	20
Wildlife and Recreation	517	660	28
Agricultural Services	8,557	10,482	22
Total	28,685	34,152	19

New York continued

Based on employers' estimates, workers in the 213 off-farm agricultural occupations spend an average of 83 per cent of their work time on tasks requiring agricultural competencies. The proportion of time thus spent varied from 15 per cent for some job titles to 100 per cent for others.

In addition to the estimated 28,685 full-time employees needing agricultural competencies, it was further estimated that an additional 16,841 persons were employed part-time.

Employers reported that high school graduation was required for 57 per cent of the full-time workers and that 18 per cent needed education beyond high school. Seventeen per cent were reported to need less than high school education.

Report

Cushman, H. R., Christiansen, V. E., and Bice, G. R., Off-Farm Agricultural Occupations in New York State, A Cooperative Research Project of the Rural Education Division, New York State College of Agriculture, Cornell University, Ithaca, Bureau of Agricultural Education, State Education Department, Albany, Contributing Boards of Education, and Boards of Cooperative Educational Services in New York State, 1965.

NORTH CAROLINA

Purpose

The purposes of the study were (1) to determine the nature and extent of the need for providing training in agricultural technology for workers already employed in off-farm agricultural occupations, and (2) to determine the nature and extent of the need for providing training in agricultural technology for individuals who wish to prepare for entering off-farm agricultural occupations.

Method

Interviews and questionnaires were utilized with agricultural industry and business firms; questionnaires were administered to the boys of the 1961 graduating class and were sent to graduates and drop-outs of the 1959 and 1960 classes in vocational agriculture. The study used a nine-county area in the state.

Findings

1. Many agricultural industry and business firms have individuals employed who need additional training. Many of the firms do not have an organized training program.
2. It is evident that technical training should be provided for individuals who wish to be employed by agricultural industry and business firms. Relative to other types of employees, the need for training of the skilled plant worker is by far the greatest.

North Carolina continued

3. It is very apparent that a large per cent of the high school senior boys in 1961 do not plan to attend college, and need and desire an opportunity to take additional training of less than college grade. This also seemed to be true with vocational agriculture graduates and dropouts of 1959 and 1960.

Report

Blackmon, J. H., and Dawson, C. G., Need for Training for Non-Farming Agriculture Occupations. Vocational Division, North Carolina Department of Public Instruction, Raleigh, North Carolina, 1961.

OHIO

Purpose

The purposes of this study were (1) to determine the number of people working off the farm who need at least one agricultural competency in order to maintain their employment, and (2) to identify businesses who employ these workers.

Method

Mail questionnaries were sent to 6,750 businesses, firms, and agencies who employed any workers except farmers, 975 manufacturing firms, and to local governmental agencies, colleges and universities, for a total of 7,874. The study used a 10 per cent sample of the state.

Findings

The estimated number and per cent of Ohio off-farm employees by competency groups is shown in the following tabulation:

Competency Groups	Number of Employees	Per Cent
Industrial	997,276	32.2
Business and Service	860,401	27.7
Agricultural	165,262	5.3
Other	1,081,261	34.8
Total	3,104,200	100.0

Ohio continued

In addition to persons actively engaged in farming, 5.3 per cent of the workers in the state of Ohio need agricultural competencies. There will be 15,000 new off-farm employees having agricultural competencies needed for the next year (includes replacements).

Of all workers required to have competency in agriculture, employers preferred 6.5 per cent to have a farm background. Employers had no background preference for 88 per cent of their employees.

When compared with the Industrial or Business and Service competency groups, a higher per cent of the workers in the Agricultural competency group earned more than $80 per week.

Report

Brum, H. D. Employment Opportunities and Needed Competencies for Workers in Ohio, Ohio Department of Education in cooperation with The Ohio State University and Agencies of the State and Federal Government, Columbus, 1964.

OKLAHOMA

Purpose

The purposes of this study were (1) to identify present and emerging off-farm agricultural occupations for which vocational, technical or higher education should be available, (2) to determine present numbers of employees, annual turnover and entry opportunities, and competencies needed for entry and advancement in the occupations, and (3) to determine other characteristics of the occupations.

Method

Interviews were conducted with representatives of agricultural industries and businesses. The study used a stratified random sample of the state. In interviewing 700 businesses, over 2,000 job-title interviews were made.

Findings

The estimated increase of employees in the state who need agricultural competencies is shown in the following tabulation:

Business and Occupational Group	Employees Needing Agricultural Competencies: Current Employment	Employment in 5 Years	Per Cent Increase
Farm Machinery	1,962	2,780	41.7%
Farm Supplies	2,205	2,775	25.9
Livestock and Poultry	1,659	2,243	35.2
Crops, Forestry, and Soil Conservation	1,029	1,236	20.1
Ornamental Horticulture	2,100	3,063	45.9
Agricultural Service	544	671	23.3
Total	9,499	12,768	34.4

Oklahoma continued

Of the businesses interviewed, the estimated percentage increase during the next five years of the total full-time workers is 32.2 per cent, and of the total part-time workers is 43.0 per cent. The three levels of employment with the greatest numbers of workers in jobs requiring agricultural competencies were service, managerial, and sales, in that order of importance.

A factor analysis of all job titles and competencies showed groupings which may be used in program planning.

Report

Edington, E. D., and Stevenson, B. W., Determining Training and Educational Needs for Persons Employed in Agricultural Occupations in Oklahoma. Cooperative Study--College of Agriculture, Oklahoma State University, and the Oklahoma State Department of Vocational Education, Stillwater, 1964.

PENNSYLVANIA

Purpose

The purposes of this study were (1) to identify agricultural occupations and job titles, (2) to estimate present numbers of employees and entry opportunities, (3) to list competencies needed for entry and advancement, (4) to determine other job characteristics, and (5) to group occupations and job titles for which there are common technical education needs.

Method

Interviews were conducted with representatives of businesses having employees needing agricultural competencies. The study used a random sample of 17 counties.

Findings

The estimated increase of employees needing agricultural competencies during the next five years is shown by the following:

Business and Occupational Group	Employees Needing Agricultural Competencies		
	Current Employment	Employment in 5 Years	To Be Hired During Next Five Years
Farm Machinery Sales and Service	1,056	1,252	444
Farm Supplies and Equipment	3,372	3,920	1,264
Livestock and Poultry	2,820	2,972	872
Crops, Forestry, and Soil Conservation	1,170	1,248	290
Ornamental Horticulture	3,344	3,784	2,180
Wildlife and Recreation	71	85	27
Agricultural Service	704	774	186
Total	12,537	14,035	5,263

Pennsylvania continued

Thirty-five job titles account for 85 per cent of the increase in numbers of workers expected in the next five years.

Seventy-five job titles account for 85 per cent of all workers expected to be hired in the next five years. Twelve service titles, mostly in horticulture, represent over 50 per cent of the turnover, not increase. In the largest occupational groups, salesmen, mill workers, mechanics, and delivery men account for most of the increase expected in full-time workers.

Factor analysis of competencies and of occupational titles by type of business is being done using profiles of competency ratings for classified job titles. Courses to be taught to high school students and to employed adults in off-farm agricultural businesses may be established on the basis of concentrations of degrees of need.

Report

Hoover, N. K., McClay, D. R., and Stevens, G. Z., Technical Education Needs of Persons Engaged in Agricultural Occupations. Joint study--Department of Agricultural Education, The Pennsylvania State University, University Park, and the Division of Agricultural Education, Pennsylvania State Department of Public Instruction, Harrisburg, 1965.

UTAH

Purpose

The purposes of this study were (1) to identify present and emerging agricultural occupations for which vocational and technical agricultural education should be available, (2) to determine present and anticipated numbers of employees, annual entry opportunities, and competencies needed for entry into the occupations, and (3) to determine other characteristics of the occupations.

Method

Interviews were conducted with managers of businesses employing workers who need agricultural competencies. The study used two counties in the state.

Findings

1. In September, 1962, the total work force for the two counties surveyed was 158,819. Approximately 5,729 or 3.6 per cent of the workers were employed in occupations related to farming.
2. The greatest demands for workers were in the areas of animal science, agricultural mechanics, and crops. The specific needs were in meats, trucking, and nursery work.
3. The needs for agricultural training were highest in meats and horticulture. Employers in these occupations are looking for trained employees.
4. The agricultural mechanics area needs experienced men in sales and service. Knowledge of farm equipment is essential to salesmen.

Utah continued

5. The demands are great in almost all fields of off-farm agriculture. Training should be provided for persons on both the high school and the post-high school levels.

Report

Schank, D. R., A Study of the Off-Farm Agriculture Occupations of Utah's Salt Lake and South Davis Counties to Determine Educational Needs. Department of Agricultural Education, Utah State University, Logan, Utah, 1964.

WASHINGTON

Purpose

The purpose of this study was to determine the number and kinds of positions in agricultural businesses that require an agricultural background of experience, or that require training in agriculture and business.

Method

Interviews were made with managers of businesses associated with agriculture. The study used a 17 per cent stratified random sample of the state.

Findings

1. The 241 businesses used in the study indicated that 1,836 or 13.6 per cent of 13,494 present employees needed training in agriculture.
2. When projecting future employment needs, three businesses expected a decrease, 112 expected to remain about the same, and 126, or 52.4 per cent will hire some 550 agriculturally-trained persons within the next five years.
3. It was estimated from the current agriculturally-trained persons in the 241 associated businesses that approximately 3,300 additional employees will be required in the State of Washington in the near future.
4. High school graduation was desired for all levels of employment and will become a must for persons planning to enter the field of agricultural business. Over two-thirds of the

Washington continued

employers asked four years of college preparation of prospective consultants, supervisors, and managers.

5. Starting salaries in agricultural businesses compared favorably with positions in other occupations requiring comparable training and experience

Report

Brown, B. L., Training Requirements of Workers in Business Associated with Agriculture, State Board for Vocational Education, Olympia, 1959.

WEST VIRGINIA

Purpose

The purposes of this study were (1) to identify the various agencies having employees required to possess agricultural competencies, (2) to determine the number of employees in various off-farm agricultural job classifications, (3) to determine some of the basic requirements for entering off-farm agricultural employment, and (4) to identify certain occupations for which training programs may be implemented at high school and post-high school levels for successful entrance.

Method

Interviews were conducted with representatives of a state-wide sampling of businesses with off-farm agricultural employees.

Findings

The present employment and estimated number of persons needed in five years in agricultural occupations are shown in the following:

Business and Occupational Group	Agricultural Occupations Workers		Added Number of Persons Needed in Five Years
	Number	Per Cent	
Farm Supplies and Equipment	1,773	12.8	34
Livestock and Poultry	2,507	18.1	64
Crops, Forestry, and Soil Conservation	5,416	39.1	586
Ornamental Horticulture	1,344	9.7	125
Wildlife and Recreation	831	6.0	122
Agricultural Service	1,980	14.3	140
Total	13,851	100.0	1,071

West Virginia continued

Of the 385,150 persons in the total labor force, 3.6 per cent were in off-farm agricultural occupations and 5.4 per cent in farming. For every two off-farm agricultural workers, there were three workers in production agriculture. Eighty-four per cent of the employing agencies employed less than ten agricultural workers. An eight per cent increase in off-farm agricultural employment was anticipated in the next five years. In the geographic regions where the percentage of workers in farming was higher than the state average, the percentage in off-farm agricultural occupations was also above average.

Report

Bailey, J. K., Non-Farm Agricultural Employment in West Virginia with Implications for Vocational Education Programs, Division of Vocational, Technical, and Adult Education, Charleston, 1965.

How to Obtain Copies of Individual State Reports and Further Information on Studies in Progress

Author(s), title, place and date of publication have been listed at the end of the two-page abstract of each of the twenty-six individual state studies on pages 33 to 85 in this report. A copy of a particular publication may be obtained by writing to the author, to the State University, Department of Agricultural Education, or to the office of the State Supervisor of Vocational Agriculture.

Many of the leaders of the state studies of off-farm agricultural occupations are continuing the analysis of data obtained on interview schedules. They intend to publish additional reports, with emphasis on competency groupings and course of study recommendations. Correspondence with a study leader may result in more rapid dissemination of findings and of research procedures worthy of adaptation to other states.

New research projects in occupations areas are being designed in several states that have completed one or more studies. Different theoretical considerations form the basic approach, and new data schedules have components not previously included.

States such as New Hampshire, Vermont, Rhode Island, New Jersey, Tennessee, Virginia, Florida, Indiana, and others for which information is not yet released will initiate and/or complete and publish studies in the near future. The Summaries of Studies in Agricultural Education series and other sources listing staff and thesis research will continue to report a steadily increasing output of valuable regional and local research on agricultural occupations.

*EMPLOYMENT TRENDS, *EMPLOYMENT STATISTICS, *OCCUPATIONS, *LABOR FORCE,

Colorado,

Current and projected employment statistics are given for the state and for the Denver Standard Metropolitan Statistical Area which includes Adams, Arapahoe, Boulder, Denver, and Jefferson Counties. Data were obtained from the Colorado Department of Employment, Denver Research Institute, U.S. Census, University of Colorado, Mountain States Telephone Company, and Public Service Company publications. Employment figures for 1950, 1960, 1965, and 1970 are shown for agriculture, mining, construction, total manufacturing, food products, textiles and apparels, rubber and plastic products, chemicals, printing and publishing, other nondurable goods, furniture, lumber and wood products, primary metals, fabricated metals and ordnance, machinery except electrical, electrical machinery, electrical equipment and supplies, transportation equipment, other durable goods, railroads, trucking and warehousing, other transportation, communications, utilities and sanitary services, business and repair services, entertainment and recreation services, medical and health, wholesale, total retail, food stores, eating and drinking, general merchandise and variety stores, auto dealers and gas stations, finance, insurance and real estate, federal government, and state and local government. Trends in each classification are commented on. (PS)

OCCUPATIONS IN COLORADO

The purpose of this report is to present information about occupations in the State of Colorado and briefly discuss the apparent occupational outlook by industry and then by occupation. No new data are presented in the report; rather, the tables are simply a reorganization of existing data drawn primarily from the following sources.

1. Labor Market Highlights, Colorado Department of Employment, A monthly publication.
2. Mahar, J. T., Coddington, D. C., and Gilmore, J. S. Economic Forces Behind Colorado's Growth, 1870-1962 with Projections to 1970. Denver Research Institute, 1963.
3. Colorado--General Social and Economic Characteristics. U.S. Census. 1960.
4. Vaughn, R. D. Denver Metropolitan Area Economic and Social Profile. Mountain States Telephone Co., Denver. 1963.
5. Public Service Company. An Analysis of Colorado's Economy with Projections to 1970. Denver. 1965.
6. First Annual Colorado Business and Economic Outlook Forum. Univ. of Colorado and Colorado Division of Commerce and Development. 1965.

In the first part of the report, employment data are presented for industrial classifications for the State and for the Denver Standard Metopolitan Statistical Area which includes Adams, Arapahoe, Boulder, Denver, and Jefferson Counties.

The 1950 data for the state are census data. We originally used the census reports for the 1960 state data, but several inconsistencies appeared perhaps because census data are based on self-reports. The census figures generally seemed to be too large when compared with other sources and did not fit the 1965 figures and the 1970 projections as well as the data from other sources. Consequently, most of the 1960 figures for the state were obtained from reports number two, five, and six above, except where otherwise indicated. The 1965 figures for the state were taken from the Labor Market Highlights and the projections are mainly from the Mahar, et. al. report; number two above.

The Denver figures for 1950, 1960, and 1970 were taken from the Vaughn report; number four above. The 1965 figures for Denver are from the Labor Market Highlights. The 1960 figures in the Vaughn report were taken from census reports and one should keep in mind that these figures may be overestimates of actual employment in Denver in 1960. No other source was available for employment in Denver in 1960.

The data in the tables should be interpreted cautiously for various reasons. One reason is indicated in the above paragraphs; another reason is that the various reports may have used differing definitions for the categories, a third source of inaccuracy is the possibility that different techniques of projection were used by the investigators, and a fourth source is the extent to which certain assumptions are violated or not met in making the projections.

The reader who is interested in a more detailed analysis of the employment situation in the state than is provided in this report should examine the references cited above. The Public Service Report and The First Annual Forum Report (numbers five and six) are recent and provide good analyses of the employment situation in the state.

TOTAL EMPLOYMENT
(Does not include self-employed)
(In Thousands)

1950 No.	1960 No.		1965 No.	1970 No.
476	625		631	783
		Denver		
234	353		374	480

Total employment in the state is increasing, but the growth from 1960-1965 for the State and for Denver suggests that the 1970 projections may be high. Many factors influence this employment picture, however, and any significant change in one or a combination of these factors can influence the employment figure a great deal. Because of the many factors operating on employment, long term projections are very hazardous.

The Mahar, et. al., projections are based on the following assumptions.

1. That no major discontinuities will occur in Colorado industry. An example of a major discontinuity would be the location of the atom smasher in Colorado.
2. No major depression will occur.
3. No major war will occur.
4. The Cold War will continue.
5. Climate and governmental policy will not vary from the usual pattern.

It is evident that all of these assumptions have not been completely met, and to the extent that any have been violated to that extent might the data be misleading.

An overall summary of the data indicates that the employment pattern, by industry in terms of numbers employed is as follows:

Declining	Stable	Expanding
Agriculture	Mining	Construction
Railroads	Manufacturing of:	Manufacturing of:
	Textiles and Apparel	Fabricated Metals & Ordinance
	Rubber and Plastics	Electrical Machinery
	Furniture and Wood Products	Transportation Eqpt.
		Printing & Publishing
	Machinery, except electrical	Total Manufacturing
	Primary Metals	Communications
	Chemicals	Services
	Wood and Kindred Products	Wholesale Trade
	Trucking and Warehousing	Retail Trade
	Other Transportation	Finance & Insurance
		Government

AGRICULTURE
(State)
(In Thousands)

1950		1960		1965		1970	
Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed
72.4	15.2	48.6	7.8	45.4	7.2	44.0	5.5
			Denver SMSA				
8.8	3.8	7.0	2.0	5.0	1.1	5.5	1.1

The data in the above table reflect the established fact that agricultural employment is declining at a rather rapid pace. Rehnberg has reported data which suggest that the decline in agricultural employment is primarily due to a decline in farm operators, and that other agricultural employment is remaining somewhat more constant. His data are in the following table taken from Rehnberg, R.D. "Growth of Farms and Optimal Rates of Out-Migration from Farm to Non-Farm Communities". (Mimeographed Paper)

COLORADO FARM OPERATORS, PAST AND PROJECTED

1950	1960	1970	1980
45,500	33,100	24,400	17,200

The 1970 projection figure for total agricultural employment in the state appears to be a reasonable estimate based on what has happened between 1960 and 1965.

The Denver SMSA figures indicate that agricultural employment is limited in this area as would be expected. The 1970 projection for the Denver SMSA appears to be somewhat of an overestimate since fewer than the projected figure were employed in this industry in 1965.

MINING
(State)
(In Thousands)

1950		1960		1965		1970	
Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed
10.3	2.1	14.2	2.3	12.4	1.9	15.0	1.9
			Denver SMSA				
1.3	0.6	3.3	0.9	3.3	0.8	4.3	0.9

The mining industry presents a relatively stable picture in terms of employment in the state. The decline from 1960 to 1965 suggests that the 1970 figure is an overestimate. The Public Service Report for 1965 projects employment in mining to reach 13,000 in 1970 which may be more realistic than the above figure of 15,000. Most mining activity is expected in petroleum (including shale oil), molybdenum, coal, and the non-metals such as clay, stone, brick, etc. Output of uranium, gold, silver, lead, and zinc is expected to decline unless government policy changes with respect to these metals.*

Mining employment is quite small in the Denver SMSA.

*See reference number five on page one of this report.

CONSTRUCTION
(State)

1950		1960		1965		1970	
Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed
38.8	8.1	44.2	7.0	35.7	5.6	60.0	7.5
			Denver				
19.5	8.3	24.7	7.0	21.5	5.4	32.2	6.7

The data are not clear with respect to construction employment. Perhaps this is an area where differing definitions have been used. The census data and the 1970 projections report on a category of "construction" whereas the Labor Market Highlights use a category called "contract construction". Whether these are defined the same is not clear. The Public Service Report indicates construction employment to be about 50,000 in the state in 1965 which suggests that the "contract construction" category is more restrictive than the "construction" category. Assuming this is so, it would appear the 1970 projection is a reasonable estimate. Construction employment, however, is quite sensitive to economic changes, and if, for example, the atom smasher installation were to be awarded to Colorado, the projected figure would likely be an underestimate.

The construction employment figures for Denver parallel the State figures quite closely which suggests that one might use Denver employment data for this industry as an estimate of State data.

TOTAL MANUFACTURING
(State)
(In Thousands)

1950		1960		1965		1970	
Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed
56.7		88.0	14.8	88.3	14.0	110.0	14.0
			Denver				
37.4	16.0	67.6	19.1	62.2	15.8	91.7	19.1

Employment in manufacturing remained stable during the period of 1960 to 1965. The Public Service Report indicates manufacturing employment to be about 88,000 in 1960 and the Mahar, et al., report shows manufacturing employment at 90,800 in 1962.

The curve for manufacturing employment since 1950 shows a general increasing trend and even though the trend was not maintained in the first half of the decade, it is likely that manufacturing employment will increase by 1970 although the projected figures seem to be quite high.

Manufacturing employment in Denver is proportionately greater than for the rest of the state. Because the manufacturing employment totals in Denver account for a sizable proportion of the total state manufacturing employment, it would appear such data for the Denver area would allow reasonable estimates of the State. The accuracy of these estimates will vary with type of manufacturing as is evidenced in the following 13 tables.

FOOD AND KINDRED PRODUCTS
(State)
(In Thousands)

1950		1960		1965		1970	
Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed
13.8	3.4	17.0	2.7	18.3	2.9	18.0	2.3
			Denver				
8.6	3.7	11.5	3.3	12.5	3.1	14.7	3.1

Employment in the manufacturing of food and kindred products is remaining relatively stable. The output of these products has increased, but improved production techniques have allowed production increase without a corresponding increase in employment.

The 1970 employment projection figures appear to be reasonable estimates, although the state growth from 1960 to 1965 suggests the state figure for 1970 may be somewhat of an underestimate.

The Denver data parallel the state data fairly well, and suggest that what occurs in this industry in the Denver area will reflect the State situation fairly well.

TEXTILES AND APPARELS
(State)
(In Thousands)

1950		1960		1965		1970	
Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed
1.6	.3	2.0	.3	2.3	.4	2.5	.3
			Denver				
1.4	.6	1.9	.6	2.2	.6	2.7	.6

Employment in the manufacture of textiles and apparel is quite limited in the state, but is showing some growth. The growth is about consistent with total employment expansion. The projection figures seem to be quite reasonable, except that the Denver projection may be slightly high.

RUBBER AND PLASTIC PRODUCTS
(State)
(In Thousands)

1950		1960		1965		1970	
Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed
NA		6.0	.9	5.1	.8	6.5	.8
			Denver				
NA		5.9	1.7	5.1	1.3	6.5	1.3

Some inconsistency of reporting is likely occuring with respect to employment in this area. Some reporters use a classification of Leather, Rubber, and Plastic Products and others combine Leather with the Textiles and Apparel category. Thus, the decline from 1960 to 1965 indicated in the table may be a matter of definition. The 1970 estimates may be slightly high, but do not appear unreasonable.

Apparently nearly all of such manufacturing is centered in the Denver area, and thus the data for Denver are indicative of the state-wide employment in this industry.

CHEMICALS
(State)
(In Thousands)

1950		1960		1965		1970	
Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed
1.7	.4	2.6	.4	2.1	.3	3.0	.3
			Denver				
1.7	.7	2.6	.7	1.6	.4	3.8	.8

Employment in the manufacturing of chemicals is not a large factor in the total employment picture. The 1970 projection for the state appears to be reasonable, but the Denver projection seems to be an overestimate. These differences probably reflect a different projection technique used by the two investigators.

PRINTING AND PUBLISHING
(State)
(In Thousands)

1950		1960		1965		1970	
Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed
6.8	1.2	8.0	1.5	8.2	1.3	9.5	1.2
				Denver			
4.4	1.9	6.9	2.0	6.0	1.5	9.4	2.0

The employment in this industry shows a steady growth pattern, and indicates the 1970 projections are realistic.

There is some inconsistency in the two projection figures, either the State figure is too low or the Denver figure is too high. The Denver growth from 1960 to 1965 suggests that the Denver projection is an overestimate. One should keep in mind also the possibility that the 1960 figures for Denver are somewhat high.

OTHER NONDURABLE GOODS
(State)
(In Thousands)

1950		1960		1965		1970	
Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed
NA		4.7	.8	4.6	.7	6.3	.8
				Denver			
NA		4.7	1.3	4.1	1.0	7.1	1.5

This is a "catch-all" category and the figures are difficult to interpret. The difference between the 1970 projection figures probably reflects a methodological difference between the two investigators.

FURNITURE, LUMBER AND WOOD PRODUCTS
(State)
(In Thousands)

1950		1960		1965		1970	
Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed
2.9	0.6	3.0	0.5	3.4	0.6	3.5	0.4
			Denver				
1.3	0.5	1.4	0.4	1.7	0.4	1.9	0.4

Employment in this industry is showing a small but steady pattern of growth. The expansion from 1960 to 1965 suggests that the 1970 projection may be somewhat low.

The employment in this industry in Denver in relation to total employment seems to be quite representative of statewide employment in the manufacture of furniture, lumber, and wood products.

PRIMARY METALS
(State)
(In Thousands)

1950		1960		1965		1970	
Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed
9.4	1.9	8.8	1.5	8.7	1.4	10.0	1.3
			Denver				
1.9	0.8	1.6	0.4	1.4	.3	1.3	0.3

Employment in primary metals manufacturing has apparently declined from 1960 to 1965. Considering all the figures, it would appear that the 1970 projection for the state is somewhat higher than seems reasonable.

Employment in the primary metals industry in Denver does not appear to be representative of the state. One employer, in fact, provides about 80% of the employment in this industry, and this one employer is outside of Denver.

FABRICATED METALS AND ORDNANCE
(State)
(In Thousands)

1950		1960		1965		1970	
Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed
NA		18.7	2.8*	15.8	2.5	21.0	2.9
			Denver				
1.9	0.8	14.8	4.2	14.4	3.6	19.0	4.0

The employment pattern in this industry is somewhat confusing because of the decline from 1960 to 1965. An immediate interpretation is that the State decline is related to the reduction at the Martin-Marietta Corporation, but this is not reflected in the Denver figures. The Martin-Marietta Corporation is located in the Denver SMSA.

The 1960 figures may be somewhat high, but no other source than the census is available for comparison in this specific category because the other sources have combined this category with other categories.

Based on the available 1960-1965 figures, it would appear the 1970 projections are overestimates. It should be recognized, however, the employment in this industry is very much influenced by what happens in one or two firms, and if the Martin-Marietta Corporation, for example, were to be awarded additional defense contracts the projection figures would be attained or surpassed.

*1960 census figure

MACHINERY, Except Electrical
(State)
(In Thousands)

1950		1960		1965		1970	
Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed
NA		6.9	1.0*	6.3	1.0	7.5	.9
			Denver				
3.0	1.3	5.1	1.5	4.9	1.2	7.2	1.5

Employment in the manufacturing of machinery appears to be relatively stable although the 1970 projections may be somewhat overestimated.

Much of this industry is apparently located in the Denver area, and employment figures for the Denver area would seem to be rather reliable indicators of the employment growth pattern for the state.

ELECTRICAL MACHINERY, EQUIPMENT, AND SUPPLIES
(State)
(In Thousands)

1950		1960		1965		1970	
Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed
NA		3.8	0.6*	4.9	0.7	6.0	0.8
			Denver				
0.7	0.3	2.6	0.7	2.1	0.6	6.2	1.3

Manufacturing of electrical machinery, equipment, and supplies is becoming increasingly important in the state. The figures in the table indicate a moderate growth and the statewide 1970 projection seems reasonable. Much of the growth in this industry is occurring outside of the Denver area so that the 1970 projection for Denver appears to be an overestimate. It should be pointed out, however, that the IBM installation near Boulder and the expansion of Ball Brothers at Boulder will be reflected in the Denver area employment figures. Considering these developments, it would seem that the Denver projection is realistic and the statewide projection is an underestimate.

All forecasters predict growth in industries that manufacture a commodity with a high value per pound such as this one is.

*1960 census figure

TRANSPORTATION EQUIPMENT
(State)
(In Thousands)

	1950		1960		1965		1970	
	Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed
	NA		3.9	0.6*	3.6	0.6	6.0	0.8
Denver	0.9	0.2	2.7	0.8	2.9	0.8	3.8	0.8

Employment in the manufacture of transportation equipment has remained relatively stable through the first five years of the decade. The projection figures seem to be overestimated somewhat.

OTHER DURABLE GOODS
(State)
(In Thousands)

	1950		1960		1965		1970	
	Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed
	NA		8.0	1.2	7.8	1.2	11.7	1.5
Denver	3.4	1.5	5.6	1.6	5.2	1.3	8.1	1.7

This is another "catch-all" category so that the figures are difficult to discuss.

*1960 census figure

RAILROADS
(State)
(In Thousands)

1950		1960		1965		1970	
Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed
15.1	3.2	10.0	1.5	8.8	1.3	9.0	1.1
			Denver				
8.0	3.4	5.4	1.5	5.1	1.3	4.8	1.0

Rail employment has continued to decline from 1960 to 1965. Forecasters are predicting that the railroads' competitive position will improve thus increasing business. The employment effect of this increased business is that it will offset employment reduction due to technological improvements. If this forecast is accurate, then the employment in railroads should stabilize and the 1970 projection seems reasonable. The decline from 1960 to 1965 suggests, however, that the 1970 projection is high for the state, and realistic for Denver.

Employment in the railroad industry in Denver in relation to total employment is very similar to the state pattern.

TRUCKING AND WAREHOUSING
(State)
(In Thousands)

1950		1960		1965		1970	
Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed
5.9	1.2	11.0	1.7	10.6	1.5	12.0	1.5
			Denver				
4.6	2.0	7.1	2.0	7.9	2.0	9.1	1.9

Employment in the trucking industry appears to have leveled off and the 1970 projections seem to be reasonable estimates. The apparent decline in the state from 1960 to 1965 is rather small and likely will be reversed with the completion of additional segments of the Interstate Highways.

OTHER TRANSPORTATION (Air, Cabs, Buses, Pipelines)
(State)
(In Thousands)

1950		1960		1965		1970	
Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed
6.1	1.3	7.0	1.5	6.8	1.1	5.8	0.7
			Denver				
4.7	2.0	5.9	1.7	5.9	1.5	7.7	1.6

Employment in this category has declined from 1960 to 1965 in the state and remained stable in Denver for the same period. The 1970 projection figures for the state and for Denver differ considerably. Recent developments, such as the opening of the United Airlines training facility and the opening of the new Stapleton airfield terminal, will likely stimulate employment in the air industry in the state. It would appear then that the 1970 projection figure for the State may be somewhat of an underestimate.

COMMUNICATIONS
(State)
(In Thousands)

1950		1960		1965		1970	
Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed
8.6	1.8	10.0	1.6	10.9	1.7	12.0	1.5
			Denver				
4.6	2.0	6.5	1.8	7.5	1.9	8.2	1.7

The communications industry is expanding at a steady rate and employment from technological advance is off-set by increased production.

The 1970 projection figures appear to be reasonable for the State and for Denver. The pattern of employment in this industry appears to be similar in Denver and the State.

UTILITIES AND SANITARY SERVICES
(State)
(In Thousands)

1950		1960		1965		1970	
Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed
5.2	1.1	7.0	1.5	7.4	1.1	8.3	1.1
			Denver				
3.9	1.7	5.1	1.4	4.2	1.1	6.7	1.4

Employment in this category appears to be stable and the 1970 projection seems reasonable.

HOTEL SERVICES
(State)
(In Thousands)

	1950		1960		1965		1970	
	Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed
	68.0	14.3	76.3	16.4	96.0	15.2	130.0	16.6
Denver								
	NA		69.2	17.6	64.2	16.3	96.0	20.0

Employment in the services industry is expanding in terms of numbers employed although perhaps the expansion rate is not consistent with total employment. The 1970 projections appear to be somewhat high in view of the 1960-65 figures.

BUSINESS AND REPAIR SERVICES
(State)
(In Thousands)

	1950		1960		1965		1970	
	Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed
	NA		14.0	2.6	14.6	2.2	19.0	NA
Denver								
	7.7	3.3	10.6	3.0	11.2	2.8	16.3	3.4

Employment in business and repair services seems to be growing. The 1970 projections for the state and for Denver both seem to be quite high, however, in view of the rather limited growth that has occurred between 1960 and 1965.

ENTERTAINMENT AND RECREATION SERVICES
(State)
(In Thousands)

1950		1960		1965		1970	
Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed
NA		5.0	0.9	6.3	1.0	10.0	NA
			Denver				
2.9	1.2	3.3	0.9	3.9	1.0	4.8	1.0

The figures indicate employment in this category is rising. The 1970 projection for the state is from the Public Service Report and appears to be high in comparison with the other data. One should consider, however, that employment in this category is very much related to the increased amount of leisure time and to the development of the tourist industry in the state so that it may be that the projected figure will be attained.

MEDICAL AND OTHER HEALTH SERVICES
(State)
(In Thousands)

1950		1960		1965		1970	
Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed
NA		21.0	4.9	28.1	4.4	40.0	NA
			Denver				
7.4	3.2	16.9	5.1	18.0	4.6	16.7	3.4

Employment in medical services has increased from 1960-65. The Public Service Report projection of about 40,000 for the State in 1970 appears to be somewhat of an overestimate on the basis of the 1960-65 figures, and the Denver projection appears to be a considerable underestimate.

WHOLESALE TRADE
(State)
(In Thousands)

1950		1960		1965		1970	
Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed
23.0	4.8	30.0	3.7	36.2	5.7	39.0	4.9
			Denver				
12.8	5.5	17.4	4.9	30.0	7.6	22.6	4.7

The U.S. Department of Commerce Report on Wholesale Trade--Colorado, 1963 cites a figure of about 30,000 employed in the wholesale trade in Colorado in 1958. Using the figure of 30,000 in the State for 1960 the pattern seems to be reasonable.

In the state, there appears to be a continued growth in employment in the wholesale trade industry and the 1970 projection appears reasonable. The Denver projection, on the other hand appears to be a large underestimate, and on the basis of the other data in the table a figure of 32.6 would seem more reasonable.

TOTAL RETAIL TRADE
(State)
(In Thousands)

1950		1960		1965		1970	
Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed
65.5	13.8	90.0	15.4	103.0	16.3	121.0	15.4
			Denver				
43.3	18.5	57.4	16.2	63.4	16.1	76.1	15.7

Employment in retail trade is growing at a pace consistent with total employment growth. The 1970 projections appear reasonable, both for the state and for Denver.

FOOD STORES
(State)
(In Thousands)

1950		1960		1965		1970	
Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed
8.3	1.8	15.0	2.4	15.5	2.4	16.4	2.1
Denver							
6.8	2.9	9.3	2.6	9.9	2.5	12.0	2.5

Employment in food stores is growing at a steady pace and the 1970 projections appear reasonable.

EATING AND DRINKING
(State)
(In Thousands)

1950		1960		1965		1970	
Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed
12.1	2.5	20.0	3.1	23.8	3.7	25.8	3.3
Denver							
8.3	3.6	10.9	3.1	14.3	3.6	14.4	3.0

The employment pattern in this industry is also showing a steady growth rate. The 1970 projections appear reasonable although the Denver projection may be somewhat low.

GENERAL MCHDSE AND VARIETY STORES
(State)
(In Thousands)

1950		1960		1965		1970	
Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed
16.8	3.5	16.0	2.4	24.3	3.8	NA	
			Denver				
NA		10.7	3.0	17.4	4.4	NA	

Employment in general merchandise and variety stores is expanding. No projection figures are available for this category.

AUTO DEALERS AND GAS STATIONS
(State)
(In Thousands)

1950		1960		1965		1970	
Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed
11.3	2.4	15.0	2.4	16.2	2.6	NA	
			Denver				
NA		NA		8.9	2.3	NA	

Employment in this category also seems to be growing. The data are not available for many of the cells. The rise of tourism and the increased number of cars both are factors that suggest employment in this category will continue to grow.

OTHER RETAIL
(State)
(In Thousands)

1950		1960		1965		1970	
Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed
28.3	5.9	24.0	7.5	39.4	6.2	NA	
			Denver				
NA		26.5	7.5	21.8	5.5	NA	

This is a "catch-all" category, with rather significant numbers in the cells. It is, however, difficult to interpret because of the varied definitions used in other categories by the investigators with the result that these residuals also differ considerably.

FINANCE, INSURANCE, AND REAL ESTATE
(State)
(In Thousands)

1950		1960		1965		1970	
Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed
16.9	3.5	29.0	4.7	31.1	4.9	40.0	5.1
			Denver				
11.7	5.0	20.7	5.9	23.7	6.0	30.6	6.3

Employment in this industry appears to be growing at a somewhat higher rate than total employment. The 1970 projections appear reasonable for the State and for Denver.

FEDERAL GOVERNMENT
(In Thousands)

1950		1960		1965		1970	
Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed
24.9	5.2	33.9	5.4	40.1	6.3	41.4	5.3
			Denver				
NA		NA		24.0	6.1	NA	

Federal government employment is increasing in the state. The 1970 projection may be somewhat low in view of the 1960-65 growth. Only the 1965 figures are available for Denver.

STATE AND LOCAL GOVT.
(State)
(In Thousands)

1950		1960		1965		1970	
Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed	Number	Proportion of Employed
46.6	10.0	78.1	12.4	98.1	15.5	103.1	13.1
			Denver				
NA		NA		46.6	11.8	NA	

State and local government employment is also increasing and the 1960-65 growth suggests that the 1970 projection is somewhat low.

*EDUCATIONAL RESEARCH, *VOCATIONAL EDUCATION, QUESTIONNAIRES, SURVEYS, *ADMINISTRATOR ATTITUDES, *TEACHER ATTITUDES, RESEARCH SKILLS, PRACTICAL ARTS, COUNSELORS, INTEREST RESEARCH, TEACHERS, EDUCATIONAL PROGRAMS,

Minnesota,

One survey identifies educators in the state who are interested in conducting or receiving training for research in occupational education and estimates their present level of research competence. A second survey identifies the educational administrators in the state who have supportive attitudes toward their staff's participation in occupational education research. Questionnaires were mailed to 5,441 persons -- (1) all the vocational and practical arts educators and guidance counselors in the state at the junior, senior, and post high school level, and (2) educators in related fields in colleges. Of this group, 454 (8.2 percent) expressed an interest in research, and 410 expressed a desire to receive additional research training. Of those who expressed an interest, 48 percent had adequate research experience. The greatest number of interested persons were in industrial arts, guidance, and business and distributive education. The population of the second survey consisted of superintendents, principals, directors, deans, and department heads (648 of 1,186 responded). Approximately 54 percent of the educational administrators in the state had supportive attitudes toward research in occupational education. They perceived the availability of local support as the major obstacle for initiating occupational education research projects. (PS)

FOREWORD

Every research coordination unit is faced with the task of stimulating and facilitating occupational education research in its state. To accomplish the task it may elect to work with well-known, competent researchers. Units may also choose to identify and cultivate potential investigators as part of a long range effort to increase the research resources in the state. This report describes two coordinated survey studies that constitute an attempt to assess the current human resource potential for occupational education research in Minnesota.

The first survey identifies educators in the State who are interested in conducting, and/or in receiving training for research in occupational education, and estimates their present level of research competence. The second survey identifies the educational administrators in the State who have supportive attitudes toward their staff's participation in occupational education research, and determines the kinds of problems the administration perceive as barriers to initiating research in their schools or school systems. By combining the findings of these two studies, the Minnesota Research Coordination Unit now knows administrators' attitudes and perceived problems in each school employing interested potential researchers. This information will guide the Unit's future stimulation and research training activities, and assist in making dissemination efforts more efficient.

Jerome Moss, Jr., Co-Director
Minnesota Research Coordination
Unit in Occupational Education

CHAPTER I

THE FIRST SURVEY

The Problem

The problem of the first survey was to identify those persons teaching in Minnesota in fields related to vocational and practical arts education, including guidance counselors, who were either interested in conducting research and/or in acquiring further research training. Since it was hoped that the group identified would ultimately become involved in research, it was also necessary to assess their research competencies.

Definitions

Research Interest: A response (returned questionnaire) was assumed to indicate that the respondent was interested in research, and conversely, a non-response indicated a lack of interest. Interest was classified into categories of (1) an interest in conducting research, (2) an interest in acquiring further research training, or (3) both of the above.

Research Competencies: A competent researcher was defined as a person possessing both adequate academic preparation and research experience, (i.e. a person who is presumably prepared to undertake an experimental research project and carry it to completion with a minimum of technical assistance). On the basis of responses to the questionnaire items (see Appendix A) persons were categorized into one of three categories of academic research preparation: (1) adequate, (2) limited, and (3) inadequate, and one of two categories of research experience, (1) adequate, and (2) inadequate.

Objectives

As indicated in the problem statement the principal questions to be answered by the study were:

1. Who are the persons in the population that are interested in conducting research and/or in acquiring further research training in occupational education?

2. Is there a sufficient number of persons in the population interested in acquiring further research training to justify the establishment of a research training institute in occupational education?

3. What are the research competencies of those persons in the population expressing an interest in conducting research and/or in acquiring further research training?

Methodology

Population: The population surveyed consisted of a) all the vocational and practical arts educators in the State of Minnesota, 1965-66, including guidance counselors, at the junior, senior and post high school levels, and b) educators in "related" fields in collegiate institutions. The total population of 5441 persons was stratified according to their respective areas of specialization, (e.g. trade and industrial education, home economics education, business education, industrial arts education, counseling, etc.)

The Questionnaire and Mailing Procedures: One mailing was used without a follow-up procedure in light of the assumption that a response indicated interest and no response indicated a lack of interest. The contents of the mailing to the total population consisted of a two-color, printed brochure announcing the establishment and proposed purposes of the Minnesota Research Coordination Unit in Occupational Education, and a printed business reply card questionnaire. The questionnaire contained a number of items about the respondent's research interest and competence. Other items were designed to assess field of specialization and employing institution (see Appendix A.) All recipients were urged to complete and return the card if they possessed an interest in some phase of occupational education research or research training.

Determining Level of Research Competence: A panel of five experienced researchers in the College of Education, University of Minnesota, agreed that a rough estimate could be made of an individual's competence to conduct experimental research by determining the amount and kind of his academic preparation and research experience. In order to evaluate academic preparation the panel further agreed upon the appropriateness and relative weights of the following factors:

(6) Inferential Statistics	(6) Doctorate Degree
(4) Research Methods Course	(4) Masters Degree Plus
(3) Research Assistantship	(3) Masters Degree
(2) Descriptive Statistics	(2) Bachelors Degree Plus
	(1) Bachelors Degree
	(0) No Degree

Recency of Research Preparation: (0) 1955 (1) 1956-60 (2) 1961-65

"Adequate experimental researchers were defined as those respondents who had a total score of 16-23 on the above factors; "limited" researchers were defined as respondents with total scores between 7 and 15; "inadequate" researchers had total scores of 6 or less.

At the panel's suggestion, the number and recency of studies completed (including research to satisfy degree requirements) were measured to assess research experience. The following values were assigned to numbers of studies completed: (0) none, (6) one, (10) two-four, (16) five or more. The date of the last study completed determined the recency of experience, and was evaluated as follows: (0) 1955 or before, (2) 1955-60, (4) 1961-65. Only two categories of respondents were identified on research experience. "Adequate" was defined as respondents with a total amount and recency score of 10-20; "inadequate" had a total score of 9 or less.

No attempt was made to combine the evaluations of academic preparation and research experience. Since no data were collected concerning the nature or quality of the research experience, it was assumed that academic preparation would provide the primary basis for evaluating competence to conduct experimental research. Research experience could then be used as supplemental information. As questionnaires were received responses were converted to numerical values, and recorded on a summary card color coded by area of specialization.

Findings

The findings are presented in terms of the objectives stated above.

> Objective 1: Who are the persons in the population that are interested in conducting research and/or in acquiring further research training in occupational education?

Table 1 contains a summary of the questionnaire returns classified according to expressed research interests by areas of specialization.

Four hundred fifty four people, or 8.2% of the total population, expressed an interest in research. Of this group, 9.7% were interested in only conducting research, 11% in only acquiring research training and 79.3% in both conducting research and acquiring further research training.

> Objective 2: Is there a sufficient number of persons in the population interested in acquiring further research training to justify the establishment of an institute for occupational education research?

Since 360 people indicated an interest in both conducting research and acquiring further training and 50 persons indicated an interest in only acquiring further training, a total of 410 persons in the State expressed a desire to receive additional research training. This appears to be a sufficient number to warrant the establishment of a research training institute.[1]

---

[1]A seven week institute in occupational education research sponsored by the U.S. Office of Education was conducted by the Unit during the 1966 summer session. Eighty applications were received from the 410 persons identified in the study.

Table 1

NUMBERS AND PERCENTS OF PERSONS EXPRESSING AN INTEREST IN CONDUCTING RESEARCH AND/OR ACQUIRING FURTHER RESEARCH TRAINING BY AREA OF SPECIALIZATION

Area of Specialization	No. Sent	No. Returns	% of Returns	Conduct		Acquire Training		Both	
				No.	%	No.	%	No.	%
Administration and Miscellaneous	472	32	6.8	6	18.8	2	6.2	24	75.0
Agricultural Education	380	55	14.5	5	9.1	6	10.9	44	80.0
Business and Distributive Education	1455	81	5.6	6	7.4	11	13.6	64	79.0
Guidance	687	109	15.9	10	9.2	9	8.2	90	82.6
Home Economics Education	963	31	3.2	0	0	5	16.1	26	83.9
Industrial Arts Education	1188	126	10.6	15	11.9	13	10.3	98	77.8
Trade and Industrial Education	396	20	5.1	2	10.0	4	20.0	14	70.0
OVERALL TOTAL	5541	454	8.2	44	9.7	50	11	360	79.3

Objective 3: What are the research competencies of those persons in the population expressing an interest in conducting research and/or in acquiring further training?

In Table 2, the numerically weighted responses to the research competency items are combined and related to area of specialization.

The sum of percentages of columns A, B, and C indicates that about 48% of the respondents have adequate research experience, and that about 52% have inadequate research experience.

The sums of total percentages in column A and D, B and E, and C and F reveal that approximately 7% have adequate academic preparation, 34% limited preparation, and 59% inadequate preparation, respectively.

Conclusions

1. The individuals completing and returning the post card questionnaire have expressed their interest in conducting research and/or in acquiring further research training in occupational education. The limited number of responses, however, indicates that persons related to occupational education in Minnesota are generally not strongly motivated to participate in research activities. Among the various areas of specialization within occupational education, the greatest numbers of interested individuals are in industrial arts, guidance, and business and distributive education.

2. The numbers of persons expressing a desire to acquire further research training appears to justify an attempt to provide a research training institute in occupational education.

3. Most of the persons expressing an interest in occupational education research lack the academic preparation judged necessary to conduct useful experimental studies. The most fruitful source of interested competent researchers is now in the area of guidance.

CHAPTER II

THE SECOND SURVEY

The Problem

The principal purpose of the second survey was to determine the attitudes of educational administrators in the State toward occupational education research in general, and more specifically, toward their own staff's actual involvement in it. Since an actual administrative decision to approve the conduct of a study is a function of particular modifying conditions as well as attitude toward research, the survey assessed problems perceived by administrators in their respective institutions for the conduct of research. These problems were then related to size of school and the administrative position of the respondent.

Objectives

The three major questions to be answered by the study were:

1. Who are the educational administrators in the State who have supportive attitudes toward occupational education research in general, and more specifically, toward their own staff's involvement in it?

2. What are the problems the supportive attitude administrators perceive as barriers to the conduct of occupational education research in their schools or school system?

3. Is there a relationship between the perceived problems identified above, the supportive administrator's position, and size of school?

Methodology

Population: The population consisted of all the a) superintendents of public school districts, b) principals of public junior and senior high schools, c) deans and heads of departments related to occupational education in the University, junior colleges, state colleges, and private colleges, and d) directors of public and private vocational-technical schools in the State of Minnesota during the 1965-66 academic year.

The Questionnaire: Administrators' attitudes toward research and the problems they perceived in conducting studies in their schools were elicited by a printed post card questionnaire (Appendix B).

Four selection type items determined the respondent's positive or negative attitudes toward research in general, occupational education research, and their own staff's involvement in either the conduct of or training for occupational education research. Four additional selection and one supply item were used to determine administrative reasons for not giving complete encouragement to proposed research projects. The selection items dealt with staff availability of local project support while the supply item permitted the addition of other perceived problems. Information concerning the respondent's administrative position and the type and size of his school was also secured by the questionnaire.

Procedures: The printed post card questionnaire was mailed to the total population together with a printed two-color brochure entitled, "Funds Available for Research in Occupational Education." The brochure announced the establishment of the Minnesota Research Coordination Unit in Occupational Education and outlined the availability of government research funds and the procedures to be used in applying for them. The scope of occupational education research was described in the brochure as "...projects designed to help present and prospective members of the labor force acquire the knowledge, skills, and characteristics necessary to contribute to the nation's economic progress." At intervals of approximately four weeks, two follow-up letters were mailed to non-respondents. The completed returned questionnaires were coded for administrative position, school district, size of school[2], and perceived problem categories.

Analysis: The chi-square statistic at the specified .05 level of significance was used to test for relationships between the problems perceived by administrators, their positions, and the size of their schools. Since the chi-square statistic is most reliable with a minimum frequency of five cases per cell, many potential relationships were not tested; type of school was among those variables excluded because of this limitation.

Findings

The findings are presented in terms of the objectives.

> Objective 1: Who are the educational administrators in the State who have supportive attitudes toward occupational education research in general, and more specifically, toward their own staff's involvement in it?

---

[2](1) 1-99 students; (2) 100-199 students; (3) 200-499 students; (4) 500-999 students; (5) 1000-1999 students; (6) 2000-4999 students; (7) 5000-9999 students; (8) 10,000 and over.

Table 3

ADMINISTRATIVE POPULATION, RESPONSE RATES, AND PERCENTS OF RESPONDENTS WITH SUPPORTIVE ATTITUDES TOWARD VARIOUS ASPECTS OF RESEARCH

Administrative Position	Population	Responses		Percents of Respondents with Supportive Attitudes Toward:							
				Educational Research		Research in Occup. Educ.		Staff Participation in Occup. Education Research		Staff Participation in Training for Occup. Ed. Research	
		No.	%	No.	%	No.	%	No.	%	No.	%
Superintendents	347	265	76.4	265	100.0	265	100.0	258	97.4	255	96.2
Principals and Directors	765	356	46.5	355	99.7	355	99.7	350	98.6	344	96.7
Deans and Department Head	74	27	36.5	27	100.0	27	100.0	24	88.9	20	74.1
TOTAL	1186	648	54.6	647	99.8	647	99.8	632	97.5	619	95.5

The population is presented in Table 3 by administrative position, response rates to the questionnaire, and percents of respondents with expressed supportive attitudes toward various aspects of research. The 54.6% of administrators who responded to the questionnaire were overwhelmingly in favor of educational research, research in occupational education, and their own staff's participation in occupational education research and research training. It is likely, however, that the 45.4% of non-responding administrators were less favorably disposed toward research.

Objective 2: What are the problems supportive attitude administrators perceive as barriers to the conduct of occupational education research in their schools or school systems?

Table 4 shows the numbers and percents of supportive attitude administrators, by position, who felt their institutions would encounter certain problems in initiating occupational education research.

Table 4

NUMBERS AND PERCENTS OF SUPPORTIVE ATTITUDE ADMINISTRATORS EXPRESSING VARIOUS PROBLEMS IN INITIATING RESEARCH

(N=648)

Administrative Position	Staff Qualifications		Staff Availability		Use of School Facilities		Admin. of Project Funds		Availabili of Project Support	
	No.	%	No.	%	No.	%	No.	%	No.	%
Superintendents (265)	16	6.0	24	9	2	.8	10	3.8	100	37.7
Principals and Directors (356)	8	2.2	32	8.9	0	0	24	5.6	118	33.0
Deans and Department Heads (27)	0	0	4	14.8	0	0	3	11.1	6	22.2
TOTAL	24	3.7	60	9.3	2	.3	37	5.7	224	34.5

The most serious obstacle to the initiation of occupational education research, in the minds of administrators with supportive research attitudes, is securing local contributions for the support of the project. It is possible that this perception may be changed if made available to them.

<u>Objective 3</u>: Is there a relationship between the perceived problems identified, the supportive administrator's position, and size of school?

Table 5 gives the response frequencies of the supportive administrators categorized by administrative position and their three greatest perceived problems--staff availability, administering project funds, and the availability of local project support. Because of insufficient expected frequencies, the administrative positions of Deans and Department Heads have been combined with Principals and Directors.

Table 5

RESPONSE FREQUENCIES OF SUPPORTIVE ADMINISTRATORS BY ADMINISTRATIVE POSITION, PROBLEMS IN INITIATING RESEARCH

	Staff Availability		Administering Project Funds		Availability of Local Project Support	
Responses	Superintendents	Principals, Directors, Deans and Dept. Heads	Superintendents	Principals Directors, Deans and Dept. Heads	Superintendents	Principals Directors, Deans and Dept. Head
A Problem	24	36	10	27	100	124
No Problem	241	347	242	259	134	145
No Response	-	-	13	97	31	114

Application of the chi-square statistic reveals no relationship between administrative position and the administrators perception of whether or not staff availability (time) is a problem in initiating research (χ^2 = .02, P = .90). Even though there is no significant relationship between the superintendent group and the principal, director, dean and department head group, they agreed upon the extent of the problem. On the other hand, there are significant relationships between administrative position and the three categories of administrator responses to perceived problems of administering project funds and availability of local support. (χ^2 = 52.8, P = .001, χ^2 = 30.0, P = .01). These findings seem to indicate that superintendents tend to respond more frequently to financial administrative questionnaire items than principals, et. al., which might logically be expected because of their financial duties and

501 of 66

responsibilities. Because it appeared that the chi-square calculations were unduly weighted by the "no response" frequency, separate calculations were necessary to assess the extent of relationship of only those who responded. There is a significant relationship between the administrative groups in their assessment of problems involved in administering project funds ($\chi^2 = 6.26$, $P = .02$). Probably because of the nature of their duties and responsibilities the superintendents may be more aware of the mechanics of administering project funds, thus, they do not foresee this as a critical problem for initiating research. On the other hand there was no significant relationship between tne two administrative groups on their perception of the problem of availability of local support for research projects. ($\chi^2 = .46$, $P = .50$). This finding seems to indicate that administrators in general, are not certain that local support for research projects can be made available, thus, they tend to agree that this is a problem for initiating research.

Tables 6, 7, and 8 present the frequencies of supportive administrator's responses categorized by size of school and according to their perceptions of the staff availability, administering project funds, and availability of local project support problems. Categories of school size have been combined where necessary to yield a minimum expected frequency of five per cell.

Table 6

RESPONSE FREQUENCIES OF SUPPORTIVE ADMINISTRATORS
BY SCHOOL SIZE TO THE PROBLEM OF STAFF AVAILABILITY

Response	School Size					
	0-99	100-199	200-499	500-999	1000-1999	2000 and over
A Problem	5	9	23	11	7	5
No Problem	19	90	229	129	79	42
No Response	-	-	-	-	-	-

Table 7

RESPONSE FREQUENCIES OF SUPPORTIVE ADMINISTRATORS BY SCHOOL SIZE TO THE PROBLEM OF ADMINISTERING PROJECT FUNDS

Response	School Size			
	0-199	200-499	500-999	1000 and over
A Problem	7	17	6	7
No Problem	95	201	109	96
No Response	21	34	25	30

Table 8

RESPONSE FREQUENCIES OF SUPPORTIVE ADMINISTRATORS BY SCHOOL SIZE TO THE PROBLEM OF AVAILABILITY OF LOCAL PROJECT SUPPORT

Response	School Size				
	0-199	200-499	500-999	1000-1999	2000 and over
A Problem	52	104	36	12	10
No Problem	53	113	f54	42	27
No Response	18	35	50	32	10

The chi-square test revealed no relationship between school size and the administrators' responses to the perceived problems of staff availability or the administration of project funds (χ^2 = 6.0, P = .50, χ^2 = 3.4, P = .80). There is, however, significant relationship between school size and the perceived problem of availability of project support (χ^2 = 61.6, P = .01). Administrators in schools with less than 500 students perceive a more definite local support problem than administrators in schools with 500 or more pupils; the latter group is less certain that support will be a real problem.

Conclusions

The following conclusions are limited to the State of Minnesota:

1. Approximately 54% of the educational administrators in the State may be considered to have "supportive" attitudes toward research in occupational education and their own staff's participation in occupational education research and research training activities. The remaining 46% of administrators have questionable attitudes towards this type of staff activity.

2. Administrators with supportive attitudes presently perceive the availability of local support as the major obstacle for initiating occupational education research projects in their schools. Other perceived problems do not appear to be critical.

3. Superintendents seem more willing to make judgments and respond more frequently to questions concerning the potential financial policy problems of administering project funds and availability of local support for projects than does the combined group of principals, directors, deans and department heads. Superintendents also tend to be more optimistic about the problem of administering project funds. However, both groups tend to agree that obtaining local project support constitutes a problem. Administrators of schools with enrollments of less than 500 appear more definite in their perception of a local support problem than are administrators of schools with larger enrollments.

CHAPTER III

IMPLICATIONS

By combining the results of both surveys, the Unit has identified individuals with an interest in research and research training, as well as the attitudes and perceived problems of their administrators toward their participation in research activities. For the purposes of making future stimulation efforts more effective, the Unit may now encourage certain persons to engage in particular types of studies, and provide relevant research training programs for others. The Unit may now also proceed with attempts to change attitudes toward research and to supply individuals with information that will dispel misconceptions about research requirements. Specifically, the Unit should:

1. Meet with individuals identified as "competent" researchers with supportive administrators for the purpose of involving them in the conduct of research studies.

2. Provide research training institutes, fellowships, etc. for interested individuals who can benefit from them.

3. Supply administrators with information about the methods and requirements for securing research funds and contributing partial local support.

4. Engage in studies to discover feasible means for increasing interest in occupational education research among educational personnel in the State.

Nebraska,

The major purpose of the seminar was to provide an opportunity for state leaders to cooperatively formulate plans for initiating and improving state research and development programs. Attending were 68 state and national leaders in agricultural education, vocational education and supporting disciplines from 31 states. They considered the state leadership role in -- (1) research and development program planning, (2) outside resource utilization, (3) pilot program planning, conduct, and evaluation, (4) new program adoption, (5) fund source identification, and (6) regional research program review and plans. Presentations included -- "The Need for State Programs of Research and Development," by R. E. Taylor, "Developing Comprehensive State Programs of Research and Development," by Lloyd J. Phipps, "Utilizing Outside Resources in Research and Development," by O. E. Thompson, "Opportunities and Responsibilities for Research and Development," by Duane Nielsen, "Developing Proposals for Funding Research and Development Projects," by John Caster, "Are We Asking the Right Question," by L. PROGRAM DEVELOPMENT AND RESEARCH

AUGUST 9 TO 13, 1965

The Center for Vocational and Technical Education
The Ohio State University
Columbus

VT 01098

The Center for Vocational and Technical Education has been established as an independent unit on The Ohio State University campus with a grant from the Division of Adult and Vocational Research, U. S. Office of Education. It serves a catalytic role in establishing a consortium to focus on relevant problems in vocational and technical education. The Center is comprehensive in its commitment and responsibility, multidisciplinary in its approach, and interinstitutional in its program.

The major objectives of The Center follow:

1. To provide continuing reappraisal of the role and function of vocational and technical education in our democratic society;

2. To stimulate and strengthen state, regional, and national programs of applied research and development directed toward the solution of pressing problems in vocational and technical education;

3. To encourage the development of research to improve vocational and technical education in institutions of higher education and other appropriate settings;

4. To conduct research studies directed toward the development of new knowledge and new applications of existing knowledge in vocational and technical education;

5. To upgrade vocational education leadership (state supervisors, teacher educators, research specialists, and others) through an advanced study and in-service education program;

6. To provide a national information retrieval, storage, and dissemination system for vocational and technical education linked with the Educational Research Information Center located in the U. S. Office of Education;

7. To provide educational opportunities for individuals contemplating foreign assignments and for leaders from other countries responsible for leadership in vocational and technical education.

PREFACE

It has been said that there never was a better climate or greater urgency for replanning programs of agricultural education. The new Vocational Education Act, with funds for both program development and research, gives emphasis to the need for state leadership to carefully plan comprehensive, continuing state programs of research and development.

Relative success in these areas will be determined in large measure by the quality of long-range planning and leadership exerted by state staffs. State programs of research and development should be initiated to evaluate present efforts, to stimulate the improvement and extension of agricultural education, and to provide a systematic means of developing and refining promising program innovations. We are concerned not only with identifying more efficient and effective ways of serving agricultural education needs, but also with increasing our effectiveness as state leaders in accelerating the adoption of improved programs.

The major purpose of the seminar was to provide an opportunity for state leaders in vocational agriculture and vocational education to pool their resources and thinking in formulating plans for initiating and improving state programs of research and development.

During the seminar, participants addressed themselves to such key questions as the leadership role of state staffs in:

1. Developing plans for comprehensive, continuing state programs of research and development;

2. Utilizing outside resources to assist in program development and research;

3. Planning, conducting, and evaluating pilot programs;

4. Facilitating the adoption of new programs in agricultural education;

5. Identifying sources of funds for program development and research activities;

6. Reviewing and planning regional research programs.

For a more detailed overview of the seminar purposes and setting in which these purposes were implemented, the reader is referred to the presentation, "The Need for State Programs of Research and Development."

Over 68 state and national leaders in agricultural education, vocational education and supporting disciplines representing 31 states met at The Center, August 9 to 13, to focus on their responsibilities in providing leadership to state program development and research.

In reflecting on the seminar, the discussions were characterized by a positive, stimulating spirit of free inquiry. Traditional practices and concepts were questioned and re-evaluated in light of present or future circumstances. The seminar did not attempt to develop policies or establish definite guidelines for program development and research, but, rather, examined alternative approaches. The presentations of the consultant staff constituted the point of departure and framework for the major thoughts introduced for discussion. They should have continuing value to state staffs, graduate students and others as they continue their efforts in this area.

As would be expected in meetings of this nature, the major benefits were derived by the participants as they shared ideas, raised questions, acquired new insights, and broadened and extended their concepts and understandings of state programs of development and research. We believe the interest and enthusiasm kindled during these sessions will spark new interests and thrusts in the states represented at the seminar.

As seminar director, I would like to express my appreciation to the participants for the enthusiasm and cooperation they exhibited throughout the week. Acknowledgement is also due the consultant staff who, through their forward-looking and thought-provoking presentations, added an immeasurable dimension to our deliberations. Mr. Sidney S. Sutherland, Professor Emeritus, University of California at Davis, who served as coordinator-director; Mr. James E. Christiansen and Mr. Robert V. Kerwood, Research Associates at The Center, also merit our thanks for their splendid work during the seminar.

Agricultural education, vocational education, and The Center acknowledge their appreciation to the SEARS-ROEBUCK FOUNDATION for underwriting the expenses of the seminar.

Robert E. Taylor
Director

An outstanding group of national consultants made presentations during the seminar. A question and discussion period followed each presentation. Here, S. S. Sutherland, Emeritus Professor, Department of Agricultural Education, University of California, is awaiting questions from the group concerning, "Developing Comprehensive State Programs of Research and Development," a presentation by Lloyd J. Phipps, Chairman, Department of Agricultural Education, University of Illinois.

PART I

SEMINAR GUIDELINES

THE NEED FOR STATE PROGRAMS OF RESEARCH AND DEVELOPMENT

by
Robert E. Taylor, Director
The Center for Research and Leadership Development
in Vocational and Technical Education
The Ohio State University

In setting the stage for our week's activities I would like to do four things:

1. Review briefly the setting and circumstances which contribute to the rationale for this specific seminar on program development and research;

2. Highlight briefly some limitations and continuing problems in our state research and development programs; in short, present a cursory review of the "state of the art";

3. Look at some of the major concerns in this area as we move ahead in expanding and improving our research and development activities;

4. Overview the organizational structure of this seminar, our purposes, and the manner in which we will address ourselves to these problems and opportunities.

As I have mentioned earlier in other meetings, the focus of this seminar, program development and research, was one of several priority areas identified by The Center Advisory Committee as needing primary emphasis and leadership from The Center during the year. I am sure we can readily see and appreciate some of the factors that contributed to their recommendation.

Through the Vocational Education Act and other federal and private funding sources, we have witnessed a tremendous expansion and development of vocational and technical education programs. Concurrent with this development, we are constantly confronted with the need for improving the quality and quantity of our research efforts as a means of providing a constant "growing edge" of knowledge and practice. We also are aware of other educational innovations and program developments that need rapid dissemination, diffusion, and adoption by the "establishment". In short, we appear to be on the threshold of a "new era" in research and development in vocational and technical education.

The ten percent of the Vocational Education Act funds set aside under Section 4(c) for research and training and experimental, developmental, or pilot programs provides considerable thrust and impetus to this area. Through the 4(a) funds to the states and other sources of state fundings, research and development programs are being given additional prominence and support.

The approval of 24 state research coordination units in vocational education to be funded at approximately the $100,000 level not only gives additional emphasis and leadership to research and development in vocational education broadly but promises to be the forerunner of state organizational structure, coordination, and planning. We could safely conclude that research and development in our field are literally exploding; that it is feast after famine, the flood following the long drought.

It doesn't seem unreasonable to ask, "Are we equal to the task? Do we have the research and development capacity, the leadership ability to effectively plan, initiate, and conduct comprehensive continuing state programs of research and development?" The challenge to improve the quality and quantity of our efforts in this area gives rise to questions relating to organizational structure, planning and coordination, funding, relationships, involvement of other disciplines and agencies, and so on.

Before we move further in this area, it seems appropriate to review some of our past efforts. Let's look rather quickly at some of the problems or limitations in our current research efforts which restrict our improving the effectiveness of our research and development efforts. In my judgment, these problems and limitations are not unique to agricultural education or vocational education. They are not sharp and discrete items but complex and interrelated ones. They may well be syndromes. Furthermore, I am not saying they exist in all of your states (or in any of them, for that matter), but based on experience and observation, they seem to apply broadly. Think about them. Determine if they have implications for our discussion this week, for your situation.

The first syndrome is the widespread misunderstanding of research--what it is, how it functions, what it can do, what it cannot do. Many fail to appreciate the full implications of the research and development process. In many instances we have failed to recognize that research and development encompass a wide range and level of activities--problem identification, design, basic research, development, field testing, and dissemination, to mention a few. There are several steps in the complete process and in many instances we have not included these essential steps; hence, we have become prematurely disenchanted or have condemned research broadly. Perhaps we have failed to properly appreciate what is involved in moving from research design to action programs.

There are some indications that program administrators have expected research to provide "spot answers"; hoping that research could remove their burden of decision-making; hoping that research could take away all doubt or risk of failure.

In other quarters research is viewed as a requirement, rather than a valuable procedure for program improvement and development. Some individuals frequently do not see research as a "working tool". There are also indications that some groups look upon research as their "private domain" and protect it

jealously. Conversely, we see other personnel in the total program shirking their responsibilities in this area and assuming no responsibilities for research and development.

Another apparent widespread limitation is failure to recognize the dymanics, the climate which research must have to properly function. We fail to appreciate the need for a continuous, sustained, adequately supported research effort to build up capacity in this area. Too often we wait until our "britches are on fire" and then turn to research to "put out the flame". Not only is it too late but the capacity frequently is not there. It has been starved from a lack of attention and funds.

Perhaps we have too much fear of failure. We seem to expect that all research will pay off big; perhaps if not immediately, then certainly just a little later. We have failed to recognize that knowledge accumulates slowly and that the major breakthrough is the exception rather than the rule. Even then it is probably the result of continuous, sustained, additive research efforts in the area. We cannot expect every study to be an educational penicillin or a pedagogical Salk vaccine. To know what will not work is also of value.

Another major cluster of problems and limitations restricting our research and development efforts is that frequently the wrong people are doing research. A majority of research in agricultural education has been conducted by graduate students who, at best, are interns, not qualified researchers. In addition to limitations of methodology, there are frequently limitations of problem selection. In too many instances problems selected are out of the main stream, concentrated on the past rather than the future, and not significant in terms of their implications for state-wide programs of agricultural education. They are not coordinated with other studies and usually do not contribute to an organized body of knowledge. They do not hook up or add up. They have low generalizability, both from the standpoint of problem setting and research procedures. They provide little help in projecting and improving state programs.

If even a portion of these statements are valid, they should convince us that we can no longer rely solely on graduate students for our research programs. We frequently decry low utilization of research. What can be done to make teachers and other practitioners more intelligent consumers of research, to have them more appreciative of the role of research and development activities in improving and extending our educational services to the broad agricultural industry?

Our past research efforts have been marked by a lack of interdisciplinary and team research. We have failed to reach out and successfully utilize the capacities and talents of researchers in other areas of vocational education and supporting disciplines.

Another aspect of this syndrome of the wrong people conducting research is the time restrictions on our senior staff. Perhaps we have not adequately

explored the possibilities of experiment station appointments, of affiliation with and support from college of education research bureaus. We need to secure vocational education funds to establish and maintain definite budgets for research. ("Hard money" is needed in addition to the "quick silver" of proposals and special project funding.) We need more people devoting a majority of their time to research. In this connection, we may have proliferated or "frittered away" our existing research capacity by assigning one-eighth or one-fourth time for research to several staff people. Such small-time allotments are difficult to protect and usually do not yield significant research results. We may need to concentrate our efforts and perhaps rotate research assignments among staff.

Then, too, I would like to raise the question of how many of us who talk about research are really interested in conducting research and development activities, or are we more interested in teaching? Perhaps we will need to give more attention to identifying research talent in our future personnel selections.

Another problem area, it seems to me, is that we may not have involved decision-makers in our research efforts. In many instances we have failed to incorporate one of the basic values of action research in our programs. I refer to the principle of involvement. When we have been able to develop something through research that has had state-wide implications, we have not, in many instances, been able to fit it into the administrative framework for dissemination and implementation.

Experiences also would seem to reveal that we have not given enough attention to coordinating research projects across state lines, that more massive and global confrontations of priority problems through research are needed and feasible.

The foregoing enumeration was not intended to be exhaustive but rather to point our thinking toward some of the basic difficulties and limitations as we focus on organizing for continuing state programs of research and development. I am sure you will think of other problems and limitations that restrict our state-wide research efforts. In any event, we don't need to identify other problems to indicate that this seminar is needed.

I believe it also appropriate to observe that we see many vigorous seeds of change and improvement in many of these problem areas. I am optimistic concerning pending developments in this area.

We too long have viewed research in a narrow and restricted context in relation to state programs of vocational agriculture. We have tended to see it as limited to graduate degree work, as a formal, ritualistic activity outside the main stream of program development and operation rather than as a solid base for program development, improvement, and projection, as a basis for direction finding.

In contrast, industry has long followed the pattern of trying to make its present products obsolete. Education has not. We frequently try to prove that what we are doing is right rather than devise means of improving what

we are or ought to be doing. I submit that organizing for research is educational leadership; that it is program planning in its broad context. No longer can we afford the luxury of an anemic, isolated, undernourished research and development effort. A broad, comprehensive, organized state research program may well be the heart of state programs in the future.

If we were to try to synthesize the foregoing problems and limitations into a single global problem, we might identify it as the absence of planned state programs of research. We need in each state comprehensive, planned, purposeful means--an organizational structure--for renewing vocational agriculture. We need a division for re-evolution, a section for research and development, a systematic procedure for innovation; not a slipshod, Scotch-tape, chewing gum program. We cannot leave such a vital development to accident or fortuitous circumstances. We must have a carefully conceived, deliberate mechanism built into and coordinated with the state administrative organizational structure of vocational agriculture and vocational education. This mechanism must provide for the several steps in the research and development process. We need a mechanism that will do for agricultural education what the experiment station and extension service have done for agricultural science and technology.

In establishing this structure we need to consider providing a mechanism for:

1. Identifying significant problems.

2. Assigning priorities.

3. Amassing needed resources and personnel (not bootlegging).

4. Evaluating research findings in terms of their implications for state-wide dissemination.

5. Providing for the complete spectrum of needs in research and development (problem identification, design, basic research, development, field testing, and dissemination).

6. Demonstrating promising innovations. We have lost sight of the word "promote" in vocational agriculture. We must recognize what it takes to effect change; concentrate our resources on significant efforts.

7. Coordinating research efforts with other groups in agricultural education, vocational education, and education; within the state and beyond as well (regional projects).

8. Building into the mechanism the team approach to research.

As we approach this needed development we must also give attention to such essentials as:

1. Selecting and developing researchers (specialists).

2. Building into state plans permissive policies and procedures for research and development, freedom for experimentation.

3. Reviewing relationships (supervisors, teacher educators, teachers, vocational educators, experiment stations, educational research bureaus, research coordination units, state departments of education, etc.).

4. Identifying funds. We need to take money off the top for this basic need. What is educationally sound is administratively feasible.

The fundamental problem is: How should agricultural education organize itself on a state-wide basis to effectively meet its responsibilities and opportunities in research and development? How can we systematically and deliberately make agricultural education and vocational education self-renewing? We recognize the urgency of the task. We believe we can make a strong case for an organized approach in terms of its efficiency and effectiveness. Perhaps even more important, what progress can we make here this week in addressing ourselves to this critical problem of planning for comprehensive, continuing state programs of research and development? How can we effectively utilize outside resources to assist in program development and research? What is the leadership role of state staffs in planning, conducting, and evaluating pilot programs? How can state staff members facilitate the adoption of new programs in agricultural education? How can we accelerate the change process? How can we successfully identify and secure sources of funds for program development and research activities? These are some of the primary concerns of the seminar. These are the areas to which we want to address ourselves during the week. These appear to be the major areas that will provide the most help to state staffs in developing long-range programs of research and development.

How, then, do we proceed to maximize the potential benefits from this seminar to your respective states and to improve programs of research and development broadly? First, we want to emphasize the need for and values of your participation. The experiences and insights of eighty people with extensive and diverse backgrounds from thirty-five states constitute a rich resource. We encourage; we want; yes, even require, your best thinking and participation. Everyone's ideas are important, regardless of position. Irregardless of the size of your state program, whether or not you have previously been involved in research and development, your years of experience notwithstanding, we want your ideas and questions. Hopefully, we will have active participants, not passive observers.

You will note that the seminar is structured to provide you with the opportunity to raise questions with members of the consultant staff. We are proud of the consultant staff that has been assembled for this seminar. We

believe their unique experiences, coupled with the advanced thought and preparation they have given these problems, will yield real dividends during the week. They have been asked to react to key questions. We hope that you will raise probing, searching questions with these consultants to "tease out" the various alternatives and situational factors inherent in this critical area.

Mr. S. S. Sutherland will be serving as coordinator of the seminar. I am sure that his masterful touch in group processes and his keen insight into the problems underlying this seminar will further contribute to our deliberations and accomplishments.

Further, may I emphasize that this seminar is not a policy-developing or action organization. It is primarily a study group. The outcomes of the seminar will be guides to individuals and states who are free to accept or reject suggestions as they deem appropriate. I would express the hope that we can operate in a spirit of openmindedness, in a free and permissive climate that will permit honest expressions and differences of opinion; that we will set our sights high in terms of quality and standards, focusing on what ought to be rather than merely perpetuating or protecting what we have. I hope, too, that we will recognize and accept our responsibilities as state staff to give the leadership needed for desired changes, redirection, and extensions in agricultural education through carefully conceived and executed programs of research and development.

As we think through our responsibilities in this area, I hope that we can continually be aware of the need for and opportunities to involve and work with representatives of other vocational services and supporting disciplines.

While it may be premature at this point to suggest specific follow-ups for this meeting, it, nevertheless, seems appropriate to at least call your attention to some possibilities at this stage.

1. Report on this seminar to your fellow staff members upon your return to your home state.

2. Review the implications of this seminar for your state. Identify priorities, determine responsibilities, and provide leadership in developing comprehensive, long-range state programs of research and development.

3. Consider a state seminar on this topic, involving appropriate educational, agricultural, and vocational education leaders.

4. Resolve to participate in future Center programs; follow up activities of this seminar.

5. Provide a feed-back to the Center. Keep us posted on developments, activities, and progress in implementing some of the seminar outcomes. Give us your suggestions concerning ways and means The Center can further assist you in this area.

In summary, we have the prospects of a stimulating and rewarding experience during the next week. The essential ingredients are here. We have an urgent task, common concerns, a rich background of experience, an outstanding consultant staff, a favorable climate, and, we hope, an appropriate setting for effective group effort here at The Center. Let's make the most of it.

PART II

PRESENTATIONS

BY THE

CONSULTANT STAFF

Maximum interaction for seminar participants was provided by group discussion meetings. Shown here is a discussion group being led by Dr. Ray Cardozier (center, rear row, bow tie), Head, Agricultural and Extension Education, University of Maryland. Consultants shown with the group are: Dr. Duane M. Nielsen (front row, second from left), Director, Educational Resources Development Branch, U. S. Office of Education: George L. O'Kelley, Jr. (front row, fourth from left), Professor, Department of Agricultural Education, University of Georgia; and John K. Coster (left center, rear row, checked jacket), Professor, Department of Agricultural Education, University of Nebraska.

Mr. Neville Hunsicker, Head, Agricultural Education Occupations Branch, U. S. Office of Education, addressed a luncheon meeting of the seminar group. His topic was, "Priority Areas for Program Development in Agricultural Education." Seated at the head table (left to right) are: John T. Mount, Vice President for Educational Services, The Ohio State University; R. V. Mullen, Director, Youth and Rural Programs, Sears-Roebuck Foundation, Chicago, Illinois; Robert E. Taylor, Director, The Center for Research and Leadership Development in Vocational and Technical Education.

DEVELOPING COMPREHENSIVE STATE PROGRAMS OF RESEARCH AND DEVELOPMENT

by
Lloyd J. Phipps
Chairman, Department of Agricultural Education
University of Illinois

Situation

We are entering a "golden age" of vocational and technical education. Whether or not we in agricultural education participate in this "golden age" and serve the welfare of mankind, as we can serve and as we should serve, will depend on our ability, foresight and imagination in research and development.

The President's Panel on Vocational Education gave agriculture educators and other vocational educators a mandate to research, develop and evaluate their programs. Because of the unfavorable image of agriculture, the Panel, in my opinion, was especially emphatic regarding the necessity to research, develop and evaluate the program in agricultural education. Congress legitimized the mandate of the President's Panel through the Vocational Education Act of 1963 and emphasized in the Act the necessity for research, development and evaluation in agricultural education. Congress has given unparalleled and unequaled opportunities for research, development and evaluation of agricultural education by providing unprecedented amounts of monies for these activities in the Vocational Education Act of 1963, in other public school legislation and in such legislation as The Economic Opportunity Act. They have even earmarked vast sums for research and development in a period when there is a trend away from earmarked funds in Federal assistance programs for education.

Why do we have this sudden and unprecedented interest in research and development, including evaluation, in vocational education? Changes in America have created some compelling reasons. We in education may not be fully cognizant of the changes in the employment situation that are impinging on our society. We in agricultural education have been acutely aware for some time of the effect of automation in farming upon the manpower needs for production. We and other vocational educators, however, may not be fully acquainted with the growing impact of automation on all types of production. If we have been aware of the impacts of automation on nonfarm production, it is doubtful that we have been fully aware of their implications for agricultural education. Changes in nonagricultural manpower requirements in reality will create many opportunities for new educational services in agriculture and it has opened a "Pandora's Box" of demands and opportunities for research, development and evaluation in agricultural education.

Let us take a closer look at the present and emerging manpower situation in America and its implications for agricultural education

and for research, development and evaluation in agricultural education. Grant Venn says,

"The impact of automation on the labor market has been profound. Automatic elevators have recently displaced 40,000 elevator operators in New York City alone. New equipment in the Census Bureau enabled 50 statisticians to do the work in 1960 that required 4,000 such people in 1950. The check-writing staff in the Treasury Department has been reduced from 400 people to four. The airline flight engineer and the railroad fireman may soon disappear completely. Thirty thousand packing-house workers have been automated out of their jobs in the past few years. Enormous machines have helped reduce employment in the coal fields from 415,000 in 1950 to 136,000 in 1962. While construction work has leaped 32 percent since 1956, construction jobs have shown a 24 percent decline."

W. H. Ferry, Vice-President of the Fund for the Republic, says,

"The unemployed and under-employed are no longer almost exclusively the unskilled, the recent immigrants, the colored, and the groups at the end of the economic scale who have customarily borne the heaviest weight of economic slides. White-collar workers are joining this group as automation reaches the office. There is some reason for thinking that white-collar workers will after a few years comprise most of the growing category of technologically displaced. Herbert Simon has observed that by 1985 machines can do away with all of middle management, if Americans want it that way."

Ralph Bellman, a computer expert for the Rand Corporation, says,

"Industrial automation has reached the point of no return. The scientific knowledge to automate American industry almost completely is already available and is certain to be used. Banks could cut their staffs in half easily by further automation; the steel and automotive industries could increase their use of automation a hundredfold. Lower and middle management as well as production workers will be displaced for there will be no need for decision-making at that level. Unemployment resulting from automation would be greater right now except that many industries are holding back--at a sacrifice to their profits to avoid increasing the severity of the problem. Self-restraint on the part of industries cannot continue indefinitely. Automation itself will produce few jobs. Two percent of the population will in the discernible future be able to produce all the goods needed to feed, clothe, and run our society."

If the statement that misery loves company is true, we in agricultural education should be in very "loving company" with all other vocational educators in the next few decades. Some agricultural educators in the past decade have developed inferiority feelings because they were engaged in an educational field with rapidly shrinking job opportunities in farming. The recent studies identifying job opportunities requiring agricultural education in areas serving farming have

increased morale and our feeling of worth materially. We cannot rest on our laurels, however, because many of these jobs will also disappear with automation.

Gordon Swanson, Professor of Agricultural Education and President of Phi Delta Kappa, made, in my opinion, a very cogent statement in the April issue of the "Phi Delta Kappan." He said that in the future vocational educators should not be content with preparing persons to fill jobs; they should create job opportunities. I assume that he meant that we can create job opportunities by preparing persons for jobs that do not now exist and by helping these persons to develop and obtain employment in these areas.

In planning comprehensive research and development programs in agricultural education to adjust, along with other vocational fields, to the changing manpower requirements of America, we should also be cognizant of the new look in vocational education resulting from recent legislation.

1. At present and in the future various teachers in other vocational fields and even nonschool agencies may "stake claims" to educate persons for jobs we consider agricultural.

2. We are also in a position to "stake claims" for educating persons for jobs which other vocational fields and nonschool agencies have considered as their "backyard."

We need comprehensive research and development programs to determine what we can do best and what help we can obtain from others, or in other words, what they can do better than we can do. The problem of educating for gainful employment in America is so critical that society is going to demand that the specialized talents of various vocational teachers be utilized in the ways that will produce the most good for the greatest number. If we really take seriously the task of educating people for all jobs below the professional level, we will have inadequate staffs in all areas of vocational education for the foreseeable future, and longer. It also appears to me that if we accept the challenge of providing the kinds and types of instruction for gainful employment for all jobs requiring knowledge and skill in plant and animal science and related disciplines that exist or can be created, that we will have a chronic shortage of vocational educators with special competencies in agricultural subjects because of the increasing demands for their services.

Through research and development programs we need to learn where the special talents of present and future vocational agriculture teachers may best be used. There are many tasks in vocational education that teachers of agriculture because of their training are better qualified to do than any other vocational teacher. We need to identify, develop and obtain utilization of these special talents in the schools' total vocational education programs.

In planning comprehensive research and development programs, we also need to be aware of the changing attitudes of society. The pendulum is definitely swinging in America and among educators toward a more

favorable attitude regarding vocational and technical education. Whether or not we profit from this changing attitude will depend to a large extent on our research and development programs. Rationalizations for not changing vocational agriculture will only lead us down the path of disaster. In my opinion the best way to protect and extend our quality program of vocational education for farming, and I believe it is essential for society that it be protected and extended, is to become identified with that type of vocational education dedicated to the preparing and upgrading of persons to meet the changing and emerging jobs resulting from automation. Many persons, including many agricultural educators, have not recognized the new and changing nonproduction job opportunities in plant and animal science, in both rural and urban areas, that should receive our attention because no other vocational group is interested in preparing persons for these jobs, or are as well qualified as agricultural educators for providing effective and efficient programs. These emerging and changing jobs are not in farming or related to farming, but they are applied biological science jobs.

Research and Development Programs Needed

As implied in the previous remarks, we need to get into the "mainstream" of vocational and technical education. An extremely important segment of vocational and technical education in the future will continue to be the education of production workers. It is doubtful that a program in the future, however, will receive maximum public support if its total function is the education of production workers. The attention of the populace is going to be focused on changing and emerging jobs. These jobs are probably going to be in five areas:

a. Research
b. Teaching
c. Learning
d. Services
e. Recreation

It does not take much imagination to recognize that a large and important segment of the total job opportunities in these five areas will require vocational education in agricultural subjects (or applied biological science). The future for agricultural education will be challenging and exciting if we can develop research programs that will chart the course for the cultivating of the opportunities and responsibilities that are on the horizon.

1. If we are to serve society as we should and as society needs to be served, an immediate step is the changing of the image of agricultural education. We have vocational agriculture departments that have broadened their objectives and program, but the teachers, guidance personnel, parents and laymen in these communities still view their vocational agriculture program as a program designed exclusively for educating for gainful employment in farming. The program has changed but the image has remained static. The image held and propagated by certain

economists and the mass media is that we will soon have a minus number of farms and farmers and that it is a waste of taxpayers' monies to maintain vocational agriculture in the school and a waste of the talents of human beings to study vocational agriculture. To combat this image of the future in farming we need to do more than change vocational agriculture programs. We need to change the image of vocational agriculture. Research and development programs may be utilized in changing the image of vocational agriculture.

2. We need to learn how to broaden agricultural education so that it will be serving all who need, for gainful employment, knowledge and skill in plant and animal science and related disciplines.

3. We need to learn how to provide effective education in agriculture, broadly defined, for the everyday affairs of living. This is an educational service to society that will become of increasing importance as all types of work are reduced through automation. It is also important because until the image of vocational agriculture is drastically changed, it is needed as a feeder program for vocational education in agriculture.

4. We need to learn how, as mentioned previously, the specialized talents of vocational agriculture teachers may be utilized profitably and effectively in the schools' total vocational education program in teaching the content common to all types of vocational education for gainful employment. Teachers of agriculture have specialized talents that may be utilized. Dr. Agan, Kansas, has a U.S. Office of Education supported research project designed to provide some information in this area. You should observe carefully the outcomes of this project. The results may be very rewarding.

5. We also need to learn how the specialized talents of other vocational teachers, guidance counselors, nonvocational teachers, administrators and persons from industry may be utilized to decrease the heavy burden of teachers of agriculture.

6. We need to learn how to serve effectively disadvantaged youth and adults. We also need to learn how to serve effectively the upper end of the continuum, or advantaged youth and adults. Agricultural educators have an enviable record of providing effective vocational education for the disadvantaged, the poor, and the down-trodden segments of society. Agricultural educators have had more experience and more success in this field than most other vocational teachers.

We have often provided education for this group of people under protest and we have often felt that our vocational

agriculture departments were being used as "dumping grounds". Providing good vocational education for this segment of society has in certain instances made it difficult or impossible to provide effective vocational education in agriculture for the more advantaged youth and adults. We need to learn how to organize programs so that we can provide good vocational education in agriculture for all groups, and we must organize so that the disadvantaged can receive agricultural education in situations and in an atmosphere which will motivate teachers of agriculture to want to teach the disadvantaged in our society who need and can profit from agricultural education. Much research and development is needed in this area. Almost nothing has been done to date. Dr. Fuller and I have a study supported by the U. S. Office of Education that will be in operation until May 31, 1970, which we hope will provide some of the answers relating to the teaching of the disadvantaged. It is called Project R E D Y.

Organizing for Research and Development

If we are to meet the research and development needs just mentioned, plus many other needs which time limitations do not permit me to discuss, we must get better organized for research and development. Perhaps all or some of the following activities should be undertaken. (Some states have already utilized many or all of the suggestions I am about to mention.)

1. Research and development committees should be established at all universities preparing vocational teachers. These committees should have representatives from all content areas in vocational education plus access to consultants from subject matter fields. Teacher educators in agriculture can profit from participation on such committees. Such participation will broaden our educational horizons and keep us from being too provincial.

2. Earmarked time should be devoted in agricultural education staff meetings at universities to the planning and analysis of research and development projects. Earmarked time should also be devoted at supervisors' staff meetings to the planning and analysis of research and development projects.

3. Joint meetings of teacher educators and supervisors, with teacher representatives, should be regularly scheduled for the exclusive consideration of research and development in agricultural education.

4. Vocational agriculture teacher associations at both the state and national levels should be encouraged to establish research and development committees and to devote adequate time at association meetings to research and development in agricultural education.

5. The joint state staff of teacher educators and supervisors should establish special ad hoc research and development committees as needed. These special committees should report back to the joint staff.

6. Supervisors should encourage the establishment of a research and development committee with membership from all vocational education content areas. Agriculture education supervisors should be represented on this committee for the same reason given for the representation of teacher educators in agriculture on university vocational education research and development committees.

7. The supervisory staff in agricultural education should initiate the use of citizen and industry committees to advise regarding research and development programs needed. Mr. Guthrie, Chief of Agricultural Education in Illinois, has utilized the services of industry committees in (1) ornamental horticulture, (2) agricultural machinery and equipment, and (3) agricultural supply. Their use has been very worthwhile.

8. Teacher educators and supervisors should encourage action research among teachers. We have often educated and supervised teachers of agriculture with such a "tight rein" that we have virtually eliminated all their initiative and imagination. We are too prone to tell teachers what will not work instead of listening to their plans, and providing supporting encouragement to conduct action research. Only after we have done this should we even mention some of the possible "pitfalls" they may encounter. We have played "God" and have used the vocational education acts and the state plans for vocational education as clubs to stifle action research and to maintain the status quo. We have often"worshipped at the feet of tradition." The result has often been the loss of departments of vocational agriculture in many areas where agricultural education is of vital and growing importance--notably the urban areas. For example, in Illinois the Woodrow Wilson Branch of the Chicago Junior College established for 1965-66 a vocational agriculture program in the ornamental horticulture field. This development is launched after many schools surrounding Chicago dropped their vocational agriculture programs because their service area had become almost completely urban. Encouragement of action research and a more extensive research and development program, which is now possible because of the Vocational Education Act of 1963, may have saved some of these departments of vocational agriculture and their teachers could now be making their contributions in eliminating the unemployment problem in this urban area.

9. Agricultural educators should develop policies that will promote the freedom of researchers. The best way to stifle effective and productive research is to interfere with the freedom of researchers. Good research workers do not work effectively and frequently refuse to operate in an administrative "straight jacket." Some may abuse their freedom, but their number will be few. It is a small price to pay for the increased potential results.

10. Agricultural educators should encourage research by individuals. Individuals are, after all, the only ones that can do research. Do not insist that all or even most research fits into a state "mold" for research. Remember that good researchers are difficult to "harness" into a national, regional or state program of research.

11. Delegate responsibility for a research project to a definite person. I am completely disenchanted with group research projects, cooperative research projects, regional and national research projects. They lead to compromise in design and to mediocracy. We can have effective research cooperation, however, as Duane Nielsen and others promoted such cooperation in the thirty-nine states that conducted the studies of nonfarm agricultural job opportunities. There was a common objective, but each researcher was free to design his study as he wished.

12. Encourage and support both project research and program and development research. Project research is an essential ingredient of any total research and development program. Excessive reliance on project research and development, however, often stifles initiative and innovation among research workers. Program research provides a leavening ingredient for a total program of research and development. It assists in the prevention of the excessive bureaucracy and regimentation that may accompany project research and development. It provides "hard" money in contrast to the "soft" money for project research and development. "Hard" money is needed to establish and maintain an adequate staff of research and development workers.

Summary

Who initiates action? The persons in this audience, your colleagues, and officers of national and state vocational agriculture teacher associations must take major responsibility for initiating action for comprehensive state research and development programs. This is one responsibility that cannot and must not be delegated. It is too important to be neglected. The first step in initiating action is the development or revision of administrative machinery, perhaps along the lines just mentioned. Do not worry about the funding of research and development projects. If you get your administrative machinery for promoting and developing research projects developed properly, and

if you obtain well designed research proposals, funds to support your proposed research will be available. Funds from many sources are now available and more funds are on the way. Our main task is to get "geared up" for good research and development. The needs and opportunities are available. The only limitations are our enthusiasm, imagination and ability as research workers and administrators. In looking over the remaining portions of the program for this national seminar, it appears that your enthusiasm and imagination for research and development will be amply stimulated, and you should receive much help in the development of abilities for research and in the administration of research.

UTILIZING OUTSIDE RESOURCES IN RESEARCH AND DEVELOPMENT

by
Orville E. Thompson
Chairman, Department of Agricultural Education
University of California, Davis

Many questions come to mind when one begins to think about utilizing outside (and inside) resources in research and development in agricultural education. First of all, the field of agricultural education is increasing in scope. When we're considering the use of resources, are we thinking about the preparation of teachers, the supervision of the programs, classroom instruction, youth programs, or are we including the broad area of human resources in agriculture? To most people, the word resources generally means financial support. However, as one thinks more about resources, he begins to realize that money is only one resource. In one's clamor to secure money, one perhaps bypasses readily available inexpensive resources. Possibly in the final analysis many of these resources which we overlook could yield results which would dwarf that which money can buy. Obviously I mean the human resource of interested people who are available in every community. The lay resource available to agricultural education has only been partially tapped. This in itself would make an interesting theme for a conference, but since this conference is to deal more with the professional and the financial side of resources, that of the lay participation as a resource for research and development will only be mentioned in passing.

This presentation will be in four major sections. The first will be a resume of where we are in research and development. This will be followed by a review of what may be called an expanded responsibility for agricultural education. This expanded concept of agricultural education will be illustrated by a report on the changes of emphasis and philosophy in my institution. Next will be a review of what is happening in other states in terms of resource utilization. The final section will include some suggestions and precautions in the use of the new resources now available.

When looking over the program for this conference, my attention was drawn to the topic, "Are We Asking The Right Questions," which will be discussed by Mr. Kellogg tomorrow. This was particularly intriguing to me and should be to all of us in agricultural education whether our area is supervision, teacher education, administration, or research, for if we're not asking the right questions, the rest of our efforts may be in vain. This becomes particularily significant now, when we're expanding the kinds of questions and number of questions we're asking, and the kinds of people to whom we are directing questions.

It is not news to most of you that we have been asking questions about agricultural education for many years, and during the last decade some have been asking questions that others did not wish to hear, nor were the answers to these questions readily sought. I'm not certain if we asked the right questions then, or if we are asking the right questions now. I'll be interested in what Mr. Kellogg has to say on this topic tomorrow. However, I am certain of one thing. While our previous question-asking was primarily of our colleagues in vocational agriculture, we can no longer restrict ourselves to this group. Really it has been pretty cozy talking among ourselves. We have been able to protect ourselves and our professional standing, and in a way we weren't vulnerable to the outside world. We had a close-knit empire and still do to a certain extent, and I think we could defend our empire in almost any manner or form during its time. Our empire, as many other somewhat self-contained institutions, developed a familiar pattern of characteristics: its members became complacent with success, they obtained their security in the past, they became oblivious to the present, and they repulsed efforts to direct their attention to the future. This began to happen in vocational agriculture in spite of the warning from a minority both inside and outside our ranks. As a result of this and other recent incidents, we have been brought to realize that no longer can we get the complete answers to our questions, whether they are the right or whether they are the wrong questions simply from within our ranks. Those of us in agricultural education have always operated as applied social scientists as we have attempted to bring our knowledge of psychology, sociology, economics, and other basic social sciences to the problems in our field. As such, we have perhaps been guilty of having too little command of any one of the basic fields to make maximum utilization of what is known in that field on the problem we had under study. While it is hard to think of any one situation where we have made gross errors resulting from insufficient knowledge, perhaps the accumulative effect of many partially inadequate answers could have had adverse effects upon our progress. Also, we probably have limited the depth of our inquiries because we lacked the knowledge of the basic social science principles involved.

In the answering of questions in areas of education today there is an effort to bring a community of disciplines to bear upon the situation. In the past the physicist, the mathematician, the chemist, and the sociologist weren't particularly concerned with the elementary or secondary school educational process. They were ready and willing to leave this in the province of the educators. Times have change--partially through the efforts of the educator to make others concerned about problems in education, but perhaps most from the scientist's own dissatisfaction with the results the educator was achieving. And we must admit that the scientist has made a positive contribution to education. Taking a key from what has been accomplished in the other fields of education, we have increased our concern about arriving at the best possible solutions to our problems. We believe our colleagues in the social sciences

can make a contribution to the solution to problems in vocational education by bringing the resources of their basic discipline to the situation. This will then be one of the outside resources which I will discuss more fully during my presentation.

I have chosen what is happening at my institution as an example in the crossing and mixing of disciplines in the solution of problems in agricultural education. The Davis campus of the University of California is one of the three and by far the largest of the colleges of agriculture in the University system. The major in agricultural education is offered only on the Davis campus. We have a University Dean of Agriculture who is over the three colleges and a Dean of Agriculture for each campus. Our University Dean of Agriculture was appointed three years ago, while our College Dean is completing his second year in that position. While these two men are renowned biological sciencists, they have become increasingly concerned over the obvious lack of attention in California over the years to the human resource (social sciences) in agriculture and farming. Their overall interest plus a similar concern of members of our department under the leadership of our recently retired chairman, Sidney S. Sutherland, has resulted in the following action during the past two years:

1. Eleven-month appointments with Experiment Station titles have become available for our staff members.

2. Financial support for research in agricultural education has become available from the Experiment Station.

3. A statewide program for the study of farm labor has been initiated. This has included the addition of a staff member to coordinate farm foremen training classes.

4. A research program to study the backgrounds, interests, and motivational drives of the migrant farm worker has been launched. A pilot study among strawberry pickers has been completed and a study of the tomato picker is under way.

5. A committee to study the need for research on the socio-economic aspects of agricultural labor has been appointed by the University Dean of Agriculture. This committee includes an agricultural economist, a sociologist, the Director of the Agricultural Extension Service, and the chairman of the Department of Agricultural Education. This committee also serves as an advisory group for farm studies.

6. A staff member has been added to our department to give leadership in adult education. Initially this will include a teacher education program for instructors of adult illiterates and research on the barriers adults encounter in learning. From this we hope to find ways to improve our approach to adult education in vocational agriculture and agricultural extension.

7. A full professor position has been given to our department to expand our program of teaching and research in the social sciences related to agriculture. (We are currently recruiting for this position.) This person is to study the need for research on the human resources in agriculture.

8. A College of Agriculture committee has been named to make recommendations for the development of social science research (other than economics) in the Agriculture Experiment Station. Membership on this committee includes a sociologist, a political scientist, an agricultural economist, a home economist, a geneticist, and an agricultural educationist. This committee has recommended that the agricultural education department provide aggressive leadership in research in the human resource need in agriculture.

9. The 1966-67 budget to the legislature includes a request for four new academic staff positions for the Department of Agricultural Education. These persons are charged with the study of the problems of the migrant and unskilled laborer in the rural and outdoor environment. It is specified that these staff positions include a sociologist, a psychologist, an educator, and a specialist in research and analysis.

10. A reorganization within the Department of Home Economics has resulted in the addition of two staff members in child development and a nursery school to the Department of Agricultural Education. This was an effort to place all the social sciences (except agricultural economics) in the College of Agriculture into one department. The administration believes that we should approach the problems of human resources in agriculture from all levels of education--i.e. from the nursery age child through the adult.

You might wonder what this kind of a program has to do with the traditional function associated with departments of agricultural education--that of preparation of teachers of vocational agriculture in high school, the supervision of these programs, the development of teaching materials, the work with Future Farmers of America, and the host of other activities involved. Yes, we will continue these, but we feel that agricultural education has a charge beyond that of its traditional function. In addition to preparing young men for careers in agriculture we need to study the whole human resource in agriculture. Previously, research efforts in California at least have concentrated on the agricultural technology, the economics of production, marketing, and processing agricultural products. Again in California--which has up to a half-million in the farm labor force--practically no effort has been made to study this important input. We have always subscribed to the objectives in vocational agriculture to prepare young men for farming and agricultural occupations

through the application of the principles of science and economics, yet we have bypassed study of perhaps the most important ingredient in agricultural production--and that is the human who does the work--makes the decisions and reaps the profits or the losses from his efforts. We have been given the responsibility for this effort at our institution and the resources to proceed. It is a challenging task indeed.

Needless to say, the assuming of additional responsibilities by a department creates a host of problems, not the least of which is that we must not go outside the resources of our department and college both for financial support and for professional assistance. As you already know, it's usually much easier for us to communicate with our colleagues in education and agriculture than it is with our professional colleagues in the basic social sciences. While we feel we need the assistance of professionals in the basic social sciences, not all of these people share our concern for the study of problems in education. It's not unusual to find these people are already overburdened with their individual research interests, and some question the value of the contribution their discipline can make to the solutions to problems in education. For example, it has taken a number of meetings of our college committee on social sciences in agriculture just to be able to communicate with each other. It becomes immediately obvious in these kinds of situations that those of us in education, in agricultural education, and in agriculture have not achieved general understanding of our problems with our colleagues on "the other side of the campus" or "in other agencies." We have kept to ourselves too long. However, there are times when one wonders if it wouldn't be better or at least much easier to continue to keep to ourselves. I know it would be less frustrating.

Thus, one of the outside resources we're using for research and development in agriculture education is professionals in the social sciences. To date we haven't used these persons directly on problems in vocational agriculture. However, we expect to in the future, for we now have our Deans of Agriculture, the Director of Agricultural Extension Service, The Dean of University Extension, state personnel in adult education, agricultural economists, and others involved in one way or another with our program in agricultural education. The mere fact that we have reason to interact with these people has paved the way for future opportunities to obtain assistance from these individuals in problems in vocational agriculture. One concrete example of benefit came recently when the chairman of the Department of Sociology asked if he could contract for one of the staff members in Agricultural Education to teach an upper division course in his department next spring semester. We have recently affected a joint appointment for a staff member with University Extension to work in the field of adult education. This is the first of its kind on our campus--already there is talk of another. Then it is obvious that the success of our expanded program is dependent upon how well we can utilize outside resources in research and development in agricultural education.

Another outside-inside resource we've used is the procurement of financial support for research. While our operation is in its infancy, this year we'll have funds from sources such as the Experiment Station, Campus Research Committee, Chancellor's Office, University Extension, Economic Opportunity Act, Public Law 88-452 Title II-B, Vocational Education Act of 1963, and from the Cooperative Research Branch of the U.S. Office of Education.

In order to find the extent of use of outside resources in agricultural education by other states a survey was made of a sample of states, and as you might expect, states are using many sources for the procurement of support. The following are but a few examples of how states are capitalizing on resources. Colorado has 4-(c) funds for an occupational study in which they are using the resources of the University research foundation, their guidance and testing service, and their data processing center. This fall Colorado will have a graduate assistantship supported by their State Board for Vocational Education. New York obtains financial support for research from an Agricultural Businesses and Industries Group, from the Council of Agricultural Cooperatives, and from a Ford Foundation grant in teacher education. In Illinois support is obtained from the Production Credit Association and from the Illinois Agricultural Association Youth Committee. Minnesota utilizes the Upper Midwest Research Center, the Veterans Administration, in addition to the State Labor office. In New Mexico one rather small Chamber of Commerce is contributing $2000 for an area occupational study. Pennsylvania obtains outside resources from the Federal Land Bank of Baltimore, Pennsylvania Rural Electric Association, Game Commission of Pennsylvania, Employment Security Agency, and the National Defense Education Act. Maryland obtains funds from the McIntyre-Stennis Act for study of forest recreation opportunities. Missouri has four NDEA fellowships in vocational education. In Iowa assistance is obtained from the Iowa Farm Equipment Club, from the Western Feed and Grain Dealers Association, and from the Iowa Grain Dealers Association. Many others could be mentioned. However, I think this listing gives some idea of the variety of sources now used by agricultural educators. Reference to usual sources such as the state departments of education and experiment stations was purposely omitted. If we were to add those concerns and agencies who support development of agricultural education through the Future Farmer organization, the list would be still more extensive.

However, few of the some twenty states surveyed reported use of resources other than those which provided money or a service such as data processing. Either use of professionals in the social sciences wasn't a common practice or the questions asked weren't clear. I suspect that involvement of persons in other disciplines in our programs of supervision, teacher education, and research in agricultural education is being approached with caution--as perhaps it should be. Several states mentioned that the availability of competent professionals in agricultural education was a limiting factor in their program in research and development.

In reviewing the reports from the various states, the impact of the Vocational Education Act of 1963 was obvious. Most states mentioned they either had resources from this act or they planned to apply for funds from this source. Another example of increased research productivity in agricultural education is the number of reports of studies we have received during the past year.

It now appears to me that we have overcome, or are in the process of overcoming, the three major barriers we've faced in obtaining resources for research and development in agricultural education.

The first of these barriers is fear. For years the leadership in agricultural education consciously and subconsciously was held back by restrictions they felt were placed upon them by the legislative acts from which they received funds. Too few states were brazen enough to forge ahead in the face of criticism. I'm confident that the obsolescence of which we are accused--and too often were guilty--can be attributed to this fear under which we operated. We are conservatively ten years behind in updating our thinking and programs in agricultural education. Now when we need and have the resources to forge ahead we don't have the research to give us guidance. Current legislation should eliminate the basis for any fear of nonconformity to Federal regulations.

The second of these barriers I will call excessive exclusiveness. We were a fraternity and still are, but now at least some restrictions upon membership have been lessened. We're now offering associate membership to some of our colleagues in the social sciences related to our field. Previously, we have been more closely identified with agriculture professionally than we have to the other half of our area--that of education. We should not lessen our intimate contacts with the technical field of agriculture while increasing our bonds with social sciences. Overcoming this barrier has been in two parts: the first and maybe the most difficult was to accept the fact that we didn't have all the answers to our problems and that others in social science may be able to help. Once this was accepted, and this had taken several years, we needed to take the next step--that of taking the initiative in approaching these persons for help. Indications are that we are making progress in this direction.

The third of these barriers which is being overcome is the obtaining of partial, if not adequate, financial assistance. Evidence from the various states suggests that progress is being made in obtaining money from various sources to further the efforts in research and development in agricultural education. Extensive use is already being made of Vocational Education funds--obviously additional funds will be available from the Economic Opportunity Act and others. As has been mentioned previously, obtaining interested and qualified researchers in this field is a problem yet to be overcome and one which this center is and should take the leadership.

Now, what are my personal reactions to this over-all development and the limitations which I see in the direction which agricultural education is taking as it seeks its place in research?

During the past decade the availability of outside resources for research has had terrifying influence upon research in colleges and universities. This money came first to the physical sciences, then to the biological, and now to the social sciences. On the positive side it has enabled the researcher to expand the frontiers of knowledge in the various sciences far beyond what would have otherwise been possible, and, therefore, to the over-all benefit of society is positive. On the other hand let's look at the freedom of the individual researcher and the institution of the University as a free agent in research. Is the individual really doing the research he truly wants to do or is he doing what he knows will be acceptable to the review committee who decides the destiny of his research proposal and maybe his own position? The size of the National Science or the National Health grant or contract the individual controls has become a prestige factor on many campuses. The poor researcher without a grant has to borrow equipment from his grant-rich coworker and stay at home while his coworker jets off to meetings across the U.S. and the world at grant expense to report his findings. I truly hope that those administering the funds from the Vocational Education Act will be able to improve upon the systems to which other federal agencies have become victims. Certainly, there must be another way of allocating funds than by a competitive project basis. I hope it can be found. It might be profitable to look for guidance to the system the U.S.D.A. uses to allocate funds to regional experiment station projects.

Two limitations are implied in the above statement: one is the restriction put upon what the researcher or institution wants to do by the granting agency. Certainly it is recognized that neither public now private granting agencies can allocate funds indiscriminately. They have a responsibility to the public or their boards of directors to insure that the money is used intelligently. Yet, the researcher and the institution needs more freedom than is available in many situations today. Some grantors require detailed quarterly reports and annual renewals which take an unjustifiable amount of the researcher's time from his work. The pump-priming policies of some foundations and agencies, while worthy in intent, may leave institutions unable to continue certain beneficial research centers and like activities once the grantor has fulfilled its original commitment. There have been instances where an institution found it easier to promise to obtain funds to continue an activity than it was to convince legislators and others of the necessity for funds. The insecurity in "soft money" operations has adversely affected the ability to recruit and hold a qualified staff.

A second limitation is the paper work--the delay, the inconvenience, and the frustration involved in obtaining money by the project method. In our state the last review panel had over a thousand proposals to

evaluate. The sheer mechanics of handling the proposals has become overwhelming. Many hundreds of man-days were used by professional educators just to review the proposals--and this happens twice a year. In a sense, every vocational program is operating on "soft money." This seems to be inherent in the usage of private as well as public funds.

In moving ahead in obtaining resources for research and development let's keep asking ourselves questions such as the following:

1. Are we maintaining a balance in our program of supervision, teacher education, and research? Are we sacrificing the quality of our teacher education and supervision program to take on added responsibilities in research? What activities are we going to de-emphasize when we add new functions and assume added responsibilities.

2. Where can we obtain new staff and other personnel to conduct research? How can we upgrade the research competency of our present personnel?

3. How can we identify and recruit social scientists who are experts in their fields and also interested in research in agricultural education?

4. How can we get a steady flow of "hard money" for research and development? (How can we obtain "soft money" for projects?)

5. How can we keep the added activities of research and development from adversely affecting the quality of our classroom teaching?

6. Are we researching the most important problems in agricultural education or are we pursuing our individual interests without due regard to the overall needs of vocational agriculture? Are we working toward some basic as well as applied research activities? Can we accomplish both?

7. Are we assuming more responsibilities than it is possible for us to supervise?

These are the kinds of questions we must face as we move ahead in research and development.

By now you perhaps feel that I can see no good in using outside resources for research and development. Quite to the contrary. I realize that we are victims of a system with which we must learn how to work, as change is beyond our power. Outside monies are a real ray of hope in education, as obtaining additional funds from our individual state legislatures appears hopeless. Utilizing outside professionals offers another ray of hope for progress and maturity in agricultural

education. However, in our contacts with our colleagues in the basic social sciences let's not give the mistaken impression that we are desperate for help. Let's let them know we have a good program in agricultural education but we think they can help us make it better. Let them know that the public acceptance and public recognition of the value of vocational education has never been better. Let them know that we are asking them to join a winning team and a team that is on the move. So let's see how we can make the fullest use of the financial resources from the Vocational Education Act and other sources to solve problems in agricultural education, and in the planning and in the process, let's consult with and involve our colleagues from the related social sciences in our research activities. Let's see if we can get some regional research activities underway so we can revive what we lost with the elimination of our old regional system. The challenge is here--the resources are available. How we utilize these in the further development of agricultural education is our challenge. First, however, we must find if we are asking the right questions.

OPPORTUNITIES AND RESPONSIBILITIES FOR RESEARCH AND DEVELOPMENT

by
Duane M. Nielsen
Director of Educational Resources Development Branch
U. S. Office of Education

Gentlemen, it is a distinct pleasure to be a participant in this seminar. I appreciate the opportunity to associate with you again for I have grown to respect you highly through the years. May I take this opportunity to commend each of you for the dedication you have exhibited and contributions you have made to the development of agricultural education programs. It is also pleasant to participate in an activity that is this well planned and administered, particularly when we recognize the significance of this seminar, and comparable activities, to the future of vocational and technical education. The adjustments and expansion in agricultural education necessitated by a dynamically changing agricultural economy will occur, to a great extent, through the efforts of individuals like you who are responsible for the research and development activities which give direction to operating programs.

Several of you were present five years ago at the Regional Agricultural Education Conference in Chicago when I made an illustrated presentation on the needs for vocational education in agriculture and challenges confronting the program. Most of the rest of you here today heard the presentation at subsequent Regional, State or National Conferences. I indicated at that time we were crossing the threshold of what would become the most dynamic decade in the history of agricultural education. It would be dynamic in the extent to which we successfully met the needs for program development or equally dynamic in our failure to do so. One of the priorities identified was the generation of a research and development capability equal to the task.

You may remember the transparency illustrating the little chameleon and its ability to adapt its color to match its environment. It got along fine in life until some enterprising soul put it on a piece of scotch plaid, and it died of frustration. We're not out of that scotch plaid situation. Our kilt may be a little shorter, a little longer, or the plaid may be a bit different in terms of its components, but we are still in a multiplicity of complexities and will be for years ahead. Adequate research and development is a virtual necessity to programming under these conditions.

We are not members of a static society or industry; we are participants in rapid change. Thus, the supreme challenge to research and development in agricultural education is to innovate, experiment, and demonstrate so that programs may more effectively serve a broadened clientele. This task will not permit us to sit on our hands, it will not permit us to stagnate, it will not permit us to build on dead yesterdays - we must concentrate on unborn tomorrows.

This does not mean that we wipe the slate clean, assuming that all we have done has gone by the board with no value. During this conference, as we plan more effective ways of stimulating, conducting, disseminating, and implementing research and developmental activities, we must remember and respect those numerous program strengths that have developed through the years. We should build on those procedures and materials which we have found to be effective; expand them and strengthen them while exhibiting the clarity of vision that will permit us to adapt, to adjust, and to be realistically creative. This is our charter for the future and one of the commitments to take home from this conference. You who are here today have the authority and the opportunity in your positions to respond to this challenge.

With that introduction, may we now focus on the three areas I would like to discuss with you. First, it has been suggested that I review the July 1 reorganization of the Office of Education. Although indirectly related to our topic, discussion of the reorganization does have relevancy to opportunities for research and development in that it will expose the new Office of Education administrative structure for such activities. Second, I would like to give you a progress report on the fiscal 1965 activities of our program operated under Section 4(c) of P.L. 88-210, the Vocational Education Act of 1963. Third, I will suggest some priority areas for research and development concentration in agricultural education.

Reorganization

When the Department of Education was created by Congress in 1867, the new government unit was authorized to have a Commissioner of Education and three clerks. Total budget: $9,400 a year. Ninety-three years later -- in 1960 -- the Office of Education had 1,100 employees and was running 20 separate education programs with annual expenditures of $500,000,000. Today, the Office of Education is handling more than 40 education programs with more than $3,300,000,000 authorized. It has 1,600 employees.

The statistics demonstrate the obvious. Education has finally come into its own. It is not growing -- it is exploding. Congress has given the U. S. Office of Education major responsibilities for carrying out programs to improve American education.

Early in 1965, the President of the United States -- at the request of HEW Secretary Celebrezze -- appointed a special Task Force "to advise and assist the Office of Education to meet its new program responsibilities." The Task Force, headed by Dwight Ink of the Atomic Energy Commission, included members of both the Bureau of the Budget and the Civil Service Commission.

For three months, the Ink group probed, questioned, investigated, and evaluated. On June 14, 1965, the Task Force completed its work. Four days later, Secretary Celebrezze submitted the Task Force's recommendations to the President and the Cabinet.

The Task Force's recommendations became public as a neat, pencilled chart of organization boxes. Transparency 1 shows the Office of Education administrative structure prior to the reorganization, and Transparency 2 illustrates the new structure recommended by the Task Force, as it became effective July 1.

The Task Force concluded that the Office of Education had become "fragmented and unduly layered" by a patchwork of organizational units created for each new education law -- sometimes for each new title of a law. A reorganization was necessary. But the neat little boxes were only part of the story.

The Ink group singled out a most important element in revamping the Office of Education -- new blood. First priority, said the Task Force, is to recruit new personnel. It urged that competent personnel from disciplines other than professional education be carefully considered for service in the Office of Education. It called for an ad hoc committee under the Deputy Commissioner to identify vacancies, review applications, and set up recruiting teams. It asked for hard-hitting recruiting efforts at both professional and clerical levels.

As the Ink proposals were carried into effect, the Office of Education prepared for orderly chaos. Eight hundred new personnel had to be hired -- including many top-level super-graders. Personnel from defunct bureaus had to be reassigned. Additional office space had to be found in buildings outside 400 Maryland Avenue. The Bureau of Higher Education, for example, went from 187 to 336 positions. Entire bureaus were moved physically to new locations. Other bureaus merely evaporated. Transparency 3 provides additional detail on the reorganization in that it indicates administrative personnel assignments and locations as of July 30.

The major reorganization and adjustment involving the vocational and technical education research and development program, and the administration of Section 4(c) of P.L. 88-210, is that we were formerly the Occupational Research and Planning Program (ORP) in the Division of Vocational and Technical Education (DVTE). We are now the Division of Adult and Vocational Research (DAVR) in the new Bureau of Research (BR). The DVTE-ORP structure prior to reorganization is shown in Transparency 4 and the DVTE structure after reorganization in Transparency 5. The present BR-DAVR organizational pattern was indicated in Transparency 3 and additional DAVR organizational and staffing detail is given in Transparency 6.

Specific procedures have been implemented to assure close coordination and communication between DAVR and DVTE. This is essential if research and development and program operation are to render effective service. Joint staff meetings, committees, project and program review are parts of this effort. There are definite advantages to DAVR and the other OE research programs being centralized in the new Bureau of Research. Uniform procedures and a coordinated concentration on research and development priorities in education should result in increased program efficiency. One combined policies and procedures document for the Bureau of Research is being prepared. Until

it is distributed, initiators of vocational education proposals should continue to follow OE-4262, "Conditions and Procedures: Grants for Research, Training, Experimental, Developmental, or Pilot Programs in Vocational and Technical Education." All proposals should be sent to the Bureau of Research, U. S. Office of Education, where they will be assigned to the appropriate Division for processing.

TRANSPARENCY 6. DAVR Organizational Structure Effective July 1, 1965

FY 1965

On June 30, 1965, the Occupational Research and Planning Program (DAVR since July 1) completed its first year of activity. Although the program had been in operation slightly less than nine months the response was impressive. In summary:

- 475 proposals were received, almost double our January 1965 estimate. Assuming that each proposal represents five man days of effort by those in the research community on vocational problems, the program generated 2,400 man days of effort at no expense to the Government.

- 146 proposals or 31 percent of the total received were approved by the Commissioner and all will become firm contracts within the next few weeks.

- The total appropriation of $11.85 million for fiscal year 1965 was expended.

The distributions of projects approved during fiscal 1965 are shown in the next four transparencies. A brief examination of these distributions provides an overview of the scope and diversity of program activity. Transparency 7 indicates the distribution of approved projects by areas of major impact.

TRANSPARENCY 7. DISTRIBUTION OF APPROVED VOCATIONAL RESEARCH AND DEVELOPMENT PROJECTS BY AREAS OF MAJOR IMPORT, FY 1965 (N-146)

Job Analysis	6	4%
Testing and Evaluation	6	4%
Curriculum	13	9%
School Organization, Administration, and Special Programs	7	5%
Methods, Material, Media	7	5%
Teacher Education and Training	22	16%
Individual and Social Characteristics	14	10%
Career Choice	5	3%
Guidance and Counseling	8	5%
Special Groups (Drop-outs, Adults, Disadvantaged, and Slow Learners)	19	13%
Research and Development Planning and Administration	39	26%

Classification of the projects into areas of major impact yielded a 16 percent distribution of approved projects for teacher education and training, 13 percent for immediate vocational needs of dropouts, adults, disadvantaged and slow learners; 26 percent for the training and support of research personnel, and the rest scattered among the other eight classifications. The latter area includes two vocational research centers, 23 State Vocational Research Coordinating Units, and several small projects aimed at improving research management. A high multiplier effect from these projects is expected and reflects a sound first-year investment in program growth potential. There is a reasonably good distribution of projects covering topics stressed during FY '65, e.g. identification of emerging job opportunities, optimum location of vocational schools, evaluation of teacher certification requirements, in-service training for vocational teachers, and the improvement and expansion of State vocational education planning organizational and administrative capabilities. We are also supporting or participating in a number of projects concerned with exploiting new information handling techniques through computer-assisted instruction, and electronic data processing of information on the statistics of the vocational system and on research activities completed or in process. Application of systems analysis and operation research techniques to major vocational problems is also being attempted.

The distributions of Branch program area, submitting institutions and type of project are given in Transparency 8.

TRANSPARENCY 8. DISTRIBUTION OF APPROVED VOCATIONAL RESEARCH AND DEVELOPMENT PROJECTS BY BRANCH PROGRAM AREAS, INSTITUTIONS AND TYPES, FY 1965.

PROGRAM AREAS (N=146)			INSTITUTIONS (N=146)				TYPES (N=146)				
EO	HRD	ERD	Colleges & Universities	State Education Departments	Local Education Agencies	Private Organizations	Res.	E-D-P	Tng.	C	RCU
13	36	97	105	24	7	10	46	42	33	2	23
9%	24%	67%	72%	16%	5%	7%	32%	29%	22%	1%	16%

PROGRAMS

EO - Employment Opportunities
HRD - Human Resources Development
ERD - Educational Resources Development

TYPES

Res. Research
E-D-P Experimental, Developmental, and Pilot
Tng. Training
C Centers
RCU Research Coordinating Units

The distribution by Branch program areas shows 67 percent of the projects falling under Educational Resources and Development, 24 percent under Human Resources Development, and 9 percent under Employment Opportunities. The high percentage in Educational Resources is consistent with the relatively heavy emphasis noted above on training programs and on demonstration projects.

The problem of attracting competent behavioral scientists to work on vocational aspects of human resources development, and competent economists to undertake occupational research projects has delayed the response in these two program areas. The situation is improving, but for the next few years we will be in competition with other research and development programs for behavioral and social science research talent.

A substantial number of approved projects - 72 percent - went to colleges and universities. These statistics can be misleading, however, because many university projects were undertaken on behalf of State and local school systems.

A better balance was achieved in the distribution of types of projects. Thirty-two percent was for research; 29 percent for experimental, developmental and pilot programs; 22 percent for training; and 17 percent for research centers and State Coordinating Units. The relatively large proportion of experimental and training projects should yield early and visible results and thereby make immediate contributions to an improved vocational system.

The geographical distribution shown in Transparency 9 reflects a concentration of projects in California, Illinois, Michigan, New York, and Pennsylvania, with 57 percent of the total number in these five States. Only 13 States show no approved projects.

Transparency 10 lists the projects approved during FY 1965 which have relevancy to agricultural education. Those received and awaiting review action are listed in Transparency 11. Although several of these projects have more than one investigator, only the name of the principal initiator is listed. In addition, portions of the programs at the two approved centers, Ohio State University and North Carolina State University, will relate to agricultural education. Also, the five major research and development units and 23 research coordinating units will conduct activities relevant to agricultural education.

Overall, the statistics indicate program activity at a much higher level than we expected. Where imbalances existed, adjustments have been sought through active solicitation and sponsorship of needed studies. We expect to do more of this as our professional staff expands.

Behind the proposal and project statistics lie a number of accomplishments and problems which provide a different perspective of the program.

The Conditions and Procedures and the Federal Regulations governing the submission and handling of proposals and the administration of contracts were first issued in November 1964. Over 15,000 copies have been distributed throughout the educational and research communities. In March, supplementary Conditions and Procedures were issued for submitting proposals on vocational research centers, and in April for proposals on State research coordinating units.

A Preliminary Statement of Guidelines for the Occupational Research and Planning Program was issued simultaneously with the Conditions and Procedures. This statement of program objectives and research priorities reinforced the more legalistic program documents and enabled us to announce our presence and state our program interests to the public. More than 15,000 copies have been distributed.

Two interim research review panels of outside consultants were established, one dealing with proposals in both the Employment Opportunities and Human Resources areas, and the other with Educational Resources proposals. Arrangements are now underway to expand to three permanent panels as authorized by the Secretary of Health, Education, and Welfare. These panels are essential components of the Office of Education's research proposal review machinery and have been helpful in shaping the total program. Their members contribute their professional advice not only on individual proposals but also on program plans and procedures. They have been most helpful and unsparing in offering their time and effort. An additional benefit from their participation has been wider program visibility among professional educators and research scientists. Full panel meetings were held in November, January, and March. Special ad hoc panel meetings were convened in May to review Research and Development Center and State Research Coordinating Unit proposals. In all, 230 proposals were reviewed by these outside panelists between November and May.

In March, the Commissioner approved a special staff review system for training and conference proposals under $50,000, and for research, experimental, developmental and pilot (small grants) proposals under $7,500. Seventeen staff review panels were convened between March 15 and June 30 to review 115 proposals.

A favorable legal opinion was obtained on the payment of subsistence allowances, travel, per diem, and tuition and related fees for professional persons participating in training programs. This kind of support is critical to the success of teacher and researcher training programs. The favorable ruling permitted funding action on more than 30 summer conference and institute proposals and should stimulate a large number of similar proposals in the future. We estimate that about 1,000 teachers will be trained through these 1965 summer projects.

An interdisciplinary staff has been recruited. Of the professional research positions available, 22 had been filled by June 30. The remaining seven vacancies should be filled by August 31. The professional distribution of the staff includes social and behavioral scientists, economists, general educators, and vocational educators.

Among its varied activities, the staff had major roles in developing and planning a summer inservice training program at the University of Maryland for Division and State professional personnel. This program, stressing both vocational education and social science topics, has proved helpful in orienting new personnel.

The large number of staff vacancies during the early months was, and remains, a severe handicap. At times, it has been difficult to balance the large influx of proposals and requests for assistance resulting from these contacts against the production demands of the proposal review and processing system. Fortunately, we had considerable assistance from other OE offices, and the large measure of procedural latitude usually granted new programs permitted us to take some helpful shortcuts. With a full staff complement in fiscal year 1966 we hope to speed up our review and processing procedures.

Research program planning and development received high priority during this first year of activity. The major conferences and seminars sponsored were:

1. A November conference of leading vocational researchers;

2. A March conference of trade association executives;

3. A May conference at MIT of key representatives of the education, research, business, and governmental communities, to plan a major study of possible innovations in vocational curriculum;

4. A June conference at the University of Wisconsin, of leading economists to gauge the economic data needs of the vocational program;

5. A summer conference at Michigan State University for AFL-CIO union representatives from each of the 52 States; and

6. Four seminars for vocational and technical education researchers.

Every available opportunity has been followed up to initiate meetings with other Federal agencies, professional societies, foundations, and business organizations having an actual or potential role in vocational research. At the annual conventions of the American Vocational Association, the American Educational Research Association, and the American Psychological Association, the new program was presented to large and receptive audiences. Presentations were also made at nine regional conferences, conducted in January and February by the Division of Vocational and Technical Education for State Directors of Vocational Education and their staffs.

Modest efforts were made in the dissemination of research results. Lines of communication have been established with State Directors of Vocational Education and State Department of Education Research staffs through the distribution of periodical listings and abstracts of proposals received and funded. Arrangements have also been made to furnish information regularly to research journals and newsletters. Directors of Centers and State Research Coordinating Units will become an integral part of this dissemination and communication function.

Hopefully, the recent reorganization of the Office of Education should help us to improve this vital function. Within the new Bureau of Research will be a Division of Research Dissemination and Training. It will, among other things, make available an Electronic Data Processing System for the storage, retrieval, and dissemination of research information.

Closely related to stimulation and dissemination efforts is the provision of consultative services to prospective sponsors of proposals. These services range from expressing an opinion on the relative merits of a budding concept to lengthy and involved meetings and exchanges of correspondence on the actual development and drafting of a formal proposal. These services provide a rich area for both teaching and receiving instruction on research and development design and methods; they probably provide the most severe tests of the professional skills and attitudes of the program research staff. We have not been able, of course, to accommodate all requests. In recognition of this problem, we have indirectly expanded our consultative capabilities by funding the two vocational research centers and 23 State Research Coordinating Units. In addition, the series of intensive seminars was conducted at four major universities for vocational researchers on research objectives and proposal preparation procedures and methods. We intend to expand support for this type of activity.

The earlier mentioned preponderance of university sponsors of projects in fiscal year 1965 emphasizes the need to improve the research capabilities of State and local educational agencies. Most of the efforts discussed above point in this direction. The lack of response on the part of State and local school districts is often not so much a shortage of available research talent as a need for training professionally qualified persons in the mechanics of preparing proposals. The creation of the new Bureau of Research gives the Office of Education an excellent opportunity to revamp and simplify its research application and funding procedures, and the Division of Adult and Vocational Research expects to play a strong role in this process.

Considerable effort has been made to develop and maintain close relationships with other Government agencies. An immediate concern is with working out effective operating relationships between the Division of Vocational and Technical Education and the Division of Adult and Vocational Research, and with the four other Divisions in the new Bureau of Research: Division of Research Training and Dissemination; Division of Elementary and Secondary Research; Division of Higher Education Research; and Division of Laboratories and Research Development.

We have, of course, considerable experience in working with the Division of Vocational and Technical Education, and the legislative mandate in the 1963 Act enables us to concentrate on providing research and development support to its programs. The disadvantages of organizational separation between the research and operating programs should be offset by the ability of the Division of Adult and Vocational Research to focus all applicable program resources of the Bureau of Research on the needs of the vocational system. For example, the Division of Research Training and Dissemination and the Division of Laboratories and Research Development offer new and promising support potential.

We are also engaged in efforts to define the vocational implications of the research provisions of the 1965 Elementary and Secondary Education Act, and have been active in developing methods of funding comprehensive projects from the resources of several other statutory programs.

In improving our coordination with other Federal agencies, we have concentrated principally with the Office of Manpower, Automation and Training of the Labor Department, and the Office of Economic Opportunity. With OMAT we have developed a good division of labor on complementary research and development areas of emphasis. Although the programs of the Office of Economic Opportunity are still being defined, we have had some success in working out joint support arrangements for vocationally oriented projects involving both that agency and the Office of Education. During the next fiscal year we plan to strengthen program contacts with the Departments of Agriculture and Commerce, and with agencies such as Defense and NASA which also make major investments in manpower research and training.

Seven areas of special emphasis have been selected by DAVR for priority attention during the coming year. Listed in the order of their priority, they are:

1. Program Evaluation
2. Curriculum Development and Experimentation
3. Personal and Social Significance of Work
4. Personnel Recruitment and Development
5. Program Organization and Administration
6. Adult and Continuing Education
7. Occupational Information and Career Choice

I will discuss these priority areas in terms of their application to vocational and technical education in general, however, the implications for agricultural education are obvious.

1. Program Evaluation

The Vocational Education Act of 1963 requires that a report evaluating Federally supported programs in vocational education be presented to the President and the Congress not later than January 1, 1968. Research projects designed to contribute to this evaluation have a high priority since they must necessarily be completed well in advance of the January 1, 1968, date. Research will be directed to the following specific problem areas:

(1) Determining the effectiveness of new vocational education programs supported by Federal funds under the 1965 Act with reference to career patterns, employment records, and incomes of graduates and non-graduates; the amounts and kinds of vocational and on-the-job training considered necessary by employers; high school dropout rates; and other measurable factors relating to the success or lack of success of participants in such programs. Particular attention will be focused on the intergovernmental fiscal relations aspect of vocational education; e.g., the extent to which matching funds for new programs represent new resources devoted to vocational education.

(2) Comparative studies of alternative methods of preparing individuals for work and economic evaluation of training programs in particular occupational fields. Studies which seek to determine the relative effectiveness and relative costs of the many ways young people are prepared for work and the ways in which experienced workers acquire additional training will be actively pursued.

(3) The impact of vocational education on job changes (among areas, occupations, and industries) and other aspects of economic resources mobility will be carefully considered.

2. Curriculum Development and Experimentation

The basic objective of this area of concentration has been to stimulate a critical examination of present educational practices in vocational and adult education, particularly those that relate to the teaching of disadvantaged youth and to encourage and support research and development projects in curriculum and teaching of new and emerging occupational skills. Among the highest priority items in vocational education is the need to identify the knowledge and skills required to qualify for a cluster of rapidly developing occupational opportunities. The establishment of new configurations of vocational programs which will concentrate on groupings of related occupations, such as the health services or agriculture services occupations, will be explored.

The best developed instructional resources, media, and facilities will be applied in the development of these new skills. Recent innovations in simulation training and computer based instruction, particularly those pioneered by NASA and the Armed Forces, will be explored for their relevance to vocational education. Experiences gained at the Job Corps Centers and MDTA programs will be evaluated and emulated where applicable.

The Division will be interested in curriculum proposals which examine, experiment with, and offer well articulated programs at various grade levels below that of professional, including the specification of teaching methods, and materials in the following occupational fields:

(1) Health services occupations
(2) Engineering-technician occupations
(3) Recreational occupations
(4) Ornamental horticulture and agricultural services occupations
(5) Building maintenance
(6) Public service occupations
(7) Social welfare occupations
(8) Office occupations

In addition, studies which evaluate these and other curriculum offerings and curriculum materials are desired. The principal purpose will be to identify the relative effectiveness of different methods of teaching and the best combination of practices and materials in preparing people for newly emerging job opportunities.

Research and experimentation will also be focused on new administrative structures and organizational patterns for establishing and carrying out new occupational training and adult education programs. This should include consideration of new and improved methods of teacher utilization and the application of educational technology to the needs of adult and vocational education.

3. Personal and Social Significance of Work

The concept of work as a major factor in adult life is central in our society. From his work the individual derives not only his income but also many of his personal satisfactions and his status in the social groups with which he has contact. In order to prepare him for his role as an employed adult and to help him continue to grow both as an individual and as a member of society, it is necessary for us to increase our understanding of how a person forms his concepts of work. We need to know more about the kinds of things which motivate him in various work-related situations and the ways in which he derives his satisfaction from them. Knowledge about a person's aspirations and their relationship to his abilities are vital in providing counseling and guidance. The place of

different kinds of work in the individual's value structure and also in the value structure of various social groups is of major importance in his choice of an occupation. The interaction of his work and his self-concept throughout the various life-stages of adolescence through maturity must be considered in preparing the person for work entry as well as continuing education and training.

Understanding the worker as an individual and as a member of society is crucial in planning his education and evaluating his performance. Research in terms of the non-college bound will be encouraged in all of the areas mentioned above, and development projects which utilize such knowledge for purposes of counseling or designing better educational programs will be considered.

4. Personnel Recruitment and Development

Accelerated technological change, space research and development, a rapid expansion of the service industries, and an expanded vocational education program at the secondary and post-secondary levels has increased the demand for vocational teachers. New area vocational schools are being built. Many high schools and community colleges are adding vocational courses. To keep pace, it is imperative that high priority be accorded to the recruitment and development of competent vocational and adult education personnel; thus the goal of this fourth area is to assist in the development of an adequate supply of the types of personnel needed to staff new programs of vocational and adult education and to develop procedures to permit the upgrading of present personnel.

Studies are needed which relate to the determination of the numbers, qualifications, and sources of people needed to meet the staffing requirements of current and projected adult and vocational programs.

Research is needed to determine what vocational teachers should be taught and how teacher preparation programs should be organized at our Nation's colleges and universities.

The development of experimental programs for training new and current personnel are required. This should include the training not only of vocational teachers and counselors but also of school administrators and related vocational-technical-adult educational personnel. Funds are available to conduct summer and other institutes for teachers for new and emerging occupations or to upgrade the competencies of teachers presently engaged in adult and vocational programs.

5. Program Organization and Administration

A number of investigations should be directed to the improvement of existing organizational structures of vocational education at State and local levels. The identification of factors which influence change, such as attitudes of State boards for vocational education; use of advisory groups; involvement of appropriate groups in the formulation of State plans, of matching funds, and other patterns of organization which facilitate rapid adaptation of program activities is urgently needed.

Successful local, State, and regional programs and their related organizational structures need to be identified and communicated elsewhere. Organizational and administrative patterns of vocational education programs already in existence need evaluation. Those that are successful need recognition and communication to other practitioners. Recent trends in general education, such as ungraded schools, team teaching, flexible scheduling, and individualized instruction need to be adapted to the purposes of vocational education.

6. Adult and Continuing Education

The increased emphasis on adult and continuing education is reflected in a substantial number of Federal programs, such as the Manpower Development and Training Act and the Economic Opportunity Act. This rapidly growing field requires definition and improved institutional patterns. Many previous attempts at planning have failed because of the lack of knowledge about the number and kinds of adults presently engaged in educational activities and of the number and kinds of courses and programs available to them. It is not possible to build a sound plan without a more accurate picture of the size and scope of the current enterprise.

Emphasis will be given first to determining the extent of participation in adult and continuing education activities. This undertaking will probably be in the nature of a census which will provide more reliable data on the numbers of adults participating in specific kinds of educational activities.

A second undertaking of equal importance is the assessment of the kinds of courses and programs for adults currently available in this country. Substantial programs in adult education are carried on by such diverse agencies and organizations as departments of the Federal government, colleges and universities, junior and community colleges, proprietary schools, industrial firms, labor unions, public school systems, libraries and museums, and voluntary organizations of various kinds. It is necessary to understand the nature and scope of these offerings before attempting the design of future large-scale programs for adults.

Research is also needed on the problem of what motivates adults to continue learning and how they learn. It seems clear that both the motives of adults in seeking to learn and the process itself is different from what happens with children and adolescents, but definitive knowledge is lacking.

Emphasis will be placed on the development and evaluation of:

(1) The methods of recruiting and training teachers and leaders for adult and continuing activities;

(2) Ways in which adult education organizations and agencies can be coordinated in bringing their resources to bear on areas in which there is critical need for social action;

(3) Definition of the needs of older persons for broadening their education or learning new work skills;

(4) Educational programs for semiliterate adults to enable them to live more successfully in an urban environment; and

(5) Patterns of organizing and administering new institutions or agencies designed specifically for the education of adults.

7. Occupational Information and Career Choice

One of the severest handicaps to vocational and technical education has been the dearth of relevant occupational data and methods for effective communication of such information. Lack of knowledge about the ways in which career decisions are shaped has all too often led to the selection and preparation of youngsters for inappropriate careers, particularly those who can least afford to make wrong commitments.

Occupational information needs will be met through a variety of studies. For example, new and growing occupational fields will be surveyed to identify skill competencies and training requirements, and to determine future employment needs. Occupational classification systems will be analyzed for possible improvement. The costs of vocational education which are borne by students - such as tuition, transportation, and earnings given up to attend school - will be weighed against the returns to the individual in personal income, job satisfaction, and other benefits.

Projects which relate to improved methods of packaging and disseminating occupational opportunity information will also be sought in order to meet the needs of specific audiences, such as the high school dropout, the slow learner, disadvantaged youngsters, parents, hard core unemployed, etc.

Studies of the process of recruiting and selecting counselors and the entire process of vocational guidance and career choice are also important. We need to expand counseling practices which provide occupational information to the non-college bound student. We need to assess counselor competencies and to develop methods for their upgrading.

A limited number of additional projects which do not fall in one of these seven priority areas may be funded if conditions warrant support of such programs.

May I repeat again that it is a pleasure for me to participate in this seminar. We have a challenging opportunity before us. I feel confident that our experiences here will contribute greatly to our ability to more adequately serve vocational and technical education.

DEVELOPING PROPOSALS FOR FUNDING RESEARCH AND DEVELOPMENT PROJECTS

by John K. Coster
Professor of Agricultural Education
and Educational Administration
University of Nebraska

In enacting the historic legislation, Public Law 88-210, the Congress of the United States clearly enunciated the position that the research and development activities and efforts related to vocational and technical education are to be elevated to full partnership with instructional, supervisory, and teacher education activities. Not only is the U.S. Commissioner of Education required to withhold 10 percent of all monies appropriated under the authorizations of the Vocational Education Act of 1963 for support of research and development programs, for which applications are made to the Commissioner of Education, but, fully as important, State Boards of Education are required to use 3 percent or more of all funds allocated to their respective States for ancillary services, which may include state supported research and development programs.

The impact of the Act of Congress to provide for and stimulate research and development activities, and the translation of this provision into operational machinery for the stimulation and administration of research and development programs at the National level, within the Office of Education, originally in the Occupational Research and Planning Program of the Division of Vocational and Technical Education, and more recently, following the reorganization of the U.S. Office of Education, within the Division of Adult and Vocational Research within the Bureau of Research, has stimulated one of the most exciting eras in the history of vocational and technical education. The idea is the thing, and the staff of the Division of Adult and Vocational Research, a staff of dedicated, competent, well-trained, and hard working professional educators, has set into motion the plans and operation for searching out and putting into operational form ideas which may be translated into proposals, and the proposals translated into plans of development, research and training, which, when completed, may be expected to improve the quality of future programs of vocational and technical education and occupational preparation and retraining.

Policies and procedures have been set up so that any person interested in vocational and technical education or in supporting disciplines which may relate and contribute to vocational and technical education may participate in research and development activities, and may apply for Federal support. Applicants for Federal support include persons or agencies representing local school corporations, state departments of education, universities and colleges, and not-for-profit educational agencies and foundations. Underlying the entire program, I believe, is the tacit assumption that no one person or type of person, or that no one agency or type of agency has a

monopoly on ideas, and that there should be a clear-cut set of policies and procedures developed which will encourage the ideas in proposal forms for support as research and development projects.

At the outset it should be pointed out and emphasized that the proposals which will be recommended for financial support from funds authorized under Section 4(c) of the Vocational Education Act of 1963 will be the proposals which will, in the judgment of members of the review panels and the U.S. Commissioner of Education, have the widest possible impact on the program of vocational and technical education in the nation. Innovation and generalizability, therefore, are two of the prime requisites of an approvable proposal. For this reason, strong emphasis should be placed on the importance of allocating adequate funds at the state level to support research and development programs wherein the primary focal points of interest are restricted to state and local programs. Many states already have allocated a portion of funds for research and development activities. In Indiana, for example, the State Board of Vocational Education passed a resolution authorizing $15,000 in Fiscal Year 1964, and $40,000 thereafter to be assigned to research and development programs for which local school corporations or colleges and universities could make application. The action of this Board, together with the actions of other boards, preceeded the action of Congress to make funds available for the support of research and development activities as is provided under the provision of Section 4 (c) of the Vocational Education Act of 1963.

The action of Congress to make Federal funds available for the support of research and development programs does not negate the importance of providing financial support of programs within the several States. The provision of funds for ancillary services, which are available to the several states, and which, at the discretion of the State Boards for Vocational Education, may exceed the minimum of 3 percent of Federal funds allocated to the States, provide states with additional resources for research and development activities, and judicious utilization of these resources within the States should be encouraged to the fullest extent possible.

Returning to program operation at the national level, I am pleased to report that, in my opinion, there is no evidence of a paucity of ideas for research and development projects in the research, training, developmental, experimental, and pilot programs. On the contrary, there has come forth from teachers in the field and from experienced researchers, from personnel in State Departments of Education and from established research organizations, from the experienced researcher and from persons who are submitting their first proposal for consideration, a large number of intriguing, innovative, practical, and researchable ideas, which have been approved or are in the process of being approved, and which, I believe, will further vocational and technical education in the United States. But even though I argue that there is no paucity of ideas for research and development, I would hasten to add that, in my opinion, there is evidence of a paucity of time allocated to persons interested in

contributing to the future of vocational and technical education through the initiation and execution of research and development projects and programs for the full and complete development of such projects. Funds for research and development programs provided at Federal and State levels should be regarded as an instrument of progress to be allocated to proposals upon which adequate time has been devoted for their full and complete preparation.

Participation in research and development activities is not the sole responsibility of the nucleus of educators who are assigned to these activities by reason of interest and academic preparation, or who wish to make their principal contributions to the continued improvement of vocational and technical education through research and development activities. These responsibilities must be shared with all persons responsible for the administration and organization of vocational and technical education.

If progress is to be effected in vocational and technical education through research and development programs, it is imperative, therefore, that persons interested in making their contributions to the future of vocational and technical education through these avenues be identified, adequately prepared, and supported in their efforts. Not all vocational educators are interested in these activities. But the process of progress is a team effort to which all persons may contribute. The climate for research and development which is created and maintained within a State Department of Education or within the teacher education department of a college or university is as vital to the success of the program as the actual participation of the program. Part of the climate refers to the freedom of operation which is granted to the researcher or developer. But freedom must be tempered with integrity, and integrity dictates a dual dimension. On the one hand integrity associated with freedom demands that the researcher or developer selects problems which are relevant, vital, and essential to the welfare of society. And on the other hand, integrity refers to the wise and judicious request for and management of financial resources available for the development of ideas. It is imperative that financial resources appropriated from federal and state or private funding sources be regarded as instruments of progress as translated through the human resources available to the researcher, and it is equally imperative that the researcher regard his own abilities as instruments of progress which may be translated into reality through the medium of the financial resources which may be made available to him. And both human and financial resources are to be regarded as vehicles for the welfare of society and the individuals to be served through programs of vocational and technical education.

I have been requested to give attention to the elements of developing a proposal for submission to a funding agency, such as the Division of Adult and Vocational Research of the U.S. Office of Education. Education, in America, is quite largely a public enterprise supported with funds obtained from the financial resources obtained by taxation. It is entirely logical that research and development programs related to education be supported from public funds, as are such functions as instruction and counseling. But

whereas funds to support instruction may be distributed on a proportionate per capita basis, prudence dictates that funds for research and development be allocated on the basis of the merits of the proposal and the financial resources needed to assure the adequate completion of the project.

The formal proposal has become the basis which has been utilized by the Federal government for supporting research and development programs. Although the fund administration agency, such as the Division of Adult and Vocational Research, may establish priorities and suggest areas of research and development, the major responsibility for the initiation of a proposal rests with the individual researcher or developer, or, perhaps, a research and development team. As was mentioned earlier, the idea is the thing. But it is imperative that the idea be developed to the extent that the initiator communicates clearly to the person or persons who are called upon to render professional judgments regarding the suitability or feasibility of the program, details regarding the nature and importance of the idea or problem, the objectives to be attained, and the procedures to be used. In short, the proposal must show that the initiator knows and understands exactly what he proposes to do, what work has been done previously that bears upon his problem, and how he plans to proceed. I have selected seven elements of a sound proposal for further treatment.

A. The Development and Elaboration of the Problem

The development and elaboration of the problem includes the translation of the initiator's idea into the statement of the problem, the presentation of supporting evidence in the form of review of related literature, the formulation of a theoretical framework or construct, rationale, or model, and culminates in the statement of the objectives of the study.

The problem. I suggest that the problem be stated in broad terms at the beginning of the proposal, preferably in the first paragraph. The statement of the problem may be followed by supporting arguments for the importance and significance of the problem.

The review of literature. Ideas are not generated in a vacuum. They emerge from a chain of experiences based upon the initiator's own experiences and the experiences of others. It is essential that this chain of experiences be woven into a workable rationale which sets forth the observations, experiences, and research and development background from which the central idea sprung, and which will point to the direction that the research, training, or development program will take. The review of literature that is requested in the Conditions and Procedures, OE-4262*, for projects to be submitted under Section 4(c) of the Vocational Education Act of 1963 serves as a basis for reviewers to ascertain the extent to which the initiator has devoted time to determine what research and development programs have been completed which impinge upon the central idea or problem from which the rationale or framework is to be based. No proposal is regarded

*Conditions and Procedures: Grants for Research Training, Experimental Development or Pilot Program - Vocational and Technical Education. OE4262, U. S. Department of Health, Education and Welfare, Office of Education, Washington, D. C., 1964.

lightly, but proposals which do not include adequate evidence that the initiator has given adequate attention to previous work tend to fall short of acceptable standards for approval.

The rationale. The rationale, theoretical framework or construct, or model is a brief conceptualization of the problem, based on the problem itself and the review of related studies. In more basic studies, the rationale consists of the theoretical statement that the initiator wishes to test. In applied research, the rationale consists of an operational statement of the proposal. In experimental, developmental, and pilot programs, the rationale consists of a descriptive statement of the innovation. The rationale essentially is a transition step in the chain of logic in which the initiator bridges the gap between the previous work to be done and the objectives of the proposal in which he conceptualizes the basis of the problem.

The objectives. The development and elaboration of the problem culminates in a statement of objectives of the proposal. The objectives should be stated as succinctly as possible. When appropriate, they may be stated as questions to be answered, or, in the case of statistically designed studies, as hypotheses to be tested. The objectives determine the direction of the project, guide the selection of appropriate procedures, and serve as the basis for the selection of the evaluative procedures which will be discussed in a subsequent subsection.

B. Innovation

The second element to be considered in a proposal is its innovative qualities. Innovation is especially important in training, experimental, development, and pilot projects. If the proposal is not innovative, if it represents work which has been ongoing for a number of years and in a number of schools, then it is reasoned that the idea contained in the proposal should be part of the ongoing educational process of schools, and that the program should be funded from regular federal, state and local funds.

Training proposals should represent a new dimension in the preparation of vocational and technical educators or in the development of training programs for prospective and present workers. A regrouping of existing courses at either college or high school levels does not meet the innovative criterion. Nor is it necessarily innovative to indicate that the future of vocational and technical education will be expanded if stipends are furnished to trainees. The policies regarding stipends at present have not been clarified inasmuch as the Vocational Education Act of 1963 does not provide for stipends. This policy may be modified in the future. But even if the policy is modified, and stipends may be made available to trainees, it seems imperative that the training program itself should be innovative, and that the programs offered should represent a new

and distinctively unique thrust into the preparation of vocational educators and other persons who reasonably might be expected to receive further training under the provision of Section 4(c) of the Vocational Education Act of 1963.

Essentially the same criterion may be applied to experimental, developmental, and pilot programs. These programs are essential in the total research and development program both for trying out and testing new ideas and for demonstrating the findings of significant and relevant research. It is imperative that the most creative persons in vocational education be encouraged to develop these programs. And in many cases, these persons may be found in the ranks of the vocational teachers. Many innovations in vocational education in agriculture, for example, had their inception in the imaginative behavior of vocational teachers. Members of supervisory and teacher education staffs should attempt to identify the creative, imaginative teachers, and encourage them to develop their innovative ideas. Ancillary funds avilable to the states might well be used to fund a portion of these teachers' time to enable them to develop their ideas into proposal form. Too frequently, the experimental, developmental, and pilot programs that have been submitted represent an innovation only to the specific school system submitting the proposal, and in actual practice the idea has been tried and tested in other schools.

C. Significance of the Proposal.

The third element refers to the significance of the study, and, particularly, to the significance of the proposal for vocational and technical education. The first criterion applied to the evaluation of proposals, as set forth in OE-4262, calls for a judgement as to the significance of the proposal to vocational and technical education.

As the research and development program administered by the Division of Adult and Vocational Education develops, it is hoped that an optimum balance will be achieved between basic and applied research, and among research, training, and experimental, developmental, and pilot programs. Undoubtedly, there is both the need for and interest in research and developmental programs which involve the related disciplines which support and give depth to vocational and technical education programs. But if the research is defined as basic research, it is imperative that a clear-cut relationship be developed between the basic area of the research problem and the furtherance of vocational and technical education. If the proposal deals with basic educational skills, such as reading, it is necessary that the proposal demonstrates how such training is to be related to the preparation of persons for initial entry into the labor force. Hence, if the initiator prepares a proposal which deals with the problem of reading effectiveness of junior high school students, then it is necessary that he demonstrate how this work is to be related to preparation of occupational proficiency or for initial gainful employment at the high school or post-high school levels. It is also necessary to show the evaluative criterion to be used to demonstrate the efficiency of the program.

D. Design or Plan

The design or plan, or procedures, in any research and development program should be presented in sufficient detail so that the reviewer of the proposal can ascertain (1) whether the initiator has given adequate attention to planning the procedures by which the objectives of the project are to be attained, and (2) whether the procedures are appropriate for attaining the objectives. Specific points to be emphasized in each of the three types of programs which may be submitted under the provisions of Section 4(c) of the Vocational Education Act of 1963 follow.

Research programs. Adequate attention should be given to the description of dependent variables or criterion measures, to the identification of classification and treatment factors and to their levels, to the experimental design in statistically designed experiments including the test statistics, and to controls of the experiment, such as randomization, classification, and the use of the analysis of covariance. Where the study involves the two traditional levels of a treatment factor, the treatment and the "control," attention should be given as to how the experimental environment or "Hawthorne" effect is to be controlled. Sampling procedures should be explained thoroughly, and if a stratified sample is used, the rationale underlying the stratification should be explained. The population of interest should be clearly defined. Research programs may assume a variety of forms, such as historical research, sample surveys, descriptive studies, predictive studies, analytical studies, and statistically designed experiments. But they have in common, tightness and adequacy of design, adequate delimination of the scope of the study, adequate attention to procedures, and the selection of appropriate methods of analysis and test statistics.

Training programs. In the design or plan of training programs, emphasis is placed on the content of the training programs. Adequate rationale should be developed in terms of the appropriateness of the content, how the training program is innovative, how it is to be organized, and modes of presentation.

Experimental, developmental, and pilot programs. The design of experimental, developmental, or pilot programs should give adequate attention to the design of the programs, the subject -- schools or individuals -- for which the program is appropriate, the methods and materials to be used, and the details of the plan of operation. Even though the developmental features of these programs will likely be a part of the process of the program -- for example, one of the objectives of the program may be to develop new curriculum materials in response to a specific problem of interest -- the general feature of the materials should be specified in the plan of operation. The programs feature, generally, a concentration of fiscal and human resources on the locale of the study, but prudence in the use of Federal funds to support such programs dictates that the value of the program extend beyond the locale of the study. Hence, it is imperative that the description of the program relate the locale to

a general class of locales, and that the generalizability of the program be emphasized.

E. Evaluation

Evaluation refers both to the methods or techniques of collecting data to be used in measuring the effectiveness of the program and to the selection and/or preparation of appropriate instruments of criterion measures or dependent variables.

Evaluation is a weakness inherent in most of the proposals which have been submitted. This is especially true of most of us whose background has been in vocational and technical education. Our training in measurement and evaluation has been limited largely to one or two courses in test of measurements offered as part of a master's or doctor's program. Regardless, if the proposal which we are preparing is a research proposal or an experimental, developmental, or pilot program, we are hypothesizing, in effect, that an effect or difference in gain in some aspect of human behavior is likely to result from the program or treatment which we envision, and we must be prepared to show how this effect is to be measured. In a research program, we normally would accomplish this end by setting up a project designed to evaluate the effect of two treatments on the dependent variable or variables which are to be measured.

The data obtained from the experiment may be analyzed by an appropriate technique such as the analysis of variance, and an appropriate test statistic may be applied to determine whether the effect approaches a predetermined standard which is set by the experimenter. In developmental, experimental, and pilot programs, the effect, that is the difference in gain, related to the dependent variable or criterion measure is more difficult to detect. One school, for example, does not constitute a sample, and the use of typical statistical procedures is not especially appropriate for the single program. Further, a pilot program represents something special. Attention is focused on the pilot program, people are involved and interested in it, and this involvement or interest in itself is likely to produce an effect. Yet it is possible to apply a reasonable degree of objectivity in the evaluation of the effectiveness of an experimental, developmental, or pilot program. Norms or standards may be established, based upon the past history of the school, or based upon established norms which are available for standardized tests. The researcher may determine on the basis of his best judgment the standard he would be willing to accept as evidence of the effectiveness of the program, taking into consideration both the nature of the program and the likely effect which may be attributable to the special involvement of the professional staff, the students, and the community.

Perhaps the most difficult part of the evaluation of the results of the program rests in the relative absence of standardized tests. New tests may need to be developed, and when these new tests are developed, standardized norms are not readily available. If this is the case, then it is necessary to demonstrate how the tests are

to be standardized, and how the results are to be used in the evaluation of the program. Not all outcomes can be, nor should they be, measured against standardized tests. In one study, the development of a procedure was proposed as one of the basis of evaluation. Also involved in the evaluation was the number of persons to be enrolled in vocational programs in the school, and the increase in dollar investment in vocational and technical education which might be attributable to the involvement of the people in the program.

In many instances it is desirable that the evaluation procedures not terminate with the termination of the formal training program. It is desirable that follow-up measures be taken in order to determine whether there is any evidence of permanance of the effect generated. The length of time of follow-up measures may be somewhat difficult to set as an absolute minimum. It probably would be desirable if the program deals with high school students to evaluate the program at the end of ten years. Most projects will not run for this length of time. Follow-up measures taken at the end of two years would certainly be superior to evaluation at the termination of the formal instructional period.

F. Personnel and Facilities

The fifth relative absolute pertains to adequacy of personnel and facilities. It is not necessary that each person initiating the proposal be regarded as a national figure in research and development in education or in vocational education. Each of us must get our start somewhere along the line. From a tactical point of view, it perhaps is desirable to initiate a research and development program with a relatively modest proposal. But if the project calls for a much larger budget in order to assure the effectiveness of the proposal, some questions regarding the competency of individuals conducting the proposal may be alleviated by ascertaining that at least one member of the research team be a person who has demonstrated proficiency in research and development. Wise and judicious use of consulting personnel is another technique which may be used effectively to demonstrate that competent advice regarding the development of the problem is available to the researcher. Narrative descriptions of the qualifications of the key personnel are desirable, but it is equally desirable that adequate evidence regarding the competency of the key personnel be supported with references to the previous research work of the individual.

In defining the qualifications of the personnel, modesty is no particular virtue. Lists of publications which support and attest to the experience and qualifications of the key personnel are extremely desirable. Few proposals are denied support due to inadequate facilities. But it is equally important to demonstrate that the researcher has the necessary sources available to his disposal in order to assure the successful completion of the project.

G. Economic Efficiency

The last element relates to the economic efficiency of the project. The economic efficiency of a project is a matter of judgment. But

the judgment is based upon experience. It is extremely important that the project not be overpriced. Excessive and unnecessary replications are to be avoided. Hence, if a project is designed to evaluate the effect of a methodology or materials on some dependent variable of interest, one or two replications may be adequate, and nothing much may be gained by running the same project for two or three years. Fortunately, the contracts and grants section of the Division of Adult and Vocational Education has taken the highly enlightened view of contractual arrangements, and while questions regarding specific items may be raised, there nevertheless is intense desire to ascertain that the budget is adequate in order to obtain the objectives of the program.

I have enumerated elements of a sound proposal. To a certain extent these elements relate to the weaknesses which have been observed in a number of proposals. The limitations cut across the board and are not pertinent to any single discipline in vocational education. With regard to weaknesses, agricultural education does not differ from the other vocational fields. Time has been spent in the development of research competency among agricultural educators in the regional research conferences which have been in effect throughout the nation for a number of years, and through the national seminars on research in vocational education as has been reflected in the relatively large number of proposals funded from the agricultural education group. The problem of assigning adequate time to research and development as a part of the individual's work assignment applies to agricultural education as well as to the other fields. If agricultural education is to continue to assume leadership in research and development, it is imperative that staffing assignments be re-examined and the persons who are interested in research and development be assigned activity for this area. In my estimation, the most creative minds in the vocational education field should be assigned and channeled into the area of the developmental, experimental, and pilot programs.

Even though a relatively large number of proposals have been approved in which the key personnel represent vocational education only, I am inclined to believe that a far greater impact upon the future of vocational and technical education may be made through the involvement of the related disciplines in such fields as sociology, economics, and psychology to the problems of vocational and technical education. The problem of motivation, for example, is a persistent problem in vocational education, and here we may well rely upon and build upon the research of the sociologist. Although the educational psychologist does not necessarily have a monopoly upon measurement and evaluation, it seems reasonable to assume that any measurement and evaluation program may be augmented through the establishment of a working relationship with personnel who are trained as educational psychologists. The team approach to conducting research generates problems in itself, but if the team can be marshalled and organized toward the goal of the project, then the outcomes may more than offset the problems of team research.

Summary and Conclusions

It was suggested that attention be given to some specific suggestions for preparing proposals. I should like to fulfill this assignment by first listing some positive suggestions, then re-emphasize some of the points which have been mentioned by presenting a list of points to avoid in the preparation of proposals.

A. Some Positive Suggestions for the Preparation of Proposals

1. Start with a significant problem or innovation, and build a logical and coherent chain of reasoning and experiences for the statement and elaboration of the problem through the objectives, procedures and evaluation. State exactly what is to be done in a straightforward manner.

2. Delimit the problem to a manageable part of the area with which the problem is concerned, but demonstrate generalizability.

3. Show the experiences from which the problem evolved, present and analyze relevant studies, and state the rationale or model which is to serve as the basis of the study.

4. State the objectives succinctly.

5. Detail the procedures to denote clarity at each step.

6. Show that the treatment to be used, the training program to be offered, or the innovation are significant, appropriate, and operationally feasible.

7. Use an appropriate design which will permit the testing of hypotheses and the control of extraneous variables, with adequate attention to populations and samples.

8. Work out a complete plan of evaluation and measurements. Show how instruments are to be constructed, if new instruments are needed.

9. Integrate objectives, hypotheses, procedures, and evaluation.

10. Show adequacy of personnel. Use consultants where needed. Specify names of personnel, and avoid large scale listing of qualified specialists who have not been contacted to serve as a consultant on the project. List completed studies and publications of key personnel.

11. Price the project judiciously.

12. Show how results are to be disseminated.

B. Some Points to Avoid in Preparing Proposal

1. Don't write in terms of generalities. Avoid such phrases as "Much has been written," "It is a well-known fact," "This is a new and unique idea."

2. Don't start the proposal by the tearing down process. All that has happened in the past is not wrong or inadequate. Build on the good, the sound, the known. Show deficiencies or weaknesses which are of interest in the proposal, but use these elements as appropriate points of departure for the study.

3. Don't try to include everything in one proposal. Delimit and select the important elements which represent the greatest concern.

4. Don't delimit the generalizability of the project. The locale of the study should be somewhat incidental. The selection of the schools, if not selected randomly, should be made on the basis of representativeness to a number of comparable schools throughout the state or nation in which the innovation might have possibilities.

5. Don't assume knowledge of the problem on the part of the reader or proposal reviewer.

6. Don't build a project around a single instrument or even a group of instruments.

7. Don't use the 4(c) funds to support instructional programs that should be carried out as part of the ongoing vocational education program. Do apply for support to innovate, develop, evaluate, and demonstrate.

8. Don't expect a small idea to carry a large budget in a developmental, pilot or experimental program.

9. Don't fail to budget for specialized personnel, if needed.

10. Don't extend the duration of a project for an unnecessarily long period.

11. Don't be hasty. It is better to miss the deadline than to have a proposal disapproved.

12. Don't ignore the Condition and Procedures, OE-4262.

Nearly a half century has elapsed since the enactment of the Vocational Education Act of 1917. We in vocational education have concentrated largely upon the operational and instructional phases of the program. We have prided ourselves on being practical educators, and we have not assigned an adequate proportion of our time

Summary and Conclusions

It was suggested that attention be given to some specific suggestions for preparing proposals. I should like to fulfill this assignment by first listing some positive suggestions, then re-emphasize some of the points which have been mentioned by presenting a list of points to avoid in the preparation of proposals.

A. Some Positive Suggestions for the Preparation of Proposals

1. Start with a significant problem or innovation, and build a logical and coherent chain of reasoning and experiences for the statement and elaboration of the problem through the objectives, procedures and evaluation. State exactly what is to be done in a straightforward manner.

2. Delimit the problem to a manageable part of the area with which the problem is concerned, but demonstrate generalizability.

3. Show the experiences from which the problem evolved, present and analyze relevant studies, and state the rationale or model which is to serve as the basis of the study.

4. State the objectives succinctly.

5. Detail the procedures to denote clarity at each step.

6. Show that the treatment to be used, the training program to be offered, or the innovation are significant, appropriate, and operationally feasible.

7. Use an appropriate design which will permit the testing of hypotheses and the control of extraneous variables, with adequate attention to populations and samples.

8. Work out a complete plan of evaluation and measurements. Show how instruments are to be constructed, if new instruments are needed.

9. Integrate objectives, hypotheses, procedures, and evaluation.

10. Show adequacy of personnel. Use consultants where needed. Specify names of personnel, and avoid large scale listing of qualified specialists who have not been contacted to serve as a consultant on the project. List completed studies and publications of key personnel.

11. Price the project judiciously.

12. Show how results are to be disseminated.

ARE WE ASKING THE RIGHT QUESTIONS?

by
Lester S. Kellogg
Director of Economic Research
Deere & Company

Introduction

Gentlemen--I, too, along with the other speakers, am pleased to be here. The sessions so far have been most interesting, and I regret that I will not be able to complete the whole week with you.

Your work and the subject of this Seminar are, I assure you, of great interest to Deere & Company. All of you know John Deere, I am sure, and most of you have been acquainted for many years with members of our organization who have spent their lives in dedication to agriculture, and some of them especially to vocational agriculture. Those of you who have taught courses in vocational agriculture have, in nine cases out of ten, probably used our textbook, "The Operation, Care, and Repair of Farm Machinery," which, I am told, continues to be one of the outstanding textbooks for high school use in farm mechanics.

Deere wants to continue to help in education for agriculture and will watch with interest the continued results of your efforts and especially those which will be directed in the future to research in vocational agriculture.

In speaking to you here, I speak as a member--a free, responsible member--of the Deere organization. I represent the Company only in a sense; I do not speak for the Company as such, nor does any other member of our organization do that. During my working career I have been employed by several large universities, the Federal Government, and one big, private enterprise. Of all of these, I have enjoyed greatest freedom in the latter. It is with the responsibility that such freedon requires that I speak to you sincerely this afternoon.

The subject of my talk, in the light of what I have heard so far yesterday and today, leads me to believe that I should have added a subtitle. If I had, my talk should be entitled, "Are we Asking the Right Questions--or Are We Letting Our Biases Show?"

"Are we asking the right questions?" can only be answered in the context of our objectives--our goals. Perhaps this paper should start by asking the more basic question, "Have we established the right goals?"

This is a seminar, according to Bob Taylor, on "Program Development and Research in Agricultural Education." It is organized under the banner of The Center for Research and Leadership Development in Vocational

and Technical Education. These are words. I find myself somewhat baffled by them so that I've concluded for myself that you are here because you believe that vocational education is important--perhaps essential for some goals. Your major, real interest, though, is in vocational agriculture, and, more importantly than anything else, in how to be successful in dipping in the public till. In fact, most of you set out to engage in vocational agriculture--teach probably--and now find it necessary to change your directions--to initiate, participate in, even direct research, mainly because money is available. But how do you relate research to these changes? What kind of research do you really want to do?

If I were in your position and having to change direction, I should choose that path which should take me toward serving the greatest need. Is the purpose of your research to provide the guide lines--the navigational markers--to meet these needs? If so, the research that will point toward desirable objectives has largely been done. To the extent that the necessary research is still incomplete, the major gaps can be quickly filled. So what are the major questions--the major right questions?

You will say pilot studies--developmental guide lines--but are you philosophically really ready to accept what your research may suggest?

Several years ago, my attention--quite by accident--was directed to the court-martial questioning of Brigadier General Billy Mitchell. I have found it extremely stimulating and perhaps appropriate for the kinds of discussion under way here.

Remember--and some of you will--that in 1925 General Billy Mitchell was court-martialled for insubordination for the way he criticized his superiors for their failure to see the future of air development as clearly as he could see it. Listen to the following sample of questions put to him and his answers:

Prosecutor: You say that "In future wars soldiers will invade by leaping in parachutes from airplanes." Would you care to reveal who gave you this startling information?

Mitchell: Nobody gave it to me. It's quite obvious to anyone with the slightest foresight.

Prosecutor: It is your actual belief that this country is vulnerable to attack from the air?

Mitchell: In the foreseeable future.

Prosecutor: Colonel Mitchell, do you have any idea of the width of the Atlantic Ocean?

Mitchell: Approximately 3,000 miles.

Prosecutor: You say that "Airships traveling 1,000 miles an hour will fight each other in the stratosphere." Have you any comprehension how fast a thousand miles an hour is? Do you know that it is faster than the speed of sound?

Mitchell: Approximately 250 miles faster.

Since a good deal of my work relates to the long look ahead for agriculture and the farm machinery industry, I am going to show you a few charts and then describe what projections of the trends may portend. Usually I use these charts in the context of the implications of the long-range projections for agriculture and our industry and management groups. In this instance, I shall tell you briefly what they seem to say to management, and I will raise questions for you about what the trends may say about whether you are "asking the right questions."

United States Population

We all know that U. S. population continues to grow at a rapid rate. By 1980--just fifteen years away--we can expect a population of 240-280 millions. The figure is more likely to be in the neighborhood of 250 millions. In the next fifteen years we will add one-fourth as many people as in our whole history to date. That's a lot of people! Since my birth, the population has increased some 125 percent!

For management, such a growth in population indicates that the demands for agricultural products will continue to grow. To satisfy such demands will require continued growth in agricultural demands for capital and supplies.

For you vocational educators, the population growth also reflects increasing demands for all of the goods and services required by an increasingly affluent society, rural and urban. To satisfy these demands will require workers with the education, training, skills, and qualities necessary to support the growing affluence. This broad area of demand will obviously be the greatest challenge that can be laid down for those of you responsible for education--elementary, secondary, vocational, collegiate, graduate and adult. Of all the demands an increasingly affluent society will make, those for various kinds of services will be greatest. To satisfy such demands requires of those who serve--in addition to skills developed through vocational education and training--understanding and willingness to serve. Closely associated with willingness to serve are those personal qualities of health, grooming, patience, courtesy, etc. The youth of every sector of the economy must be challenged, including those from rural areas, to whom most of you have dedicated your efforts.

Exports of Farm Products

The United States--in fact, North America--in the future will supply--in addition to the demands of its own population--the demands for food and fiber of many other parts of the world. Casual observation should confirm--detailed study will convince--that, at current and near-future rates of population growth, most other parts of the world are not able--and will not be able in the foreseeable future--to meet the demands of their people for their subsistence--let alone good health and longevity. Exports from North America will increasingly, as time goes on, help meet these needs.

For management, this means added support for increasing demands for highly productive farm machinery and equipment.

For you, it adds several dimensions to the education and training of young people and adults and should provide additional incentives for the exercise of many different aptitudes. As we talk about exports and

assistance to foreign areas, it is essential that we know something about those areas, that we can communicate with people of different tongues, and that we have some understanding of governments, of different economic systems, and of their basic laws. The detailed specifications of the education and training involved in these requirements, I leave to you. This may need research. This challenge alone is great. "Are you asking the right questions to understand and meet it?" I haven't heard them.

Farm Population

Farm population has been declining steadily from its peak in the mid-thirties. It will contine to decline, and, in fact, as a description of a portion of our total population, it may disappear. If we were to define for the next fifteen years farm population as a total number of people living on what we will define as farms, the total by 1980 might be as small as 8-10 million.

In 1960, 8 to 10 percent of our total population was so classified; by 1980 the proportion may be as low as 3 1/2 to 5 percent. In England, the most advanced country in the world in this respect, the farm population amounts to 4 percent or less now.

For management, this means fewer customers and fewer easily accessible machinery operators. It suggests the need for more powerful, more flexible, more functional and chore-saving farm machinery and equipment.

For you, it has several meanings. The number of young people of farm origin is declining so fast that the historic job of vocational agriculture must take on new meaning. If the young people now living on farms are to be educated, trained, and stimulated to prepare for the tasks which lie ahead, they should not be misled by devoted vo-ag teachers who, "worshipping at the altar of tradition," to quote Professor Phipps, have in the past provided such great stimuli for such young people to prepare for work on the farms. The opportunities for work in agriculture per se in the future will decline, but the opportunities for servicing this highly productive enterprise in the same ways that urban demands are met will increase. In the future there will be little distinction in the demands for service and the supply of commodities as between those engaged in agriculture and people engaged in other major productive activities. If this statement is true, the services demanded can equally well be provided by the well-educated, trained, and

stimulated children of farmers, of farmers who have left agriculture in the last decade and now live in urban areas, or of those of the rest of the urban population, since the distinctions we accredited to agriculture for so long will have largely been dissipated or diffused. In fact, one of my major frustrations here is education vs. agricultural education

Major Land Uses and Acres in Farms

From these charts several conclusions about the future emerge. The total U. S. Land areas is relatively fixed. The total land in cities, highways, airports, and forest lands --much of which will be in parks or greens, as the Europeans say -- will increase. Nonfarm grasslands will continue to decrease; pasture and other farmland will decrease slowly; and cropland planted and harvested in the next fifteen years may continue to decline. As areas for cities, highways, and airports expand to serve the growing population, land will be taken -- usually from cropland. This, in turn, will put a draft on current farmland. This movement can go on, without greatly affecting the efficiency of our agricultural production, for a number of years.

For management, the shifts in the use of land within agriculture and among the several alternate nonagricultural uses provide further support of demand for earth-moving and other types of machinery and equipment heretofore thought of as agricultural.

For you, it provides some broad bounds for imaginative thinking about uses of land which, until recent years, have been left largely to the U. S. Department of the Interior, to city planners and zoners, and urban real estate developers. As demands for recreation and the use of our natural resources for growing populations increase, additional dimensions will be added to requirements for basic education, specific training, and vocational education which will require detailed attention. These demands, of course, can be supplied -- shall I say, equally well, and if not, why not -- by people who have been reared in urban as well as in rural areas. There is no advantage that one can discern superficially for providing such training by one group as against another.

Number of Farms

This chart makes clear that number of farms, as defined by the Census, reached a peak by 1920 and then started to decline. The decline was arrested briefly in the thirties, when, during the Great Depression, people who had left the farms returned -- usually young people -- returning to

their relatives' homes until they could again pick up their off-farm activities. The downward trend has continued since the end of the depression and may decline to some place between 1 1/2 and 2 million units by 1980. The number of large farms will increase; the number of small farms will decrease greatly.

For management, these trends provide an additional reason for a great decline in the number of customers, but for higher powered, faster, more productive machinery and for greater understanding of the specialized and industrialized agriculture which will move ahead at a fast pace.

For you, these trends make clear that there will be fewer owners and operators of farms. Fewer of the young people now studying agriculture will have the chance to own or even to operate agricultural enterprises. The specialization and industrialization of agriculture will require less general but more specific basic education and specific training. It will put greater demands upon the kinds and quality of service required to maintain equipment. The management of the amount and nature of resources involved will be only slightly different for agricultural enterprises than for enterprises in other industries. From the management point of view, the distinction between the management of an agricultural enterprise and any other kind of enterprise will continue to diminish.

Apropos this discussion, consider how Paul C. Johnson of The Prairie Farmer[1] says it:

> "Consider this! The quantity and quality of farm production will continue to grow as our population grows. Somebody will be needed for this important work. As the capital requirement of a good going farm climbs to $100,000 and even $250,000, it will be harder, in fact nearly impossible, for a farm operator to own all his land. There are few people in big business or in the professions who can put together that kind of money in a lifetime. So we may have to give up the idea of owning all the land we operate. But somebody will be owning that land, and whoever owns it will have to find someone to operate it skillfully. A sloppy job won't do because taxes and interest are too high.
>
> "I predict that in the future management, not ownership, will command the highest price. This is already true in corporate business. Farmers are getting older. Before long there will be a shortage of good ones who are able to deal with the complexities of modern farming.
>
> "Farmers of the future will be well paid, but they must be equal to their task, which is a big one. They'll need brains and education, plus a knack for management. I know

---

1 Johnson, Paul C., "What Does the Future Hold for Farm Youth?" The Prairie Farmer, Illinois Edition, June 19, 1965, p.17.

many successful older farmers who have very little schooling but who achieved self-education in one way or another. But such a course will be much, much harder in the new generation. Therefore, everyone who intends to be a farmer should have a high school education, and he can't stop there. If he can't go on to college he will have to continue his schooling with night classes, short courses, field days, and much reading and studying."

Agricultural Employment

The trends in agricultural employment -- whether we talk about the total hired workers, or family workers -- have been steadily downward, except for a brief period in the early 1900's. A mathematical projection of these trends would read zero shortly after 1980. It is clear that we cannot depend upon such a projection, but it is equally clear that there will be further substantial declines in employment in agriculture. The effects of new legislation and increased agricultural productivity in the recent past are clearly evident in the decline from the preceding year in agricultural employment, during the past fifteen months. In the last fifteen months the decline from the same month last year has been continuously in the neighborhood of 9 to 12 percent; for many years the decline has been at an annual compound rate of approximately 3 percent.

For management, these trends have been both effect and cause. The declines over the years in agricultural employment, to a great extent, have resulted from the introduction of new and more productive farm machinery and equipment. To the extent that in some instances the supply of new equipment has been ahead of the demand, the adoption of such new equipment has been the cause for further declines in employment. The current difficulties faced by those managing agricultural enterprises in obtaining labor and sufficient skills to meet their needs have provided additional incentives for labor-reducing or eliminating equipment. There is still a long way to go.

For you, these trends are convincing confirmation of the rapid declines in opportunities for individuals to work in agricultural enterprises per se. It is in this area that you must give most perceptive thought to the specific needs in the future for basic education, training, and the provision of a great variety of services, since it is so difficult to indicate what the specific requirements of the future will be.

Folke Dovring[2] raises another aspect of this problem. He says:

> "The most obvious consequence for rural areas is the thinning out of their population. When farmers become fewer, so do also many other groups of rural residents -- the service people who get fewer customers. Even though the aggregate gross income of farmers in a given area goes up, as it will in most areas, a larger part than before is spent on production requisites that, more often than not, are produced outside the areas. In addition, with country towns declining and transportation improving, farmers are likely to spend more of their net incomes in medium-sized cities at some distance from where they live, which still further reduces the scope of commercial and service activity in the country town. Thus the local tax base may shrink, and the cost of community services may go up. All of these disadvantages are not large enough to undo the advantages of the substitution of capital for labor in agriculture, but they are serious enough to cause apprehension and to start a search for remedies."

---

2 Dovring, Folke, "When Farmers Become Fewer," Illinois Agricultural Economics. Urbana, Illinois, University of Illinois, Vol. 5 (July 1965) p. 7.

What are the right goals? Are you asking the "right questions" in the research projects you have submitted?

Average Size of Farm

The trend in this characteristic of agriculture, as you know, has been continuously upward. In years ahead it will continue its upward course. Where or when it will stop, nobody knows. Farms are currently being consolidated at probably the fastest rates in history. To project the average size of a farm in 1980 is hazardous; more importantly, it is, to a great extent, meaningless. The reason for this is that the farm is closely related to the nature of the crop, the state of the art, and the extent of knowledge in that particular crop. Closely associated with this problem is the continuous flow of new findings with respect to the most efficient uses of and renewal of our soils, methods of tillage, etc.

For management, this information simply presents, from a different point of view, the confirmation of agirculture's needs for more productive and probably fewer agricultural units.

For you, it should be confirming of the need for greater skill in managing large aggregates of resources. It should raise questions relative to the ways in which resource management can be taught and in what educational areas it will get most attention.

Tractors on Farms

The total number of tractors on farms in the United States has gradually trended up into the early sixties and is now declining. The total, however, has little meaning. The important tractors on farms are those on highly productive enterprises -- and especially those less than ten years old. What I have said is confirmed by the trends in sales to users in recent years. Retail sales have trended downward; the horsepower-per-unit has trended upward; and the total horsepower shipped was held constant.

For management, these trends also tend to confirm what has been revealed already by other trends -- that the demand for tractors per se will decline, but that the total demand for horsepower will continue to be high or to increase in order to provide increased productivity, flexibility of use, and comfort and safety to the operators. It is likely that the total capital expenditure for tractors as prime movers or for engines for self-propelled equipment will more than offset the reduction in the number of units required.

For you, these trends should confirm that there will be great demand for imaginative and able engineers, for skilled workmen, for high degrees of servicing skills since maintenance and repair of such equipment can no longer be done on farms but will, of necessity, be done by specialists with use of industrial-type equipment with high degree of accuracy and precision. This is an area that might benefit from close relationships to industry. The decision to introduce multiple-cylinder tractors was made at Deere in 1953. Servicing labor wasn't ready.

Combines, Pickers, Choppers, and Balers on Farms

The trends shown here are very similar to that for tractors. They simply lag -- usually by a few years -- reflecting later development and delayed farmer adoption.

For management, they add further confirmation of demands for more productive and more specialized equipment.

COMBINES, PICKERS, BALERS & CHOPPERS ON FARMS

SOURCE USDA

For you, they reveal the nature of trends for the employment of operators and support the argument for increased numbers of people with skills to service highly complex agricultural machinery. George Seferovich,[3] Editor of Implement & Tractor, made this point clear when he said:

> "Training tomorrow's farm equipment personnel is becoming a new specialty for technical schools. Latest entrant is the Springfield and Clark County Technical School, Springfield, Ohio. Its program was developed after a study of the industry's needs and with the help of Charles Whitney of the Farm & Power Equipment Retailers of Ohio. The Minnesota area vocational schools continue to develop mechanics for dealers with encouragement and placement help through Ken Austin of the Minnesota dealers' association. A different and broader approach is that of the Agricultural and Technical Institute of the State University of New York at Alfred. Value of higher education to industry is attested to by North Dakota State University survey among its recent ag college grads. Study showed private industry absorbed one-fourth of the 1964 graduating class, up from 22 percent of the 1963 class."

Income from Agriculture

The trend for cash receipts from agriculture has been steadily upward since 1940, and we believe that the trend will continue -- certainly to 1980 and beyond. Such income will be divided among many fewer recipients and will be large enough so that the agricultural enterprise can stand on its own feet to a greater extent than at any time in the last three decades.

For management, these trends indicate that farmers will have the necessary financial basis for steady improvement of their capital investment and for being treated by financial institutions as management units warranting long-range financing.

For you, these trends suggest detailed studies of agricultural operating statements and balance sheets in the same way that such management tools have been studied for other industries. They may indicate that treatment of the agricultural enterprise largely as a family enterprise is coming to an end. Consideration of this problem will lead to many questions relative to the kinds of education and training and attitudes which will be required to meet the demands of the enterprise. Especially important is that you understand that the training of young people reared on farms and that opportunities provided by the land-grant colleges have been and are deficient in this area. To the extent that this is true, managers of

---

3 Seferovich, George H., "What's Ahead," Implement & Tractor, June 21, 1965, p. 13.

agricultural enterprises may preferably be selected from those nonagriculturally oriented institutions of learning which have provided the broad and basic backgrounds and narrower specialized training. Increasingly, as government legistlation -- originally designed for urban industry -- is applied to agriculture, enterprise managers must be trained in such areas.

So much for this set of projections. We could easily expand on their implications for education and training, and we could supply projections of additional variables. Time doesn't permit.

Before leaving this approach, I want to mention several simple warnings --

First, you must try to be objective -- don't let your biases show in doing your research or in making your appraisals.

Second, your job is to anticipate the future so that education and training of young people will prepare them, to the greatest possible extent, for growth and shifts, in order to be prepared for obsolescence of their "knowledge" or skills.

A seminar dedicated to discussing the specific problems you will face -- maybe you've held it -- should be appropriate.

Now, for a couple of minutes, I want to shift directions.

Your group is not basically a research-oriented group. It has been a closely-knit, tradition-bound group, as several of you have emphasized -- nonetheless a good and highly productive one. But you have had little or no experience in asking research questions. So I raise the question, "Can you ask the right questions?"

I know you can't stop your immediate job. You have -- or will have in the next few weeks -- day-to-day responsibilities which must be carried on, and you must think continuously of these jobs. Now, in addition, you are charged with thinking of research and trying to ask questions to which research can be directed.

If you are to ask the "right questions" for which research is essential, you will, it seems to me, be required to take a look ahead at least ten to twenty years. Your research -- if backward looking -- will be mainly history unless it is very carefully done and appraised in the light of the implications for the future. You must look ahead for another reason -- to see if the product -- the vocational-trained boy or girl -- you want to develop is a new one. If it is, keep in mind that you face the same kind of a problem John Deere does. To conceive, design, and test a new product takes time -- not just days, weeks, or months -- but years. To design the new product requires asking questions and attempting to get answers to them. Can you do it? There is a possibility, of course that you can't. In this connection, I am reminded of a story recently told by Secretary of Agriculture

Freeman. A third-grade school teacher, in her arithmetic class, said, "Children, if I lay two eggs on my desk and I lay two eggs on my chair, how many eggs will I have?" Seeing no hands raised, she asked Johnny for an answer. After some thought, he said, "Teacher, I don't think you can do it."

The presentation and discussion I have heard here so far lead me to several observations:

> You are obviously worried about your image. You are on the defensive. It is my strong belief that you have no need to worry about your image if you will update your substance in the way it should be updated. This, of course, means -- asking the right questions.
>
> A second major worry that has been bothering you for a day and a half is, "How do I get on the gravy train fastest?" You haven't called it that, but that is essentially what you are talking about. You have spent the seminar's time -- not on research, how-to-ask questions, or which questions to answer, but rather on "How can I be sure to get my share of the $22 1/2 million earmarked for vocational education?" Maybe you shouldn't get any of it! Maybe it will be best if the $22 1/2 million remains unspent. I have seen no evidence that any amount of money is required -- let alone this great amount.
>
> As an economist, I am worried about your use of the term, "hard money." The diseconomies of hard money may live to haunt you. They may damage your future image. I'd be careful of it. The diseconomies will arise from the hiring of <u>permanent</u> staff to conduct <u>temporary</u> research.
>
> I am also worried about speed. The speed which you are trying to attain can be injurious. Be careful! Don't do research just to be doing research. Do it to solve problems -- and take enough time to do a good job.
>
> I am worried, too, over the need I have heard expressed here for a research program in every state. I have heard similar-sounding projects proposed by representatives from Iowa and Illinois. I live at the state boundary between the two states; I see no differences among the people on either side of the state line. I wonder why we should hazard such duplication of efforts.
>
> One of the major problems you will have -- in addition to asking the right questions -- will be that of determining the directions in which you will go.

Largely offsetting the worries which I have just expressed is the hope that the newly confirmed Secretary of Health, Education, and Welfare, John W. Gardner, will be able to instill in his department the procedures of

"self-renewal" and the standards of "excellence" which he has so well developed in his recent publications. In closing, I quote from his "Excellence."[4]

"In order to help young people in this direction, the following steps are essential:

"1. We must make available to young people far more information than they now have on post-high school opportunities other than college.

"2. Parents, teachers and high school counselors must recognize that if the youngster who is not going to college is to continue his growth and learning he must receive as much sagacious help and counsel as a college-bound student.

"3. We must do what we can do to alter the negative attitude toward education held by many youngsters who fail to go on to college. They must understand that they have been exposed to only one kind of learning experience and that the failures and frustrations encountered in school are not necessarily predictive of failure in every other kind of learning.

"4. We must enable the young person to understand that his stature as an individual and his value as a member of society depend upon continued learning -- not just for four years or a decade, but throughout life."

And now -- as a guide to a philosophy which you might consider accepting -- this is what he says,[5]

"The society which scorns excellence in plumbing because plumbing is a humble activity and tolerates shoddiness in philosophy because it is an exalted activity will have neither good plumbing nor good philosophy. Neither its pipes nor its theories will hold water."

Thank you very much for your patience and close attention.

Promising Research Directions in
Off-Farm Agricultural Occupations

by
Glenn Z. Stevens
Professor of Department of Agricultural Education
The Pennsylvania State University

Twenty-five states have completed comprehensive surveys of off-farm agricultural occupations. Most of them have published reports recently. Pioneering efforts several years ago in five states, California, Michigan, New York, North Carolina and Washington, established a general descriptive research procedure that has influenced all of the surveys. Richly promising new research directions are emerging.

The first needs were to learn what the jobs are, where they are, anticipated changes and trends in employment, and the kinds and amounts of education and training required for entry and for advancement. That information is now available. It is in the process of being disseminated. Interpretation is the next objective.

The initiation of organized state programs of research and the encouragement of formally approved and funded pilot projects in local and area schools, the two major emphases of this seminar, are strongly supported by administrators. New school facilities must be constructed, competent teachers hired, and effective courses planned and taught. Supervision and evaluation are of prime concern.

Instructors must devise course outlines and prepare teaching plans. Coordination with individual on-the-job learning experiences must be arranged for each student, high school and adult. Predictions are that the numbers of commercial farms will remain nearly constant in the next ten years. The competence of farmers must steadily advance. Vocational education in agriculture seldom has effectively reached more than a minor fraction of commercial farm owner-operators. The state surveys of off-farm agricultural occupations have yielded generally a clear-cut likelihood that the numbers of such positions in the total American labor force in which the worker uses agricultural knowledge will increase fifteen to thirty percent in the next five to ten years. This rate of increase closely parallels the expected expansion in the total numbers of persons gainfully employed.

Interviews with random samples of several hundreds of employers in businesses and services other than farming in each state uniformly revealed a readiness, often an eagerness, to become involved in new programs of occupational education. Business and industry surely are not reluctant partners. An amazing clarity of differentiation of employee functions, and of competencies required, was evidenced by the employers interviewed.

A first direction of research in the immediate future should be the classification of job titles by fields of activity and the grouping of subject matter areas by communalities of knowledge, skills and human relations abilities. Businesses have one group of employees whose main function is management. In some, the sales function is closely allied to management. Service occupations normally require the largest numbers of employees. New workers, especially recent high school graduates, often must enter the positions that have the fewest prerequisites of education or training.

Factor analysis of competencies and of job titles is underway in several states. There are many approaches--even numerous variations of the way that principal components analysis using the Kaiser varimax rotation procedure may be applied. As published reports are shared, research workers in the several states now using factor analysis will be able to appraise the usefulness of their findings. It is quite likely that new lists of competencies will be constructed, thus requiring a return to the field for new sampling interviews. The outcomes of descriptive classification prodedures can be no better than the quality of the questions asked. Shrewd, discerning, imaginative ability lists will surely uncover associations that will aid in better course planning.

Multiple discriminant analysis is a promising computer-based technique that will be tried in vocational education somewhere in the near future. It starts with several quantitative measures, such as competency ratings, interest inventory, and ability scores, and predicts to which one of several designated and different categories an individual belongs. Since in many small businesses an employee performs several functions, some of them quite different, there may be here a uniquely useful aid.

A second major area of research is concerned with teaching-learning experiments using subject matter of the off-farm agricultural occupations. The major independent variables may be psychological elements of learning theory or practice. Even though no significant differences are found among treatments, the instructional materials will have been tested and revised. The revision step is not to be forgotten. Available soon from the occupations project at the Center for Vocational and Technical Education, The Ohio State University, will be coordinated teaching modules in agricultural supply, agricultural mechanics, ornamental horticulture and agricultural chemicals. They are ready for research utilization. A pilot program may be planned to yield research results.

A third suggested direction for productive research is in the term "supporting education." There is a new report form of the Office of Education that asks the states for numbers of students in each vocational field who received supporting instruction furnished by another of the fields. Whether to teach distribution methodology, communications skills, or human relations areas as an integral part of a product knowledge course or as separate courses certainly is worth research funds and staff time. The answers need to come from actual school and industry settings. Quite likely they need to be replicated and validated with

widely differing age groups, levels of student ability and of education, and among varying types of businesses.

As a fourth, and in this brief presentation, a last direction in which research effort can profitably be aimed, systematic programs of placement and adult counseling may be named. Post-high school education is definitely occupationally oriented. Colleges accept responsibility for the placement function. So should vocational training programs. Involvement with industry and with the Bureau of Employment Security should be the focus of research projects in all states. Reporting and record-keeping systems deserve research development. Evaluation, as envisioned in the Vocational Education Act of 1963, will be implemented at the same time.

In conclusion, credit certainly has been earned by the leaders who have sponsored the succession of research coordination conferences in the past several years at The Ohio State University. Special appreciation is due the Vocational and Technical Division, Office of Education, for support of the national, regional and state research conferences. All states have freely shared the outcomes of research. Citizen and industry groups along with experts in related professional fields have given full cooperation. They will be invaluable as, with the adequate funding now available, larger numbers of well-trained research workers address themselves to what are chosen as the most promising new directions in research.

PRIORITY AREAS FOR PROGRAM DEVELOPMENT
IN AGRICULTURAL EDUCATION

By H. Neville Hunsicker
Head
Agricultural Education Occupations Branch
U.S. Office of Education

I am sure that all agricultural educato s very much appreciate the outstanding work underway by the staff of the National Center for Vocational and Technical Education. The fact that the idea of a National Center for Research and Leadership Development was initiated and championed by personnel in agricultural education should give us much satisfaction and a sense of pride.

We who are attending this National Research Seminar and our staff associates at home are the leaders in agricultural education in America today. Our role is important. What we say, as well as what we do, will determine the program's future. Let us constantly re-examine our practice which inescapably sets the direction for our program. Let us continuously modernize our practices that our training may be geared to opportunities in agriculture and the training needs of students (of all ages) who intend to be employed in it.

The following are ten high priority areas for program development in agricultural education. The first five are especially critical ones:

1. Telling the Story of the Importance of Agriculture to America
   a. Its influence on our economy
   b. Its role in our defense
   c. The declining surpluses - (50% less than in 1960)
   d. The population prediction by year 2000 (doubled)
   e. Agriculture is vital to America

2. Expanding Vocational Education in Agriculture
   a. Its identity (must be) maintained
      (1) If identity is lost, not much use to discuss program development.
      (2) We cannot expect that those whose allegiance is to some other phase of education or occupations to render the educational services needed in American Agriculture.
   b. Concept of agriculture and of agricultural education must be broadened to include: (1))Production (2) Service (3) Processing (4) Distribution (marketing).
   c. Survival and certainly further growth requires a well informed school administration and lay public.

3. Solving the Problem of Teacher Supply
   a. The shortage of teachers is the most critical in years - (an estimated 1500 new teachers needed in 1966 and nearly 2500 in 1967).
   b. Without teachers we won't need research, in-service training or other aspects of the program.

c. Study the effect of the current research emphasis on teacher supply. Is it increasing or decreasing the supply?
d. Adjustments may be needed in certification.
   (1) More emphasis on specialities such as agricultural mechanics, dairying and ornamental horticulture.
e. Special training and use of emergency teachers may be a necessity.

4. Exerting Dynamic State (and Natl.) Leadership in Agricultural Education

   a. Staff of adequate size
   b. Freedom to operate
   c. Ability to persuade
   d. Vision of future programs
   e. Willingness to plan...and do it
   f. Distribution of responsibilities
   g. Maintenance of cooperative relationships

5. Establishing Post-High School Technician Training Programs
   a. An area for immediate action - appropriate agricultural curriculum must be included in these institutions.
   b. Many general educators want vocational education to move to the post-high school level.
   c. A problem for study: Semester versus quarter system of operation.

6. Expanding Adult Education Programs in Agriculture
   a. This is one of our greatest un-met needs in agricultural education.
   b. Opportunities unlimited in Farm Management, Farm Mechanics and Occupational Specialities.
   c. Actively promote and establish programs under MDTA, Appalachia and with other financing.
   d. Make use of available resources such as ASCS, economic opportunity programs, and trade organization representatives.

7. Extending and Improving the High School Program
   a. In cities as well as in rural schools
   b. In area schools
   c. Provide respectable facilities--not toys or playhouses
   d. Caution able students about early career specialization
   e. Realistic enrollments per teacher, which will permit good vocational education
   f. Continuous work on course content will be needed
   g. Establish pilot programs for disadvantaged youth

8. Using the FFA Effectively
   a. Recognizing its indispensable role in vocational agriculture
   b. Consideration of a post-high school branch
   c. Establishing leadership development centers (camps or conference centers)
   d. Modernizing the FFA Constitution and activities

9. Preparing Instructional Materials and Doing Needed Research
   a. Establish priorities -- avoid undesirable duplication
   b. Emphasis is on applied research
   c. Continue the occupational studies--a national summary is needed

10. Emphasizing High Quality Occupational Experience
   a. Essential for students of all ages in all types of classes
   b. Emphasis on employability of graduates in terms of their training objectives.

Obviously, these areas are only a few of the ones requiring our attention in 1966. Many of them are similar to those of two, five, or even 10 or more years ago. However, as we look at the areas of agricultural education today, the experience may be compared to climbing a circular stairway in an observation tower. The higher we climb, the landscape and direction of our vision may be the same, but the perspective is different--and we can see farther. Let us then arise to the new challenges and opportunities before us in agricultural education and exert the leadership which will be required to make the needed adapations. Also, let us hope we have the right perspective of employment opportunities and of the training needs of students.

STATE LEADERSHIP RESPONSIBILITIES IN PLANNING
AND CONDUCTING PILOT PROGRAMS

by
Marvin G. Linson
Assistant State Director of Vocational Education
Colorado

As I went about the task of preparing my remarks for today, I found it difficult to be very profound for much of what I am going to say has been said before. Furthermore, I was constantly reminded, as I thought of who might be in the audience, that most of you are more knowledgeable on this subject than I am. I consoled myself, however, with the thought that as busy as we all are these days, it is well that we be reminded occasionally of those things we all know are right, but in our speed we sometimes neglect because the right way is not always the easiest or the fastest way of getting things done.

I firmly believe that although time is of the essence in our race to keep vocational education ahead of the needs of the people, we dare not sacrifice quality in our programs for the sake of speed or quantity. I am suggesting, as you can readily guess, that pilot programs can and should be our quality control in vocational education.

Why Do We Need A Systematic, Continuing State Program for Piloting Promising Innovations in Agriculture Education?

It has been said that the one thing we can be certain of is that tomorrow will bring change. If we are to be creators and not followers of change, we need to be organized in such a way that our efforts in creating change will be as routine but perhaps better planned than any of our other day to day tasks.

I say better planned, because we dare not subscribe to or promote change just for the sake of change, and in my humble opinion the directing or creating of change is state leadership's best opportunity to fulfill its leadership function. Only if we organize our efforts in such a manner that a certain percentage of our time is devoted to designing, testing, and disseminating innovations, will we be worthy of the leadership titles we hold.

Anyone in a management position in any of our major industrial concerns today would soon find his company loosing its share of the market if he did not constantly expend large portions of their profits to make obsolete the very product which made the profit in the first place. And, furthermore, that same management person would soon find his job in jeopardy.

I suggest to you that one of the major reasons many other groups are concerning themselves with vocational education is because we have failed primarily at the state department level to provide this kind of leadership.

I realize that as supervisors we have a responsibility for defending and maintaining the kinds of programs we have described in the state plans. I, also, realize it is difficult to destroy that which we have sworn to defend.

Industrial leadership finds it possible, however, to serve the dual kind of role I have described--that of promoting the present product while at the same time they are encouraging their research staffs to find something better. Their motivation is profit. Ours is not, but it may be even more important--our very life. This may sound as though I believe we should promote change in order to preserve our jobs, and that is exactly what I believe--not my job or your job necessarily, but I am egotistical enough to believe that the state boards for vocational education in the various states provide the best structure for fostering, promoting, and administering vocational education. We will succeed in maintaining a leadership role in vocational education only if we earn the right to be called vocational education leaders. In a democracy, leadership should never be vested in anyone or any group for any other reason.

I have said, so far, that we need a systematic, continuing program for piloting promising innovations because it is essential if we are to provide the leadership function given to state departments of education by our Constitution, and I have said no one can do it as well as we can. But there are other reasons every bit as important. Vocational education has a responsibility to those it serves--the student, the employer, and society in general. This responsibility is to provide training which will enable students to enter the labor market as well trained and efficient as possible.

The rapid changes taking place in agriculture and industry make it imperative that we change our programs in order that we might never be justly accused of training unemployables. We need to know what, if any, changes in program will be needed to serve tomorrow's agriculture. We shouldn't guess. We should try out our best ideas in controlled experimental programs, so that we might disseminate widely that which is good and destroy that which proves to be undesirable.

As brilliant as some of our researchers may be, and as capable as some of our educators and educational planners may be, they have made and they will continue to make mistakes. It is the purpose of pilot programs to guard against these mistakes or to keep them to a minimum. General Motors would never consider placing a new design on the market before it had been tested at the proving gound. So, as new ideas are advanced which effect the teaching-learning process, they should be tested in pilot programs to ascertain their value in vocational education programs.

I am sure that all of us at some time or another have deplored the "extremes" of the educational pendulum. I believe the wise, continuing, and systematic use of pilot programs will shorten the arc of the pendulum and hasten the development of educationally sound programs in vocational agriculture.

In my opinion, a third most important reason exists for systematic, continuing state programs for piloting promising innovations. This reason relates to "climate,"--the fear of change and misunderstanding of what we mean when we refer to pilot programs.

I heard an assistant state supervisor in a large state make the statement that there were some new kinds of programs being tried in his region, but he didn't want the head supervisor to know about it until the program succeeded or failed. The implication was that the program would not have been approved for reimbursement. This certainly isn't the kind of climate which would encourage innovation. Perhaps, the real reason that such a climate exists in this state is the fact that no systematic, organized plan exists for conducting pilot programs.

It is normal to resist change, and it is easy to see why people, especially educators, fear change. For as you analyze how we have gone about planning for change, you realize it has been haphazard at its best.

Brickel, in his study of educational change in schools in the state of New York, concluded that "the most formidable block to instructional improvement today is that education unlike medicine, agriculture, and industry fails to distinguish the three phases of change--design, evaluation, and dissemination. Moreover, it fails to support adequately the basic research which should precede the design stage." I subscribe fully to this statement for I know it is true in at least one other state--my own.

State leadership, if it is to make any noticeable contribution to the development of new ideas, must recognize the differences in each of these phases, and, furthermore, they must recognize the part that they can and should play in each phase.

We have discussed some of the "whys" to this point. Before we proceed to the "hows," I think it is best that we define a pilot program. In The Report Of The Second Research Coordinating Conference On Agricultural Occupations, a pilot program was defined as "a planned activity for testing a new idea in a realistic situation."

Since I believe that a pilot program is something more than the testing of a new idea, I am suggesting that for the purpose of unity of thought that you think of a pilot program as a planned activity in the development and adoption of innovation, and further that there are the following four distinct steps in a pilot program.

1. Identifying new ideas and concepts
2. Designing ideas into workable educational programs of action
3. Evaluation through field testing
4. Disseminating ideas which have proven successful

Each of these steps calls for a different set of circumstances, different people, different atmosphere, and different purpose. If each step is to serve its proper purpose, it must be completed before the next step is started, and they must be conducted in the proper order. The responsibility for the proper use of the steps in proper sequence seems to me to be that of state leadership.

I am discussing these steps not because I don't think you are familiar with them, but rather to point out the state leadership responsibility associated with each step. I am sure teacher educators, supervisors, local teachers, and local school administrators feel that given the time and money, they could and should be responsible for each of these steps. But if we are practical, I think we may agree that because of time, money, and the very nature of our organizational structures some of the groups mentioned are better equipped to do the job than others, and some have a greater obligation than others.

In step number one, we identify the ideas which are currently in the minds of people that have implications for educational innovation. Priority should be assigned to those ideas which have particular significance for further development.

The second step involves the process of designing the significant ideas found in step one into a workable plan for action in local schools.

The third step is one of evaluation. Here the plan conceived in step two is tried out where it can be thoroughly tested to determine its educational values. When a new idea has been proven valuable to education, it then is ready for wide dissemination through a fourth step often referred to as demonstration programs.

Each of these four steps are related to each other, but each one is a separate and distinct step that can and should be treated as an individual problem.

Generally speaking, leaders in agricultural education have not recognized the importance of these four steps nor have they recognized that their responsibility varies considerably in each step.

I would like to review briefly with you the unique characteristics of each step, and the procedures which I believe are essential if satisfactory results are to follow.

Step I--Identifying Ideas for Innovations in Agricultural Education

Teachers, state department personnel, teacher educators, and lay citizens all have ideas for improving vocational agriculture programs. Some of these ideas are known only to the person that has the idea, and others have been disseminated widely through the written and spoken word. Some ideas have limited possibilities for application in a statewide program. Some of these ideas are good and some no doubt would prove undesirable. Some ideas have been tried and found successful. Others have been tried and have been abandoned. In many instances the results of either are known only to a few.

Unless the state supervisory staff provides some means of gathering these ideas, many will never be made known. The state staff needs to develop an atmosphere which encourages free communication of these ideas. They, also, need to provide the structure for the handling and processing of these ideas in order that each idea receives consideration for further development.

To implement Step I, the state board through its staff might well establish the following definite procedures.

1. A procedure should be established for continuous evaluation of present programs in the state as a means of identifying needs.

2. Establish a committee to receive ideas, evaluate ideas, and suggest those for which pilot programs should be developed. This committee should also be responsible for determining what changes have recently been made in their own and other states. The National Center, The U. S. Office of Education, and the American Vocational Association Research Committees should provide this kind of information as a continuing service to the states.

3. Periodic requests should be made of those affected by vocational agriculture programs to submit their suggestions for program improvement (advisory committees, teachers, administrators, and teacher educators).

4. Priorities should be assigned to promising ideas.

5. The necessary structure to move ideas from Step I to Step II should be provided.

As I see it, state leadership has a responsibility at this step for creating a permissive atmosphere regarding change. I believe the reason we have been reluctant to create this atmosphere is because we have feared the indiscriminate, haphazard, and uncontolled change that has characterized so many changes in education. I suggest that if this step and the others that are to follow are conducted in an orderly, systematic manner, we will have no reason to fear change.

Step II--Designing the Educational Plan

Everyone in agricultural education at one time or another has thought of something which he felt would improve the program with which he worked. Many of these ideas lie dormant because of a lack of time on the part of the inventor to develop the idea to the point that it could be put into action. Others lie dormant because the inventor lacks the understandings necessary to design a sound program.

This step must be conducted by competent people, given the necessary time and the freedom from normal controls, standards, and regulations.

All rules, except those necessary for the protection of health and saftey of students should be suspended for those who are designing innovation.

State Leadership should provide for the following:

1. A project coordinator who will be assigned major responsibility for coordinating the development of a plan to the point where he believes it can be tried out in one or more schools with a better than average chance of succeeding. Free him from other duties.

2. Specialized consultants who will be given time and freedom to test ideas against known factors and basic research.

3. A critical review of the plan by specialists, staff members, school administrators, and others who are qualified by training and experience to make such an appraisal.

4. A plan that includes the following detail:

   a. Objectives of the innovation

   b. A step by step procedure that will be followed in putting the plan into operation

   c. A list of teaching materials and equipment needed

   d. The kind of enrollment appropriate for the program

   e. A procedure for selecting students

   f. The kind of community and school setting needed for the trial stage

   g. The qualities of teachers and/or others who will be in charge of program and training needed

h. The length of time to complete trial

i. The evaluation instruments that will be used and who will evaluate

j. The number and description of control centers where all factors of evaluation are matched with the evaluation centers to the highest degree possible

k. The time schedule

l. The number of schools needed for experimental centers

m. The approximate (extra) cost of conducting the evaluation step and the source of funds

n. The changes evaluation centers will need to make in their traditional operation

5. Approval of the plan and necessary financing

6. A local project coordinator in each pilot center

Brickel says, "The basic ingredients of a good invention setting are a richness of talent and a freedom to explore. At its best, Step II provides for 1) a group of highly intelligent people, 2) a somewhat limited problem, 3) time to concentrate on a solution, 4) ample money and resources, 5) freedom to try almost anything, 6) the likelihood that the solution will be used somewhere, and 7) the prospect of personal recognition if the problem is solved. The more artificial, enriched and free the setting, the more distinctive the innovation it is likely to produce. Freedom is essential. The atmosphere and the actuality of freedom must be deliberately created."

State leadership has a responsibility here for initiating the structure and organization which can carry out the design step. Few state legislatures would finance this kind of an operation in the state department knowingly and most state staffs are not large enough to free many of their staff at any one time for this kind of an assignment. There are means, however, of providing reimbursement--100% if necessary--to colleges, universities, and local schools for the purpose of getting this job done. It is also possible for the state to contract with private agencies and individuals for certain kinds of consultant services. In addition to the securing of finances, I would think that state leadership has a responsibility for promotion and supervision of these design activities.

Step III--Evaluation or Testing

This step involves taking the completed plan agreed upon in Step II, and putting it into operation in one or more local schools. The plan is field tested under actual working conditions.

It should be realized that a teacher who is introducing a major change, will need varying amounts of assistance. Evaluation of the innovation should be constant. Immediate evaluation may be found in student reaction. Other subjective and objective means of evaluating progress should also be used extensively.

The special attention the teacher receives during innovation may cause him to overproduce to the extent that the apparent beneficial effects of a given innovation will be due to the added effort on his part rather than from the innovation itself. To insure a more accurate evaluation, it may be necessary to give the teachers of control groups the same kind of special attention.

There are undoubtedly other means of guarding against the "Hawthorne" effect. Persons who are knowledgeable in this area of research should be utilized in designing proper methods of evaluating the innovation while it is being tried under actual field conditions.

Every effort should be made to conduct experimental programs under carefully controlled conditions which permit little deviation from the designed plan. Adequate financing to insure proper teaching materials, facilities, and teacher time for preparation is essential. Since evaluation programs are untried and may deviate considerably from standard procedure, it seems wise not to involve more schools than are necessary for proper evaluation. A limited number of schools, never more than those which can be properly supervised, should be selected at any one time.

State leadership should provide for the following:

1. Adequate evaluation and/or control schools

2. The cooperation of the superintendents and others who will be involved

3. Personnel and materials needed in the evaluation and control centers

4. Financial aid that might be supplied from the state department

5. Appropriate contracts between the schools and the state department which clearly states the responsibilities of the local school which will enable it to receive reimbursement

6. Provision for training the personnel who are to work the project

7. Provision for describing innovation in professional publications

Since field testing is often done for the purpose of comparing one method or one program with another for the purpose of advocating change, it seems locical that state leadership should control this step if possible or at least observe it closely if control is not possible.

Those who have made a study of educational innovation tell us that this step has traditionally been skipped. Too often pilot programs have moved from the design stage to the demonstration stage. We not only have the opportunity to stop this trend: we have the responsibility for reversing it.

Some success factors in this stage might include:

1. Avoid overloading teachers

2. Changes in plans must be avoided after experiment starts to assure reliable evaluation

3. Evaluation procedure should be rigidly followed

4. Visitors who are not directly responsible for the operation of project should be discouraged

5. Reports of progress should be made only to school and state board officials and should not be published until the evaluation is completed

6. Recognize if a program isn't working and stop. (But appreciate the benefits derived from knowing that it won't work and share this knowledge as completely as if it had succeeded)

Step IV--Demonstrating Field Tested Innovations

The adoption of new ideas is at best a slow process. People seldom try a new practice until they have had an opportunity to observe someone else do it. There are exceptions to this rule, of course, but people who have studied the process of dissemination of new ideas indicate that written or oral reports of innovations bring about adoption at a much slower rate than does observation.

It is also true that people generally are slow to accept new practices unless they are observed in situations similar to their own. The smaller farmer is inclined to believe that new practices on large farms may not be applicable on his farm. School administrators in a small district may follow the same reasoning in rejecting a new practice which is successful in a larger or wealthier district.

The demonstration of new practices takes place only after evaluation has shown, during the evaluation stage, that the practice is educationally sound. Consequently, the purpose of a demonstration in a pilot center is to disseminate the idea or practice as rapidly as possible in as many centers as possible. During the demonstration process, it may be advisable to avoid artificial, enriched, abnormal, or unrealistic settings or conditions. It may also be profitable to reward the demonstration center with recognition and attention.

State Leadership Should Provide for the Following:

1. A written description of the innovation including details necessary for the implementation of the idea or practice

2. A variety of schools to serve as demonstration centers

3. Arrangements for superintendents and other school people to visit successful programs in the original evaluation phase

4. Training for teachers and others, necessary to enable them them to conduct the new plan or procedure

5. The necessary equipment and qualified people

6. The selection of many but varied centers where the innovations may be conducted under normal conditions

7. An evaluation procedure to compare with results obtained during evaluation phase

8. Revision of the state plan to allow for normal financial assistance for programs proven successful in evaluation stage

9. Arrange for as many teachers and administrators as possible to observe demonstration centers

10. Wide publicity, by oral and written word, to explain the accomplishments of the demonstration schools and the value of the innovation to education

11. Arrange for key people to observe the demonstration. Special attention should be given to leaders in the profession and to people who are known to adopt change readily, as well as, leaders of various social cliques

12. Workshops for other teachers in the state to teach the procedures needed in handling the new practices

13. Revision of the pre-service training program

At this stage, state leadership has a major responsibility for "spreading the word" and training teachers. We have a responsibility for telling others about the bad, as well as the good, and we have a responsibility for training beginning, as well as established teachers so that they might carry on the types of programs which have proven to be worthwhile.

In discussing the specific steps in pilot programs and the procedures to be followed in implementing each step, we have suggested many activities for state staff personnel both at the supervisory and teacher education levels.

There are several points I made or alluded to that need to be re-emphasized, however, as they apply to the administration of pilot programs in any given state.

The first one concerns the number of pilot programs which should be under way at any one time. I believe that there should never be any more pilot programs under way (at the evaluation or testing stage) than there are field personnel on the supervisory and teacher education staff. If there are two supervisors and one teacher educator in a state who normally visit local schools for a large portion of their time, then there should not be more than three experimental programs in process. In smaller states where there might only be one supervisor and one teacher educator, I would think that more than one experimental program at any one time would be too many.

When programs have been proven and are at the dissemination stage, I would not be as concerned about the numbers, provided each demonstration center could be visited at least three or four times a year.

Another point that I believe can be defended is that at least one full time person be assigned the responsibility for coordinating, and promoting action research activities at the state level. This person to be in addition to the teacher education personnel who are assigned research duties.

Third, I believe every state plan and/or policy manual should not only provide for research activities of all kinds, but should spell out in some detail the procedures for identifying, designing, evaluating, and demonstrating pilot programs in order that every person engaged in vocational education will be aware of their responsibility for improving the state-wide program through innovation.

If this procedure works for agriculture, medicine, and industry, it is time we bring the same orderly, systematic approach to action research in education.

Fourth, the responsibility for financing pilot programs is primarily that of the state--especially in Steps I, II, and III. The Vocational Education Act of 1963 provided funds for this purpose. I hope that we will make every effort to use it wisely.

Since our purpose in promoting pilot programs is to focus attention on problems of importance to the state-wide program, it is unreasonable to expect that a single school district can be expected to bear more than a minor portion of the expense. The cost of carrying on a pilot program, properly done, is much greater than the traditional on-going program and since it benefits the entire state, it should be the responsibility of the entire state. A local school superintendent often finds it impossible to perform Step III without defending the expenditures through volumes of publicity. This defeats the purpose of the testing stage.

If state funds are supporting the project, less objection may be found locally and interference can be controlled by those who are concerned primarily with the findings of the study rather than the cost per pupil. The local project director and/or teachers may be freed of outside duties without objection from other staff members who may be carrying heavier teaching loads.

Fifth, great care needs to be taken to assure that there be clear-cut distinction between the testing stage and the demonstration or dissemination stage.

In closing let me review with you some key words that clearly describe the characteristics of the four steps in piloting an innovation.

<u>Step I--Identification</u>

Permissiveness,
Persuasion, Coordination

<u>Step II--Design</u>

Intelligent People, Ample Resources,
Ample Time, Freedom From Any Other Assignment,
Limited Problem, Availability of Consultants

<u>Step III--Testing (Evaluation)</u>

Controlled, Closely Observed,
Restricted, Enriched, Diverse Settings

Step IV--Dissemination

Unenriched, Normal But Diverse Settings, Carefully Trained Teachers, In-Service Training

I am sure that some of you will disagree with some of the things that I have said, but I am hopeful that we can all agree that vocational education can benefit from the increased use of properly conducted pilot programs, and further that it is the responsibility of state leadership to initiate a major trend in this direction immediately.

NEBRASKA'S PLAN FOR PILOT PROGRAMS

by
Glen H. Strain
State Director of Agricultural Education
Nebraska

Past History of Research in Agricultural Education in Nebraska

For many years this area in Nebraska was very limited. This was primarily due to the lack of adequate staffing and inadequate funding. One man was employed on the Teacher Education Staff. His salary was partially reimbursed with State funds. This man, however, due to a multiplicity of responsibilities, was able to spend less than 50% of his time in this area.

In the fall of 1959 this staff member, along with one member of the Supervisory Staff and one instructor, was selected to discuss the needs, values and purposes for research, an effective way to get research planned, conducted and utilized, and the needs for an organizational structure. An interim advisory committee, composed of a representative from each of the eight-instructor districts in the State, was set up to work with the three man committee. This was in the year of 1960.

In the spring of 1963 a "Nebraska Advisory Council for Research in Agricultural Education" was set up. Dr. James Horner, on the Teacher Education Staff, was selected as coordinator. Personnel on the council includes sixteen active members and seven ex-officio members.

A. Active members include the following:

1. Four teachers of agriculture
2. Four county agents
3. One farmer
4. One off-farm agriculturist
5. One on-farm, non-farming agriculturist
6. One farmer organization representative
7. One school administrator
8. One Vocational Division representative, Agricultural Education Department, University of Nebraska
9. One State Department of Education representative
10. One State Extension Staff member

B. Ex-officio members include:

1. The Director of the Agricultural Experiment Station
2. State Director of Agriculture
3. Director of Agricultural Education, State Department of Education
4. Commissioner of Education
5. Chairman of the Agricultural Education Department, University of Nebraska

6. Director of the Cooperative Extension Service
7. Director of Resident Instruction

Although this council has been in operation a relatively short time, it does show considerable promise of helping move forward research in agricultural education.

With the passage of the 1963 Vocational Education Act and the possibility of special funds for research, an evaluation was made. In the spring of 1964, Dr. Howard Deems, Chairman of the University Agricultural Education Department, called a meeting of the Assistant Commissioner of Education in charge of Vocational Education, and the State Director of Agricultural Education. It was mutually agreed that another person for research should be hired as a member of the Teacher Education Staff, with the State again reimbursing part of his salary. Dr. John Coster, from Purdue, and a member of the Indiana Staff, was the man we chose. Fortunately for Nebraska, Dr. Coster was interested and became a member of our Staff on July 1, 1964.

Development of Nebraska's Plan for Pilot Programs

The Central Region Research Conference in August, 1964, at Columbia, Missouri, provided the challenge and impetus needed for our staffs to start the ball rolling.

A meeting was called for the staff members present at the conference. It was agreed that one thing about which we knew very little was the new area of off-farm agricultural occupations. Questions such as the following were asked:

A. Is any instruction in Vocational Agriculture essential to initiate entry into agricultural occupations other than farming?

B. Won't our present Vocational Agriculture program take care of this?

C. How much on-the-job experience should students in this area have?

D. Should a general related class be given to these students as well as on-the-job experience?

As the discussion proceeded, it was quite obvious we needed something to help answer some of these questions. A pilot program was suggested. Dr. Coster said he had given this some thought and presented those in attendance an idea of what he had in mind. Everyone agreed that Dr. Coster and Dr. Horner should proceed.

Several staff meetings were held which again included the Assistant Commissioner of Education in charge of Vocational Education. The purpose was to keep all informed of the process and progress.

Birth of Nebraska Project No. 1

Project Title: "An Experimental Evaluation of Approaches to Preparing High School Students for Agricultural Occupations Other Than Farming." This was submitted to the U. S. Commissioner of Education under the Provisions of Section 4(c) of the Vocational Education Act of 1963.
Applicant: University of Nebraska
Initiated By: John K. Coster, Professor and Director of Research, and Howard W. Deems, Professor and Chairman, Department of Agricultural Education, College of Agriculture and Home Economics, University of Nebraska, Lincoln, Nebraska.

Principal Investigators: John K. Coster
James T. Horner
Duane E. Loewenstein
Douglas D. Sjogren
Glen H. Strain

Submitted By: H. H. Kramer, Director, Agricultural Experiment Station, College of Agriculture and Home Economics, University of Nebraska, Lincoln, Nebraska.

Federal Funds Requested: $12,780 for fiscal 1965
$38,000 for fiscal 1966
$290,000 for eight years

Duration: Beginning 1 January, 1965
Ending December, 1972

Date Transmitted: 5 November, 1964

The Problem

The central problem of this study is to evaluate the effects of selected treatment and classification factors and indicated interactions on the preparation of high school students for initial entry into agricultural occupations other than farming, as measured by dependent variables. The central problem is elaborated into the following parts:

A. To compare three "Pilot" programs for preparing high school students for initial entry into agricultural occupations other than farming with a "Control" group, with all four groups to be incorporated into an experimental design, with an internal source of experimental error.

B. To determine the optimum number of years of instruction in Vocational Agriculture appropriate for high school students who desire to prepare for initial entry into agricultural occupations other than farming.

C. To examine the relative effectiveness of two patterns of curriculum organization in Vocational Agriculture courses.

D. To investigate the effects of classification factors pertaining to high school students on the dependent variables, and to study the interactions of classification factors by treatment factors.

The Objectives of the Study

The principal objective of the study is to obtain answers to the three questions posed by the theoretical construct of the study:

A. Is instruction in Vocational Agriculture essential to initial entry into agricultural occupations other than farming?

B. Is a practical, on-the-job, institution directed work experience program essential to initial entry into agricultural occupations other than farming?

C. Is a course in Related Instruction essential to initial entry into agricultural occupations other than farming?

Memorandum of Agreement

To bring out more information on the project, I am hereby including a Memorandum of Agreement which was sent to all schools who had indicated an interest and then were drawn at random to participate.

Department of Agricultural Education
Agricultural Experiment Station
College of Agriculture and Home Economics
University of Nebraska
Lincoln, Nebraska

MEMORANDUM OF AGREEMENT

This Memorandum of Agreement is entered into between the

(local school)

which hereinafter shall be designated as the Party of the First Part; and the Department of Agricultural Education, Agricultural Experiment Station, College of Agriculture and Home Economics, University of Nebraska, Lincoln, Nebraska, which hereinafter shall be designated as the Party of the Second Part.

THE PARTY OF THE SECOND PART hereby agrees to provide to the Party of the First Part the following services, materials and reimbursements:

1. To provide not less than thirty (30) days of training to the Vocational Agriculture teacher designated by the Party of the First Part, during the summer of 1965, with twenty days to start on or about 14 June 1965 and end on or about July 1965, and with an additional ten days of training to be arranged with the cooperating teachers, to be offered subsequent to 9 July 1965, said training to be offered by the Department of Agricultural Education, College of Agriculture and Home Economics, University of Nebraska, Lincoln, Nebraska.

2. To provide reimbursement to teachers for subsistence while in training and while attending workshops called by the Project Directors at a rate not to exceed $8.75 per day, and to provide reimbursement for travel from the school city to Lincoln, Nebraska for not more than six round trips while in training in the summer of 1965, and for travel for workshops at a standard rate of seven (7) cents per mile. (It is stipulated that teachers may receive graduate credit for training, provided that the teacher pays the cost of tuition at the standard rate of $11.00 per semester hour. Teachers may register for six hours of credit during the summer of 1965, and for two additional semester hours at their convenience as a problems course, for a possible total of eight semester hours of credit.)

35 ✓ 105

(Memorandum of Agreement Continued)

3. To provide instructional materials for the Related Instruction Course and for the Directed On-the-Job Work Experience Course.

4. To provide the necessary standardized tests and instruments constructed as part of the project for the conduct of the measurements and evaluation phases of the program and to provide results of tests to the school.

5. To provide in-service instruction and assistance for the operation of the project, regardless of the instructional program assigned randomly to the school.

6. To direct and supervise the follow-up phase of the study and to provide results to the school.

7. To reimburse the teacher for professional services rendered to the project, specifically for keeping records and conducting follow-up studies at an honorarium rate of $5.00 per hour, and to reimburse the teacher for subsistence and travel incurred in fulfillment of the project.

8. To provide a copy of all progress reports and the final report to the school.

9. To continue the research and instructional program for three complete school years, and to continue the total program, including follow-up, for four years, until 30 June 1969, providing that the contract between the Office of Education, U. S. Department of Health, Education and Welfare and the Board of Regents of the University of Nebraska continues until completion of the proposal submitted by the Agricultural Experiment Station of the University of Nebraska, and approved by the U. S. Commissioner of Education remains in force. A copy of the proposal and amendment is attached to the original copy of the Memorandum.

THE PARTY OF THE FIRST PART hereby agrees:

1. That the teacher of Vocational Agriculture designated by the Party of the First Part will pursue the thirty day training program during the summer of 1965 as outlined by the Project Directors.

2. To accept and put into force any one of the following four treatments which is to be assigned randomly to the school at the termination of the first twenty days of training, the assignment to be made on or about 9 July 1965:

(Memorandum of Agreement Continued)

I. Instruction in Vocational Agriculture only (six schools).

II. Instruction in Vocational Agriculture plus the Related Instruction Course to be offered to Seniors. The Related Instruction Course is to consist of approximately 90 hours of General Related Instruction, and approximately 90 hours of Special Related Instruction (six schools).

III. Instruction in Vocational Agriculture plus one year of Directed On-the-Job Work Experience in an agricultural occupation at a station to be designated by the School, to be offered during the Senior year (six schools).

IV. Instruction in Vocational Agriculture plus the Related Instruction Course plus the Directed On-the-Job Work Experience Program to be offered during the Senior year.

3. To follow one of the two plans of curriculum emphasis as follows:

A. All new Vocational Agriculture programs, and eight existing vocational programs selected randomly will organize curriculum content around biological, chemical, physical, economic, and mechanical principles underlying agriculture. (Instruction in principles will be offered to all teachers during the summer of 1965.)

B. Eight existing schools, selected randomly, will organize curricula content around the problems of agricultural workers.

4. To participate in the measurement and evaluation program.

5. That the teacher shall participate in the follow-up studies of program graduates.

6. To continue the instructional program for three school years (1965 to 1968) and the follow-up program until 1969.

It is understood that the plan of reimbursement for instructional costs and for equipment will be entered as a matter of contract and/or agreement between the school corporation and the State Board for Vocational Education.

In witness thereto, the representatives of the Party of the First Part and the Party of the Second Part have accepted the provision of this Memorandum of Agreement, and have thereupon indicated acceptance by their signatures:

FOR THE PARTY OF THE FIRST PART:

Date

(President) (Secretary) Board of Education

Date

Superintendent of Schools

Date

Principal of High School

FOR THE PARTY OF THE SECOND PART:

Date

Director, Agricultural Experiment Station College of Agriculture and Home Economics, University of Nebraska

Date

Chairman, Department of Agricultural Education, University of Nebraska

Date

Project Director

APPROVED Date

Director of Agricultural Education
State Board for Vocational Education
State of Nebraska

Reimbursement

To help induce the needed eight new departments in the pilot, the State Board of Vocational Education has agreed to the following reimbursement for three years:

A. 50% of instructor's vocational salary.

B. 50% of local travel for supervision.

C. 50% for equipment.

D. 50% for textbooks, reference books, and agricultural bulletins.

E. 50% for maintenance and repair of all equipment costing $100 or more in which the U. S. Government has 50% interest.

In contacting these schools, Dr. Coster and one member of the Supervisory Staff cooperatively worked together as a very effective team in making personal visits.

Factors for Success

In analyzing the success to date in this project, it would appear some of the following have been important contributing factors:

A. Cooperation

Much credit has to be given to Dr. Coster for the excellent manner in which he has involved both the teacher training staff, the State Supervisory Staff, and the Assistant Commissioner of Education in charge of Vocational Education. At every step, he has kept everyone mentioned above completely informed, even though the project is being funded through 4(c) funds. In so doing, all of us have been enthusiastic and have talked the project at every opportunity. This enthusiasm has carried over to the schools and instructors. Perhaps partially as a result of this, many more schools applied for participation than the project was set up to handle.

B. One man, Dr. Coster, was given the major responsibility to proceed, and with it the understanding of having time to do the job and the assured cooperation of schools, instructors and the State Staffs.

C. Everyone assisted in helping out where possible, but again, without question, the success of the project primarily has been due to the capability of Dr. Coster and the leadership which he has exerted.

Project No. 2 Approved

One of the most pertinent and pressing problems confronting the State Board for Vocational Education in Nebraska is that of collecting, analyzing, synthesizing, interpreting, and translating into programs of Vocational and Technical Education and occupational preparation of less than college grade, the necessary data and information, from which plans may be made and programs developed at state and local levels, for developing programs of Vocational and Technical Education in the schools of Nebraska. Requests for assistance from local schools in program planning and curriculum development, with emphasis on translating occupational trends, projected needs for initial entry into the labor force, and the projected composition of the labor force into programs of Vocational and Technical Education and occupational preparation, are accelerating at a rapid pace.

Further, seminars and meetings of school administrators held during the past year in Nebraska to discuss Vocational and Technical Education in general, and the provisions and potentialities of the Vocational Education Act of 1963 in particular, have generated and evidenced widespread interest in developing and expanding programs of Vocational and Technical Education in the public schools of Nebraska. A breakthrough to provide more adequate programs of Vocational and Technical Education among the schools of Nebraska, especially in the rural areas, is imminent. It is imperative that the generated interest in and concern for these programs be accompanied--or, better still, preceded--by a program of research coordination, information processing, and interpretation, which will impact upon and relate to decision-making processes by which programs of Vocational and Technical Education and occupational preparation are developed at the State and local levels.

Faced with the above problem a project entitled, "The Establishment and Development of a Research and Coordination Unit in the Area of Occupational Needs, Research and Coordination in Nebraska," is under way.

Fortunately, it was possible to acquire a young man with former experience in school administration and the Manpower Training Program, and who has recently completed his doctor's dissertation entitled, "A Program to Determine Educational Needs in the Field of Vocational Education in Local School Districts," to be coordinator of this project.

The project is again being funded under 4(c) at a cost of $99,830.

In Conclusion:

We do feel pilot programs are necessary for testing a new idea in a realistic field situation.

We do anticipate developing pilot programs in program areas other than off-farm agricultural occupations where the problem and need is recognized. At the present time, we do have a much less sophisticated pilot program in progress entitled, "Establishing Local Young Farmer Opportunity Committees."

We do envision pilot programs as a continuing part of a State program, and not necessarily an occasional activity.

Most of our present pilot programs are now funded under 4(c), but the less comprehensive and less sophisticated ones have been funded under regular Vocational funds or by Ak-sar-ben, which is an Agriculture Society in Omaha.

We have experienced considerable beneficial side effects, I believe in all cases, when pilot programs have been launched...side effects such as outside interest in the program, revived interest and enthusiasm within the program and considerable educational growth in carrying out the projects.

Finally, and possibly the most important area again is the employment of well educated research personnel who have interest in operative research as well as basic research, and who have a free hand to proceed with assured cooperation and the possibility of sufficient funds.

EVALUATION OF PILOT PROGRAMS

by
G. L. O'Kelley, Jr.
Professor of Agricultural Education
University of Georgia

During the past few years the number of so-called pilot programs in the field of vocational education has been increasing by leaps and bounds. One does not have to qualify as a seer to predict a continuation--in fact, even rapid acceleration of this trend during the next few years. The cause for the apparent popularity of such programs may be attributed to two factors. They are:

1. In order to keep pace with a constantly changing technology, vocational education program planners have increasingly been forced to project new ways (or programs) of meeting emerging demands. The desirability, wherever possible, of trying out these program innovations via pilot installations rather than in area-wide adoptions is obvious and requires no justification. On the contrary, educators who conduct them deserve our commendation for their professional concern and integrity.

2. The provisions of the 1963 Vocational Education Act places even greater emphasis than ever before on pilot-type programs. In addition, it makes financial support available at the state level by removing certain budgetary restrictions and at the national level through the medium of direct grants. Inevitably the prospect of federal grants always excites the interest of school administrators, and I predict a rash of pilot programs to break out in the field of vocational education in the coming months.

Pilot programs undoubtedly have a role to play in our scheme of things and the findings of such programs, if properly authenticated and presented in readable form, have a contribution to make to our professional storehouse of knowledge. Pilot programs serve a useful function in the field of vocational education at both local and national levels. The value locally of a pilot program is immediately one of utility--it brings to bear via the elements of action research a collective intelligence on the solution of an existing problem. Far outweighing this return, however, is the contribution which may be made to the state, region or national levels if it is possible to generalize from the pilot situation to a much broader theater of operation. One good pilot program could make it possible to avoid scores of failures elsewhere or result in scores of people saving a year or more of valuable time duplicating the same procedure to learn the same thing.

Whether such generalizations are possible rests entirely with those who decide how the pilot program shall be conducted and evaluated and how the findings of same shall be reported.

Pilot programs improperly conducted and carelessly or erroneously reported can do irreparable harm to the profession as well as to the public. Just because a particular program is outstandingly successful in one situation is no guarantee it will, or will not, succeed in another situation (or even in the same situation if repeated) if the original success was due to the brilliance and persistance of a great teacher and not to any peculiar features of the program itself. Such a teacher might well have come up with equally outstanding results using a totally different approach. The teacher and not the procedure made the reported difference, but if the project report failed to bring this variable into focus, you and I could be sadly disappointed in our own attempts to obtain equally satisfactory results with a similar procedure.

Pilot programs which are less than spectacularly successful in terms of the intended outcome may yet be of inestimable service to the profession if the project is properly evaluated and reported. When the conditions under which the program was operated are carefully reported and the degree of success or failure reported by specific areas in understandable terms, a careful reader may quickly identify promising alternatives and thereby avoid unnecessary mistakes in his own project. For instance, a report may show that students failed to reach the established objective during the instructional period, but that they nevertheless made continuous progress from beginning to end. A thoughtful reader will begin immediately to ponder the merits of a longer instructional period in his own project.

This leads us to the inevitable question--what constitutes a true pilot program? Most of us have our own answer to this, but even so, I wish to comment on my own point of view, as any further observations which I shall make will be predicated upon this point of departure. Actually, it may be simpler to spell out what is not a component of a worthwhile pilot program and then examine what remains.

No matter how helpful such a designation may have for a particular situation just to so entitle any innovation which a teacher or administrator may consider feasible in order to circumvent some existing policy or standard does not make that effort into a pilot program. This type of practice remains an expedient move no matter what it is called, and even though justifiable to those immediately concerned, it should be accepted at its face value and, in most instances, promptly forgotten for purposes of program improvement.

Neither is an elaborate experiment in which the performance of X group compared with the performance of Y group with certain treatment carefully administered and certain variables rigidly controlled to be considered as a pilot program. This is a research project and it undoubtedly, if properly designed and conducted, will contribute much

to the cause of education. It may even lay the groundwork for a subsequent pilot program, but within itself it is not a pilot program. It is an experimental research project.

Then what is a pilot program? A true pilot program is a procedure which is carefully and painstakingly projected in keeping with solid research findings or else predicated on thorough philosophical reflection. Through either channel a new, and hopefully, better way of conducting a program is projected for trial under realistic conditions. Educators who are convinced the innovation is superior--either overall or in some of its features--but being unwilling to commit an entire system to the resulting change without first ruling out every obvious chance of failure will resort to a carefully conducted and observed pilot program to validate the proposal. A pilot program then supplies the equivalent of the "tested through action" step of the reflective thought process. Theoretically, all evidence available supports the proposal, but until the empirical evidence is in hand the proposal lacks that final endorsement. Armed with the empirical evidence the educator is willing to generalize to greater and more costly ventures.

The purpose of a true pilot program, then, is to validate under normal conditions a proposed program innovation. To the extent the conditions surrounding the pilot are normal and the evaluation complete and comprehensive other educators will feel free to construct programs along similar lines when they have studied and interpreted the reported findings.

Why evaluate a pilot program? In the light of the previous discussion, the need for stringent evaluation of any pilot program is twofold: (1) to determine the merits of the procedure in terms of the local situation together with implication for same, and (2) to provide a basis whereby other educators may profit from the same tryout without duplicating the costly expenditure of money and time. The ultimate purpose of all action research is program improvement and, of course, this is equally true of all evaluative effort. If we had time, I think we would be forced to conclude that evaluation and action research are very, very closely related. We in agricultural education have still another restraint affecting us as we discuss the need for evaluating pilot programs. We are operating under an injunction of the AVA that no funds be approved for pilot programs without prior approval of plans for the careful evaluation of the program and its outcomes. There seems to be no basis for doubting the intent of U. S. O. E. to lend their support to such restraint.

Evaluation, then, should and apparently will have serious meaning to all of us who are interested in pilot programs during the next few years. Educators seem to enjoy discussions involving semantics, and, as a result, educational terminology has different shades of meaning for different individuals and even for entire groups. In my own institution we "evaluate" student applications, student progress, programs in the department, college or university. We even "evaluate" facilities, books, ideas, ourselves and unfortunately our associates.

Webster defines to evaluate as "to set down or express the mathematical value of; to express numerically" or "to examine and judge concerning the worth, quality, significance, amount, degree or condition of." Obviously the terms mathematical value, numerical expression, amount, degree, etc., imply some degree of exactness or at least understandable terms of measurement.

Educators assign various shades of meaning to the term ranging from an exact value to a vague summation. In 1950 Harold Shane reported a study involving 200 educators which revealed no less than five clear-cut concepts with regard to the meaning of the term evaluation. They are listed as:

1. Application of a value to a problem (textbook ratings)
2. Synonym of measurement (test scores)
3. Label for a process (rating teacher competency)
4. Appraisal of curricular practices and resources
5. Study of change--(pupil behavior)

Apparently these range along a scale or are continuous all the way from casual opinion to scientific measurement. The "application of values" concept appears to characterize the more elementary approaches while the "study of change" concept has many of the elements of meaning associated with the more sophisticated approaches to evaluation as we know it.

Tyler defines evaluation as "a process by which the values of an enterprise are ascertained." Certainly I cannot afford to disagree with such an authority, but for purposes of discussion I question whether "values are ascertained" or just "agreed upon," if ascertain means "to find out with certainty" as Webster defines it. My old friend and teacher, J. E. Greene, defines it as "process of securing value judgments concerning a condition or process." I like the identification of the action word "process" and especially the terminology "securing value judgments." I also used to like to hear him emphasize his belief that value judgments were based on a consideration of the best "evidences" available--whatever they might be. Some may be scientifically exact and some rather inexact but expressive.

It appears that in many efforts which are labeled as evaluation there seems to be considerable difficulty encountered in arriving at a systematic measurement of the characteristic studied. Many times a respected and experienced judge can assign a value which for all practical purposes has meaning and usefulness in affecting judgment. After all, improvement of the condition is the ultimate goal of all evaluation. For this and other reasons I like the definition, "the process of securing value judgments concerning a condition or process" even though I can claim no authorship rights. I do insist that such

judgments are based on the best evidences, and this evidence may vary from an opinion to exact scientific measures. Evaluation when considered as a process and not as a fixed point or value permits one to concentrate on procedure rather than becoming bogged down in the minutia of specific measurement. Vocational education leaders have always been too concerned with action to become concerned with laboratory detail--at times regretfully so. So I offer no apology for my wish now to discuss evaluation in terms of procedure.

Many, many so-called principles of evaluation have been advanced and debated over the years. Many have merit, but I shall not belabor you with the merits of more than the three which to me seem germane to this discussion. These are:

1. Effective evaluations are continuous and not of a specific moment only.

2. Effective evaluations are made in terms of specific goals or objectives.

3. Effective (complete) evaluations must involve the actual participation of the person(s) or organization(s) concerned in the process.

I should like to discuss these three briefly as I see them affecting our pilot program discussion.

Effective evaluations are continuous.

This is just another way of saying the evaluation process is concerned with measuring or making judgments regarding the change which has occurred from one point in time to another and not in identifying a static point. To know that at a given moment a youngster's weight is 122 pounds and his vision 20/40 is highly interesting, useful and usable information. We need more such exact measurement; but unless these measures can be associated with some process on condition they will remain just that--measures to serve as a basis for comparison with some norm, etc. Now, to know that six months ago before a diet and corrective lenses were prescribed, the youth weighed 98 pounds and his vision was 20/200 is to be in position to place a value judgment on the treatment he has undergone. To know that in 1960 the mean verbal CEEB score for an institution's entering freshman class was 425 while in 1965 it was 465 is to be in position to place a value judgment on the admissions program of that institution. Whether the change was the result of changes in the admissions program or in high school study programs or because of some other factor, is a suitable topic for careful research. But the process of determining that the change did occur is illustrative of the evaluative process while to determine course relationships is a research function.

If we hope to make worthwhile results available regarding pilot programs, we are going to have to establish bench marks at the beginning of the program against which to measure changes occurring during

operation of the program. With a beginning point and a terminal point established and sometimes with interval measures along the way, we can make judgments regarding the effectiveness of the program. Furthermore, if I use some sort of standardized measures, or at least clearly understood terms and procedures in my program and the report I write up on it, you can evaluate the same program in terms of your own situation. But if I tell you the average score on a certain aptitude test of a group of students' competency in my pilot program in welding instruction is 98 and fail to tell you that the average initial score at the beginning of the instructional period was 97, I probably have succeeded in completely misleading you regarding the effectiveness of the instruction. Knowing the initial and terminal scores and other factors being equal, you will merely dismiss the matter from further consideration.

My only reason for this emphasis of such a simple point stems from the number of requests I have heard from others for assistance in the evaluation of a program that is in its final stages of completion or worse--already completed. Plans for evaluation of a pilot program should begin when the program is being proposed and not when it is already under way and certainly not after it has been completed. Unfortunately, the preoccupation of vocational agriculture leaders with action quite often causes them to overlook the need for much spade-work with pilot programs long before the kickoff time.

Effective evaluation must be made in terms of specific goals or objectives.

It is always interesting to learn of serendipitous outcomes of any educational program, but if the outcome is entirely outside the projected area of service of the planned program, one who is interested only in the anticipated outcome does not assign a high judgment value to the program being evaluated on the basis of that particular measure. In other words, if a school spends thousands of dollars establishing a program to train typists, then responsible teachers want to know how well the graduates perform as typists. The fact the graduates are better telegraph operators than those lacking such experience is interesting information but sheds no light on the merits of the program in terms of its stated objective--to train typists.

This principle also is simple in terms of its face value. In reality, however, educators in general and vocational educators in particular, are often accused of extreme laxity when it comes to projecting clearly defined and realistically attainable goals or objectives. We like to deal in vague ambiguities such as training for "leadership" or "cultural appreciation," etc. Stating clearly that the program proposes to prepare students who can type 55 words a minute with no "strike-overs" sounds mercenary to some. But to the everlasting credit of the plodders among us who view educational objectives in such concrete terms, we must admit it is relatively simple for such educators to determine when they have accomplished what they set out to do. Even though they agree with their more vocal colleagues regarding the virtues of "love of God, mother and country," they are able to conceptualize the job before them in terms of specific goals to be sought and achieved. Like the

true politician they hopefully visualize an ideal, but they realistically seek the attainable.

In these pilot programs even before plans take preliminary shape we must agree upon the specific goals we seek, and if humanly possible, spell them out in terms which are subject to some type of measurement.

One side observation, at this point, could be that we in vocational education could well afford to solicit the counsel and assistance of our colleagues from other disciplines in establishing objectives for our pilot programs. Although we will probably insist on retaining a position of prominence for the attainment of competencies which have labor market value, they might lead us to see other reasonably attainable goals which would make our students even more productive and adaptable individuals in a complex society. Unquestionably some of our friends in the fields of tests and measurement or in programmed instruction could help us sharpen our own objectives in terms of suitability for measurement, etc., for evaluative purposes. If we persist in projecting vague generalities in lieu of clearly defined objectives, no one will be able to evaluate progress made toward their attainment. Unfortunately the old vocational agriculture objective of training farmers and prospective farmers for proficiency in farming came back to haunt many teachers who really were trying to train for non-farm agricultural occupations.

<u>Complete evaluation must involve the actual participation of the person or institution concerned in the process</u>.

Not all of us take kindly to this idea, either conscientiously or otherwise. Of course a completely disinterested third party can make value judgments regarding the attainment of some goals, but, on the other hand, if the student or teacher involved wishes to prejudice the observer's judgment one way or the other, he will usually be able to do so.

More important than this is the importance of those desirable changes which occur "inside" the student and which may not be readily discernable or objectively measurable. Such things as confidence in one's ability to perform at the level at which he has been taught, pride of accomplishment, feelings of resentment, regret or antagonism are important outcomes but evidence regarding them are not subject to quick and ready measurement. Evaluation is not a process of obscuring or glossing over outcomes but of collecting, identifying and measuring all sorts of evidence which will depict the attainment or lack of attainment of an objective.

Extreme caution should be exercised in collecting subjective evidences of progress from persons who are themselves involved in a pilot program, but such evidences are indeed important. After all, much useful evidence is inexact, but if it helps to fill out a true picture, it is needed. In the final analysis, the person who analyzes the evidence and makes the final interpretation of the worth of the pilot program

must assign relative weights or values to the various piece of evidence. It should be unnecessary to point out that the person who makes the final interpretation regarding the true meaning of all the evidence collected may be the person in charge of the pilot program, or it may be you or me, hundreds of miles away but trying to find leads to project a similar program with a reasonable chance for success.

With this background understanding as a frame of reference, perhaps we can proceed to the crux of the problem as it confronts most of this group as practitioners in the field. That crux is the procedure utilized in effective evaluation. Procedures utilized will determine the worth of the evaluative effort. Faulty procedures can only result in faulty evaluations. Assuming a good pilot program has been planned, the three major procedual steps in planning for the evaluation of that program must be:

1. Spelling out program goals or objectives

2. Collecting evidence concerning the process

3. Interpreting the evidences in terms of the objectives sought

If these steps are adequately taken, it should be possible to place a value on the process--in this instance the pilot program. I should like to discuss the steps in some detail.

Spelling out program goals or objectives.

I suspect the most difficult, if not the most critical, of the three steps will be the establishment of program objectives. I doubt if many of us have ever done this realistically with regard to the overall program of vocational education in agriculture. Some program innovations I have known about have merely been done for the sake of convenience, or to humor personal eccentricities. No one ever really took the time and the trouble to spell out just exactly what was proposed to be accomplished from an educational point of view. A few years ago I heard a teacher boast of the number of shipyard welders which he had turned out in his vocational agriculture mechanics program. He actually seemed offended when someone asked if the objective of his programs was to train shipyard welders. Although there is nothing whatsoever wrong in a boy's deciding to become a welder, the success of a program, which at that time was supposed to train farmers but which wound up training shipyard welders, must be questioned with regard to its effectiveness.

As important as the establishment of attainable objectives may be, the matter of stating these goals in terms which permit reasonable measures of accomplishment is equally important. To state that one's objective is to turn out students of "high moral standards" is to doom to failure from the beginning any effort to evaluate with any reasonable degree of objectivity the effectiveness of the program in terms of the accomplishment of stated objectives. To state that one is planning to

graduate skilled welders is a bit better. To state that one is planning to graduate skilled arc welders is somewhat more specific, but to plan to graduate skilled arc welders capable of performing at the minimum level acceptable for the apprentice program of the local trade association is not only to have a clearly defined objective but also an objective, the attainment of which may be readily measured.

I propose that if we are going to set up pilot programs in vocational agriculture to train off-farm agricultural workers we need to study much and confer long with employers and others with regard to the specific objectives (training competencies) which we are striving to accomplish. If the boy will be required to calculate feeding rations on his job we will want to state a clear cut objective: "the ability to calculate balanced feed ration for hogs, cattle and poultry." Even the student will know when this objective is reached. But if we want to make evaluation impossible let's set up the objectives to read, "advanced knowledge of livestock and poultry feeding practices." Let's strive for more clear cut specificity and less of the impressive double talk when we plan the objectives of our pilot programs.

While we are on this subject, I wish to call your attention to the repeated usage in the 1963 Vocational Education Act of the term, "training for gainful employment." I propose for your consideration the suggestion that most of the objectives of our pilot program should reflect those attainable levels of competency or degrees of mastery associated with entry level employment for a given occupation. We will do well to concern ourselves with the identification of those competencies which a prospective agri-business employee must possess if we are trying to plan a program to train such candidates for employment. Further, when we write up those objectives we should try to state them in terms and levels subject to measurement if we expect to be able to evaluate the outcome of the undertaking.

Securing evidence regarding the condition or process being studied.

This step is the most time demanding of all. Having established clear cut, measurable objectives, we must find or construct instruments or techniques for gathering evidence which depicts the degree at which the goal has been achieved. If the swimming coach sets as his objective that every student will be able to swim 50 yards backstroke in 35 seconds, then he must provide a 50-yard course, starters, and a timing device, along with a test schedule which will permit all students to measure their progress. At the end of the course, if 20 out of the 20 students reach the standard his objective has been achieved; if two fail his objective has not been achieved, but if only 10 reach the standard, his program has been even less successful with regard to that particular objective. Please note the qualification--with regard to that particular objective. He may have had other and more important goals which were reached but we would want measures or evidences regarding the progress toward the attainment of each specific objective. But in either instance he must have at his

disposal devices and procedures whereby evidence necessary to measure accomplishments or progress toward the achievement of the established goal may be gathered.

The type of evidence required or desired in a given situation will be dependent upon both the situation and the stated objective. It is needless to say that the effective application of evidence-gathering devices used is also dependent upon the competency of the evaluator or those assisting him. Sophisticated measuring devices in the hands of unskilled persons may not only be wasteful but actually potentially dangerous. Some types of evidence suitable for evaluative procedures are:

1. Observational data
2. Interview data
3. Anecdotal records, etc.
4. Data of quantity, quality
5. Objective test scores
6. Indexes of traits, characteristics, etc.
7. Rating scales
8. Historical records
9. Case studies
10. Progress charts

It will be necessary to report here that techniques appropriate to the kind of evidence sought will vary with the skill of the evaluator, the objective being measured and the total environment.

The matter of kinds of evidence to seek and the kinds of devices to utilize constitutes a very expansive and formidable area in which most of us in vocational agriculture would do well to try to obtain all the help available from our colleagues who are specializing in these fields of endeavor. The evaluation might be greatly improved if these people can be induced to help us, and in the end program improvement would be much more quickly realized.

Objective data or evidence has many advantages, but let us not dismiss too quickly the value of certain subjective evidence in evaluation programs. After all, subjective judgments are just as good as the person making the judgment. In some instances this is not only as good as you can obtain under the circumstances, but it may be just as good as you could use. The judgment of competent panels of juries can be used very, very effectively in evaluating pilot programs. This is especially true when the subjective judgments are interlaced with and corroborated by objective measurements. When subjective judgments are

considered to be desirable, every effort should be made to obtain unbiased judgments.

With regard to the use of questionnaires, interviews, rating scales, much has been written in the way of suggestions regarding procedures. While we are engaged in writing up budgets for the pilot program, we shouldn't overlook the possibility of adding a few dollars here and there for consultative services in order to get the assistance of trained assistants in these specialized areas.

Making a final judgment in light of all the evidence studied in an effort to determine the degree to which the objectives sought have been attained.

Of course this judgment is the finished product which the evaluator set out to find in the beginning--an answer to the initial question as to whether the program accomplished what it was designed to accomplish. This step involves analysis, interpretation, weighing of values and long and ardorous reflection. Statistical analysis to give meaning to the data may be necessary. The skillful evaluator will do everything necessary including the utilization of any assistance he can get in the critical task of relating the evidence found to the goals originally established. If the two previous steps in the procedure have been well done, the picture should begin to emerge--maybe not the picture hoped for, but nevertheless one which makes it possible for educators to accept or reject the pilot program as a directive of a new and better program.

May I review the principles discussed? They are:

1. Effective evaluations are continuous and not of the specific moment.

2. Effective evaluations are made in terms of specific goals or objectives.

3. Effective (complete) evaluations must involve the actual participation of the person or organization concerned in the process.

And the three procedural steps discussed are:

1. Spelling out program goals in objectives.

2. Collecting evidence concerning the process.

3. Interpreting the evidences in terms of the objectives sought.

And now just a word about the report of the evaluation. A report there must be if the evaluation effort is to contribute to the original aim--the improvement of the program itself. Pilot program leaders owe it to themselves, their associates, and the profession to record for future study the details of the program as planned and operated as well

as the findings of the evaluation effort. Whether the program proves to be highly successful or a dismal failure, a clear and unbiased account should be reported. It is the report which will assist other curriculum leaders who are struggling to improve programs of their own.

In reporting on pilot programs, educators are obligated to report as completely and accurately as possible all details of the program related to the setting and the established goals or objectives. The outcomes or evidences gathered by the evaluator should be reported in detail with any needed interpretations. It is not necessary for the report to deal with generalizations regarding the probability of similar outcomes being encountered in other situations. If the facts are clearly and succinctly reported, the task of relating them to other situations should and rightfully will fall on other shoulders. As someone has written, "so long as a doctor or a mechanic or a teacher deals with the diagnosis and treatment of a single case, they are acting as specialists, but when they begin to generalize with reference to the likelihood of obtaining similar responses in other situations they have projected themselves into the role of the researcher." I suspect most evaluators are more concerned with doing a good job at hand than in telling others what the solution is to their problems. On the other hand, if they leave a clear account of their labors and accomplishments, others may make valuable usage of them.

It occurs to me that I may have passed lightly over the obligations of a conscientious evaluator. He is obligated to at least form groups. They are:

1. The students involved in the program.

2. The local school and community.

3. The institution (state, region or nation) sponsoring the project.

4. The profession.

Perhaps I have dealt sufficiently with the latter two, but the first two merit consideration also. The immediate concern of the local school is to conduct the best program possible for its patrons. The major concern of the students enrolled in the program is to obtain an education. Let us hope none of us ever become so absorbed in the details of our evaluation assignment as to interfere with or detract in any way from the ongoing educational effort. After all, the welfare of the students is of primary concern to us all!

FACILITATING THE CHANGE PROCESS IN AGRICULTURAL EDUCATION

by
Daryl Hobbs
Associate Professor
Department of Rural Sociology
University of Missouri

It is perhaps ironical that at a time when social, economic and technological change is occurring at an unprecedented rate that so many groups, organizations, institutions, and agencies are concerned with facilitating change. However, the irony diminishes when we consider that change is itself a principal cause of change.(19, 22, 26, 29)*

Technological change in agriculture has resulted in substituting capital in the form of technology for labor. The result has been that many people have had to make adaptive changes by shifting from agriculture to employment in other sectors of the economy. These individual adaptive changes have resulted in outmigration from rural areas which in turn has caused schools, churches, businessmen and other rural community institutions to make adaptive changes. In each case the farm family, the school, and the community were making changes in response to other changes they had not initiated or were not responsible for. The change to which they responded had been initiated outside the community.

In the field of education Ross identifies 3 general kinds of forces (or changes) for change in educational institutions. These are: (1) changes in the social setting or environment in which the educational system functions, (2) the growing body of knowledge in most fields, and (3) the growing body of educational inventions.[1] In each case these are factors which are beyond the control of any individual school yet influence the decisions made in each school. Changes made in response to these forces are adaptive changes.

---

*The numbers, as used here, refer to the works listed in the Bibliography at the end of the paper.

[1]Donald Ross, "Administration for Adaptability," Metropolitan School Study Council, (New York: Columbia University Teacher's College, 1958), pp. 7,8.

Adaptive change of the kind illustrated will be the principal focus of this paper since it is assumed that one of the reasons why leaders in agriculture education desire to facilitate change is to develop viable programs which take into account the changing social setting and the growing body of knowledge and educational inventions to effectively meet the changing needs of the agriculture education clientele. It will be the purpose of the paper to draw from diffusion research in Rural Sociology and from research on organizational change in Sociology and Education to develop some generalizations regarding implementation and facilitation of adaptive change in education. Before proceeding with an analysis of change in education, a few minutes will be devoted to outlining the adoption process which has been developed by Rural Sociologists. The purpose is to provide a framework for the discussion of educational change.

The observation that people differ in their rate of acceptance and adoption of new ideas and practices has been the subject of major research emphasis in Rural Sociology and related fields during the past two decades. (20, 32, 33, 38, 39) Most of this research has focused on farming practices beginning when the individual becomes aware of a new technique and terminating with his decision to either adopt or not adopt the practice. This process has been envisioned as involving five stages.(33, 38, 39) The process for the individual begins when he becomes <u>aware</u> of a new method, product or idea. Diffusion research has typically found that farmers become aware of new ideas or practices from mass media sources such as farm magazines or radio and TV shows.(7, 20, 23, 33, 38, 39) At this stage he is only aware of the innovation and lacks information and detail about it. If the innovation has some appeal to the individual, he may be sufficiently interested to seek further information about it. At this <u>interest</u> stage mass media are still important sources of information but the farmer may also seek information from agriculture agency personnel, from his friends or neighbors or from commercial sources such as dealers, salesmen, etc.(33, 39) If after obtaining some additional information the individual is still interested in the possible application of the innovation he will seek further information to <u>evaluate</u> the idea or practice in terms of his own situation. In this <u>evaluation</u> stage personal sources of information such as friends and neighbors who have had some experience with the practice or government agencies such as Extension or Vocational Agriculture who have research information concerning application are most frequently sought for information. (7, 20, 33, 39)

If on the basis of the information obtained in the first 3 stages the individual feels that the innovation is applicable and would be of some value to him, he may proceed to try the idea. The <u>trial</u> stage is characterized by small scale experimental use of the idea or practice. If the results of the trial are satisfactory to him he may then <u>adopt</u> the practice and use it on a continuing basis. Although there may actually be a greater or lesser number of stages involved in the individual adoption process it has been found that adopters or practices can

distinguish one of the above stages from another and can designate points in time when they went through each of the above stages.(33, 39)

Depending on the individual and the type of practice the above process may take as little as a few hours or as much as several years. In the case of such practices as hybrid seed corn and 2, 4-D the adoption period (from time of awareness to adoption) took as much as 10-15 years for some individuals.(32, 33) Ross (36) points out that the adoption period for some educational innovations may be as long as 50 years. This is a point to which we will return later in the paper.

The difference between individuals in terms of their time of adoption of certain practices has been used to categorize individuals into adopter categories. It has been found that the adoption pattern for most practices tends to follow a normal curve, with relatively few people adopting the practice initially but with the rate of adoption increasing at an accelerating rate until at least 50 per cent have adopted the practice.(20, 33, 39) This normal curve of adoption has been used as the basis for establishing adopter categories. The first 3 per cent (2 standard deviations above the mean) have been referred to as innovators; the next 13 per cent (from 1 to 2 standard deviations above the mean) as early adopters; the next 34 per cent (from 0 to 1 standard deviation above the mean) as early majority; the next 34 per cent (from 0 to 1 standard deviation below the mean) as late majority; and the last 16 per cent (more than 1 standard deviation below the mean) as laggards.(20, 32, 33, 39) This same kind of pattern has been observed among doctors in the adoption of new drugs (6) among schools and school administrators and teachers (25, 27, 28, 36), and for a wide variety of farm practices.(32, 33, 39)

The relative time required for a particular practice to go from inception to virtually complete adoption depends on several characteristics of the innovation. Generally those practices which are low in initial cost and are high in marginal returns will be adopted at a much faster rate than practices or innovations characterized by either high initial costs or relatively low marginal returns.(17, 33, 35, 39) Thus the relative economic advantage is a major factor affecting the rate and universality of adoption.

A second factor affecting rate of adoption is the relative complexity of the idea or innovation. Those ideas which are relatively easy to understand are adopted at a faster rate than those kinds of ideas or practices which are difficult to understand and/or involve a major change of enterprise. Kivlin (17) found complexity to be second only to relative economic advantage as a factor affecting rate of adoption of a large number of farm practices.

Another factor affecting rate of adoption is the visibility of results. Those practices for which the results may be easily observed (such as chemical weed spray) are adopted at a faster rate than practices where the results are less visible.(33)

The rate of adoption of a particular practice is also affected by the extent to which it is divisible. A product or idea which may be tried on a small scale, experimental basis before proceeding to full scale use is generally adopted faster.(33) A chemical weed spray can be used on a small scale basis whereas a bulk milk tank cannot.

The final factor to be considered is compatibility or congruence. That is the extent to which the idea or practice is consistent with, or related to, previously adopted practices. For example, Brandner and Kearl (3) found that adoption of hybrid sorghum proceeded at a much faster rate in a corn growing area of Kansas than in a non-corn growing area even though sorghum was more economically important in the non-corn area. Their conclusion was that the experience of corn growers with hybrid corn lead them to adopt other hybrids faster than those who had had no previous experience with hybrids.

In summary of their research, Brandner and Kearl raise an interesting question which seems to be apropos to the discussion of adoption of educational practices to be presented later in the paper. They question: "Would some of the rapid changes in agriculture in the recent years be explained by a hypothesis that 'willingness to accept innovations' has been evaluated and adopted? Is the general innovator perhaps the farmer who has considered and accepted the idea of using innovations and therefore accepts a wide variety of innovations as congruent with his general appraisal of innovation without feeling a need to study each one as skeptically as he otherwise might?"[2] To draw a comparison, the question may be raised at this point regarding the extent to which schools and educators have adopted a "willingness to accept innovations"?

As mentioned above, the rate of adoption of practices is affected not only by the characteristics of the practice but also by the characteristics of the individual and the social system into which the practice is introduced. Innovators have different characteristics than laggards.

As a generalization from all previous adoption, research innovators are younger, more highly educated, farm larger and more specialized operations, have more favorable attitudes toward science and the acceptance of risk, read more, travel more, attend more meetings and obtain information from more specialized sources than those who are later adopters.(20, 33, 38, 39) It has been found in several studies that innovators often obtain information about new practices directly from research personnel and specialists.(20, 33, 38, 39)

---

[2]Lowell Brandner and Bryant Kearl, "Evaluation for Congruence as a Factor in Adoption Rate of Innovations," Rural Sociology, Vol. XXIX, 1964, p. 303.

Although innovators are characterized by high socioeconomic status, it has been found in several studies that innovators are not usually adoption or opinion leaders on new practices.(20, 23, 33) Rather is the early adopters (who are perceived as following more closely the norms of the locality) which are looked to most often by others as a source of information and legitimation on new practices.(16, 20, 33) For this reason once a particular practice has been adopted by early adopters there usually follows a rapid period of adoption by the early and late majority. Thus from the standpoint of change agents (persons promoting adoption of certain practices) effort expended with adoption leaders is one means of accelerating the rate of adoption for a particular practice or idea. In this way the change agent is able to indirectly affect others who look to adoption leaders for information and legitimation.

Regarding the effect of information in the adoption process some other generalizations from diffusion research which are relevant to this discussion include:

1. Impersonal sources of information are more important than personal sources for relatively earlier adopters of innovations than for later adopters.

2. Earlier adopters utilize information sources that are in closer contact with the origin of the idea than later adopters.

3. Personal influence from peers is more important for relatively later adopters.[3]

To reiterate the point made above, diffusion research indicates clearly that change agents are not only more accepted by adoption leaders but also can have a greater affect on adoption rate by concentrating their efforts on opinion leaders.

The primary purpose of the discussion thus far has been to set forth the framework which has been used to study the diffusion process of ideas and practices. With this framework as a background the following discussion will be focused on the change process in education and factors which retard and facilitate change. Additional research findings from diffusion studies will be presented where applicable to facilitating change in education.

---

[3]Everett Rogers, Diffusion of Innovations, (New York: Free Press of Glencoe, 1962), pp. 313, 314.

A major difference between the adoption of new ideas in education and in farming is that in education the idea is adopted and applied in a formal organization where the practice affects not only the adopter, but also others in the organization as well as those served by the organization. Thus, the potential adopters of an educational innovation whether a teacher or administrator must take into account not only his own preferences but also the preferences and attitudes of other teachers, the students, the public and organizations which are ancillary to the educational structure.

Thus the decision to adopt or not adopt is not one which can be made by the individual without legitimation from all parts of the system in which he functions.

In American society great emphasis is placed on local control of schools. This means that the public through expression of opinion and through delegation of authority to members of the school board are in a position to influence and to loosely control the local school. This creates the circular process whereby the public controls the school but at the same time the school through education is attempting to change the public. The importance of the community as an influencing factor on schools has been emphasized in research by Mort and Cornell (28) and by Duncan and Kreitlow.(9) Mort and Cornell found that attitude of the community toward education was second only to expenditure per pupil as a factor related to quality of education and implementation of changes in education. Duncan and Kreitlow found that the attitude of heterogeneous communities was more receptive to educational change than the attitudes of homogeneous communities. Thus, the interaction between school and community is a structural element which affects change in education. This is a factor which can be ignored by the individual adopter but is difficult for the educational system to ignore. It is probable that the vocational agriculture teacher is especially sensitive to the feelings and attitudes of the public since he perhaps works more directly with a segment of the public than other teachers. This relationship is particularly important since he may be subjected to cross pressures from those who argue that vocational agriculture should be deemphasized and young people discouraged from farming as opposed to those who argue that the need is greater than ever.

Sloan Wayland (40) points out that the formal educational system represents only part of the educational structure. In addition there are ancillary structures which have an influence on the educational system. Included are such systems as PTA, NEA, FFA, and textbook publishers. Each of these groups and organizations although having a general interest in education also have some vested interest which may cause them to resist changes in education. Thus, these systems are also a part of the social setting in which educational systems function and thus may be enhancing or impeding factors in educational change.

A further comparison between adoption of a new idea or practice by a farm operator and adoption of an innovation in education reveals a lack of a formalized research and diffusion function for educational innovations. In education there is no direct equivalent to the Agriculture Experiment Station and Extension system to generate and recommend new educational practices. Most research on adoption of farm practices has been concerned with those practices which have been recommended (and thereby legitimized) by the Agriculture Experiment Stations. Although research in educational innovations is carried on, there is no comparable system for recommending and disseminating the research to potential adopters.(21)

Thus, the fact that schools are institutions which are interdependent with a community social system and which have no formalized structures for generating and communicating research on innovations has many implications for facilitating change. The remainder of the discussion will be devoted to these implications.

In discussing these implications some additional propositions about change may aid in guiding the analysis.

1. Innovation in education as in any system involves changes in the social organization of the system. Every system has norms to guide behavior in situations. A change in the system usually results in a change of these norms. Following from this proposition,

2. Innovation is deviation. By virtue of the fact that an innovation is a new way of performing some purpose it is different from existing methods and norms governing their application.

3. Adoption of a practice is a means to achieve some other end. Generally the innovation is considered by those who develop and recommend it to be a more efficient means of achieving the ends or objectives of the system. However, without a clear definition of the end or goal it is not possible to evaluate the relative effectiveness of means to be employed.

Thus an innovation in education may be considered as a deviation from existing methods which will have some effect on the social organization of the school system and which, if applied, will enable the system to more effectively accomplish it's objectives.

It is generally accepted that technological change has been beneficial to society. It has resulted in a higher standard of living, more leisure time, improved health, and increased life expectancy. Although many theories have been proposed to account for technological change it is generally agreed that for technology to be developed and adopted there must be some system of providing rewards to the innovator and adopter.(1) In our society these rewards are usually in the form of increased status, greater income, and more leisure time.

In farming, for example, the individual who adopts an innovation may expect to increase his profit or make a difficult job easier to perform. Regardless of the nature of the advantage the adopter bears the risk (of possible failure) but also receives the benefit. This advantage may be considered as a major incentive to adopt new practices. (35)

However, despite the advantages which accrue to the developer and adopter of new technology there are certain factors which cause resistance to change. As pointed out by La Piere: "Since the beginning of the industrial revolution those in almost every occupation - law and politics have been major exceptions - have experienced a more or less constant devaluation of their skills and knowledge as a consequence of technological change, of organizational changes within the occupation, or both."[4]

How do these factors encouraging innovation compare with those resisting the innovation function in education? In the educational system there are few, if any, rewards provided by the system to serve as an incentive to innovate.(22, 25) In fact the reward system in education may have the opposite effect since most salary scales are based on a combination of experience and amount of formal education. This procedure is not necessarily dysfunctional since it has been found that both these factors are positively related to quality of education in a school system.(28) However, going back to La Piere's comment concerning devaluation of skills and knowledge as a result of change in methods and technique, it can be observed that educational innovations tend to discount the value of experience and <u>previously</u> acquired knowledge. The hypothesis could be generated then that persons in education who have experience could be expected to resist changes which discount the value of experience. There is no question that craftsmen resist mass production and automation.

While there are few positive rewards for innovation in education neither are there many negative sanctions for failure to utilize new methods. In farming the individuals who have not adopted new techniques and practices have not remained in farming. It is doubtful if there is (or should be) any equivalent penalty for the laggard or non-adopter in education. However, this factor does have implications for the acceptance or rejection of innovations.

---

[4]Richard T. La Piere, <u>Social Change</u> (New York: McGraw-Hill Book Co., 1965), p. 194.

In addition to sanctions (positive and negative) provided directly by the educational system the ancillary structures and the community also play a part in establishing the norms of teacher role performance. As cited previously research has indicated that the attitudes and characteristics of the community are significant factors in educational change and innovation.(9, 25, 28, 36) In their study of Pennsylvania schools Mort and Cornell (28) asked teachers their opinions concerning the rules for success of a teacher in their community. In order of the number of times mentioned the responses were: (1) good teaching (2) understanding of students (3) active in community affairs (4) cooperativeness (5) character and personality and (6) morality. All these factors indicate a consciousness of community norms as a factor in the success of the teacher. Among the factors mentioned least often by the teachers were factors related to innovation such as initiative, personal adaptability, energy and vision.

The important consideration from the standpoint of change is that the teacher's and the school administrator's perception of the community's possible reaction to change may cause reluctance to innovate. The term perception is used because there is generally a lack of formalized mechanisms to objectively evaluate public reaction prior to making a change. Lacking this information a school administrator or teacher may be reluctant to make changes because they feel the community would react negatively. Whether the reaction would be negative or not is somewhat irrelevant if the teacher or administrator believes it would be. As stated by I. I. Thomas: "If men define situations as real, they are real in their consequences."[5]

In diffusion research one of the factors which has been found to affect the rate of adoption of new ideas and innovations is communication with, and influence of peers. As mentioned previously, once adoption leaders have adopted a new idea the rate of adoption tends to increase at an accelerating rate. Farmers are in close association with each other and are in a position to observe the practices being followed by other farmers. However, especially in vocational agriculture the teacher is specialized with no direct equivalents at the local level. Thus the lack of opportunity for day to day interaction with peers eliminates an important means of communication about innovations. Mort (27) suggests that lack of communication, either with change agents or peers, is an important factor retarding the adoption of innovations in education.

In addition to merely conveying information about innovations personal communication is also effective in reinforcing the decision of an individual. It has been found in social-psychological and diffusion research that personal influence is more important in uncertain situations (such as uncertainty about reaction of administration or public) than in clear-cut situations.(33) As suggested by Lionberger, "..reinforcement

---

[5]Robert Merton, Social Theory and Social Structure (Glencoe, Illinois: The Free Press, 1959), p. 421.

of an adoption decision may be necessary for continued use of an idea or practice particularly if local support of colleagues and important reference groups is not forthcoming. In a highly change-oriented society this may not constitute a problem because peer group support is readily accorded as for successful use of innovations in farming. This may be less true in educational innovation than in agricultural development."[6]

The sources utilized by teachers for information on new ideas in education were reported in the results of a study by Mort and Cornell.[7] In order of the number of times mentioned by the teachers the sources of information were: (1) professional literature (2) teaching experience (3) observation of other schools in the system (4) college or university (5) study of pupil needs and interests (6) contact with other teachers in system (7) summer school (8) general literature (9) conventions, conferences, etc., and (10) original ideas. As may be noted peer group influence (6) apparently is much less important among teachers than has been found among farmers.

As discussed in relation to the adoption of farm practices the characteristics of the practice also affect the communicability and rate of adoption of a practice. Many of the innovations in agriculture have been material innovations which can be purchased and thus readily adopted. It has been found in diffusion research that material changes are adopted at a more rapid rate than non-material.(33) The idea that material change occurs more rapidly than non-material is a basic proposition of Ogburn's well-known theory of cultural lag.(29) It is Ogburn's thesis that adoption of technological change "causes" or forces adaptive change in social institutions.

In education many or most of the innovations involve non-material changes. Such changes are not only more difficult to communicate but also require a change in behavior of the adopter. In addition the results of application of non-material changes are usually less visible and consequently more difficult to evaluate. Adoption of a chemical weed spray,for example,is a relatively simple adoption process which can be easily evaluated. This type of practice can be compared with adoption of overhead projectors for classroom use. In both cases they are simply an easier, more effective way of doing the same job. Their use involves no basic change in behavior.

[6]Herbert F. Lionberger, "The Diffusion of Innovations with Applications from Agricultural Research to Implemented Change in School Systems." Paper presented at the Association for Supervision and Curriculum Development Seminar on Strategy for Curriculum Change at New Orleans, Louisiana. January, 1965, p. 25.

[7]Paul Mort and Francis G. Cornell, American Schools in Transition. (New York: Bureau of Publications, Teacher's College, Columbia, 194. , p. 264.

However, most educational innovations are more complex which adds to the difficulty of diffusing, understanding and properly utilizing the innovation. It was mentioned earlier that Kivlin found that the relative complexity of the practice was second only to relative economic advantage as a factor determining rate of adoption of practices.(17)

Thus the fact that educational innovations are more complex and are primarily ideas rather than objects is a factor which undoubtedly retards the rate of adoption.

In addition to diffusion research, studies of organizational change have identified many factors which may cause resistance to change.(5, 41) These studies have been primarily of employee reaction to changes adopted by the employer. In summary of the findings it can be generalized that there is least resistance to organizational change when the persons affected have been involved in making the change.(5, 41)

In both Zander's study and in a similar one by Coch and French it was found that when the reason for the change, the purpose to be accomplished and how the change was to be implemented were discussed with employees prior to initiation that the changes were accepted with little or no resistance. By involving the employees in this fashion they had the feeling that they had had a voice in making the change decisions. As pointed out by Zander, "Resistance can be expected if the nature of the change is not made clear to the people who will be influenced."[8]

This raises the question about the process of legitimation for educational changes. As indicated earlier the nature of the relationship between public and school means that certain segments of the public are also influenced by educational changes. Based on the above generalization of Zander this suggests that in education certain relevant sectors of the public may need to be consulted and informed prior to making a change. This would reduce the possibility of public resistance to it. Of course the need for such public legitimation would depend on the magnitude of the change.

Zander also concludes that "Resistance can be expected when those influenced are caught in a jam between strong forces pushing them to make change and strong forces deterring them against making change."[9] This generalization seems to be particularly applicable to agriculture education. As suggested earlier there may be cross pressures on the vocational agriculture teacher as a result of the changes taking place in agriculture. As a result, rather than stimulating change these cross-pressures may result in a resistance to change.

[9]Ibid.

A previous proposition stated in the paper was that adoption of an innovation is a means to achieve an objective. From the standpoint of facilitating adoption of innovations it is important to first define the problem or the objective to be accomplished.(36) With agreement on the objective, agreement on the means to be employed and the function of innovations can be facilitated. Resistance to a change may result simply from a difference in understanding of the objectives to be accomplished.

To this point major emphasis in the paper has been devoted to a discussion of factors which may retard acceptance of change in education. The logic for this approach is that facilitating change must begin by first identifying factors causing resistance and then subsequently overcoming these resistances.

Therefore following from the preceding discussion several generalizations can be derived which pertain to implementing or facilitating change in education.

In discussing the framework employed in research on diffusion of farm practices it was pointed out that the rate of adoption of farm practices tends to follow a normal curve and that the rate of adoption increases at an increasing rate after the practice has been adopted by adoption or opinion leaders. To the change agent this finding would seem to suggest a number of important considerations:

1. In the adoption process greatest effort by the change agent is required initially. Once the adoption process has begun the two-step flow of information helps to perpetuate the process <u>if</u> potential adopters are in communication.

2. The rate of adoption may be facilitated if initial effort by the change agent is concentrated on adoption or opinion leaders. Not only do adoption leaders influence others to adopt but they are more easily reached by change agents.

3. Who are opinion leaders within the system? It is obvious that the change agent cannot focus his efforts on opinion leaders unless he knows who they are.

The nature of the educational system however modifies these considerations to a degree. Opinion leadership and the influence of opinion leaders is dependent upon interpersonal communication. As emphasized earlier, teachers do not have the opportunity to communicate with teachers in other systems as farmers communicate with their neighbors. This implies that before interpersonal communication can be relied on as a means of disseminating information about educational innovations that some enabling mechanism may need to be provided.

Interpersonal communication is important not only as a means of disseminating information but also in reinforcing adoption decisions. Initial adoption of an innovation by an innovator may be deviant behavior, however, adoption of the practice by adoption leaders serves to legitimize the innovation and make it normative. Thus for others who follow in the adoption process, adoption is not considered a deviation but as following an accepted practice.

These considerations lead to the specific suggestion that the adoption of innovations in education could be facilitated by providing opportunities for interpersonal communication (other than annual conferences) between teachers from different systems and even within the same system oriented toward the discussing of new ideas and practices and their application in achieving system goals.

Such meetings would also provide the opportunity to teach a consensus on the objectives of a particular program such as vocational agriculture and thereby emphasize the need for adaptive change to accomplish these objectives.

Some changes in education can be adopted by a teacher on his own whereas other changes may require the decision of the administrator or school board or a higher authority. Although the implication is obvious, the change agent should determine initially who has the authority to make the adoption decision. In this regard, Wayland makes the point that, "Successful innovations are more likely to be achieved when initiated by administrative officials, not only because of the power of their office, but also because they are in a position to handle the system problems inevitably associated with innovation in an ongoing system."[10] Miles also suggests that "...successful innovation at the local school level is likely to require work with the entire organization as such rather than solely with individual teachers."[11]

The need for legitimation of educational innovations in order to facilitate their adoption touches on many of the factors discussed in the paper. It was pointed out that in agriculture the Agricultural Experiment Stations not only generate innovations in farming but also perform a legitimation function by recommending the practice. To illustrate this legitimation function of the Ag. Experiment Stations nearly 50 per cent of a sample of Iowa farmers agreed with the following statement, "I feel the research information put out by agricultural colleges is just as good to go on as if I had tried it on my own farm." (14) It was emphasized earlier that even though research on educational innovations is being performed there is no system comparable to the

Ag. Experiment Stations and Extension to recommend, legitimize and disseminate the information. Since such legitimation from knowledgeable sources has been found to positively affect the rate of adoption of farm practices (33) it suggests that a similar function could positively influence the adoption of educational practices.

Since education is a public institution, the public also becomes an important consideration in the legitimation of educational changes. It was pointed out previously that public reaction to an educational change is probably an uncertainty to the teacher or administrator contemplating change. This uncertainty probably stems from the fact that there are few formalized mechanisms for gauging reactions prior to making a change unless, of course, the change is one which involves the public directly such as a bond issue, or school reorganization.

Since the possibility of negative public reaction may be a factor causing reluctance to change, it is suggested that vocational agriculture teachers could be encouraged to legitimize contemplated changes in their programs with key agricultural leaders in the community. By utilizing key leaders in this way the teacher could gain their support and add to his confidence in making a change. Such legitimation, of course, would be necessary or important only for major changes in the program.

In addition to legitimation with the vocational agriculture clientele it goes without saying that legitimation with administrators and fellow teachers is also important to insure their support of the proposed change.

There are several other implications of adoption research in agriculture and education which suggest considerations for educational change agents.

Just as in farming not all innovations apply to all school systems. The type of enterprise, the size of the operation and the ability of the farm operator are some of the factors which determine whether or not a particular practice is applicable for a particular farm or not. Knowing this, the effective agricultural change agent concentrates his efforts on those who are potential adopters. In education the size of the school, the type of physical facilities, the education and background of the teacher and the type of community are all factors which determine whether an innovation is applicable. The educational change agent in developing a strategy for change would need to determine the potential adopters of the innovation and concentrate his efforts on these.

Adoption research has also found that different kinds of information sources performing different functions are employed at varying stages of the adoption process. To the change agent this finding suggests the need to develop a plan for change which incorporates a number of means of communication, each planned to provide the type of information required at each state of the adoption process. These means of communication should also be selected on the basis of access to the individual or group who makes the adoption decision.

The communication strategy developed to facilitate the adoption of innovations needs also to take into account the characteristics of the practice. It was pointed out previously that many educational innovations are complex and require major changes in the behavior of the adopter and in the system in which it is adopted. This suggests the importance of intensive and personal communication as a part of the strategy for change. The potential adopter not only needs to be influenced to try the practice but may require training to effectively use the innovation. If the idea is accepted but implementation is unsuccessful this can retard the adoption of the practice by other systems. Thus the strategy for change may need to incorporate plans for training on application of the innovation to ensure its successful adoption.

The final consideration to be mentioned concerns the overall change orientation of both change agents and target systems. A previous quote included in this paper raised the question: "Would some of the rapid changes in agriculture in recent years be explained by a hypothesis that 'willingness to accept innovations' has been evaluated and adopted? Is the general innovator perhaps the farmer who has considered and accepted the idea of using innovations and therefore accepts a wide variety of innovations as congruent with his general appraisal of innovation without feeling a need to study each one as skeptically as he otherwise might."[12] The implication of this question is emphasized by Rogers who suggests that, "change agents should be more concerned with improving clients competence in evaluating new ideas and less with simply promoting innovations per se."[13] As suggested above not all innovations are applicable to all educational systems. However, educational systems do have in common the need for adaptive changes to keep pace with societal and community changes. Thus the consideration is offered that change agents may be more effective in the long run by developing on the part of the target system a recognition not only of the importance of a particular change but of the need for continual evaluation and change to keep abreast of societal changes.

In conclusion the key points emphasized in this paper lead to the generalization that change in educational systems can be expedited by first identifying the probable sources of resistance to change. Once these have been identified a strategy can be directed toward overcoming these resistances. The factors discussed in the paper as considerations for the educational change agent can perhaps be summarized by the suggestion that education rather than promotion per se may be the most effective means of facilitating change in educational systems.

FACTORS AFFECTING THE ADOPTION OF EDUCATIONAL INNOVATIONS BY TEACHERS OF VOCATIONAL AGRICULTURE WITH ATTENDANT IMPLICATIONS FOR FACILITATING CHANGE

by
James E. Christiansen
Consultant, The Center for Vocational and Technical Education
The Ohio State University

Dr. Hobbs has focused our attention in this seminar on ways in which the change process in agricultural education may be speeded up. He has succinctly summarized the results of research efforts in other disciplines, has drawn together, and has tied them to research completed in education. He has raised questions about "legitimatizing" educational changes, about the different problems encountered in facilitating changes involving institutions and those involving individuals, and has pointed out that most attention in education has been directed to creating changes in the school system rather than to the individual within that system.

For the next few minutes, let us focus attention on factors affecting the adoption of educational innovations by individual teachers of vocational agriculture as revealed by one study conducted in Ohio. Then, too, it would be appropriate to highlight some of the implications arising from this study for programs of supervision and teacher-education in agricultural education. This particular study was conducted to determine the relative influence exerted by different sources affecting the adoption of specific educational innovations among experienced teachers of vocational agriculture in Ohio who had been identified as being members of specific innovation-adopter categories. It involved 101 teachers representing 39 per cent of the vo-ag teachers in Ohio who had taught at least three years. Persons who had taught at least three years were selected to ensure that those studied would have had an opportunity to be influenced by and to utilize sources of educational innovations other than those inherent primarily in the pre-service program of teacher education. These teachers had taught 15.7 years on the average and were teaching in districts representative of agricultural, educational, and socioeconomic conditions within the state. Five practices were studied in detail based on the following criteria:

1. The practice was one which could be conducted by the teacher rather than by the institution.

2. The practice was one which could be adopted or rejected without having to consider administrative approval, major budgetary limitations, community sanction, class schedule or work schedule changes, or school board policy.

3. The teacher was free to adopt or reject the practice himself.

The practices selected pertained to the professional aspects of the teacher's work involving educational innovations. They did not apply to agricultural or subject-matter innovations.

Teacher-innovativeness was measured by means of an adoption scale made up of individual innovativeness scores derived from twenty-seven innovations involving two factors, namely, the length of time it took a teacher to adopt an innovation and the number of innovations adopted that could have been adopted. The total rankings of the individuals on the basis of their innovativeness scores were then arrayed and classified into the five commonly accepted adopter categories of innovator, early adopter, early majority, late majority, and laggard on the basis of the two parameters of the normal distribution, namely, the mean and the standard deviation as explained by Dr. Hobbs earlier today. The method used to determine innovativeness avoided the inadvertent interjection of subjection bias that might have arisen if outside judges had ranked teachers on the degree of innovativeness that they possessed.

As another phase of the study, a two-way, forced-choice comparison-of-pairs instrument was used to determine whether or not supervisors in each supervisory district could identify innovativeness among teachers of vocational agriculture. Teacher were also asked sociometric questions to determine if different degrees of innovativeness were perceived among teachers by their peers.

Before examining those factors affecting the adoption of educational innovations by these Ohio teachers, let us examine some of the general characteristics of teachers in each of the adopter categories enumerated by Dr. Hobbs. In other words, let us dissect this teacher-specimen in-so-far as innovativeness is concerned.

1. The more innovative the experienced teacher was, the greater the amount of education he was likely to have obtained in a formal credit program since his initial certification. Innovators had earned 44.7 quarter hours of credit whereas laggards had earned 18.3 quarter hours. The other three categories decreased progressively in terms of credit earned, being less than the innovators and more than the laggards. The innovators also had earned 3.7 times more quarter hours of college credit than had the laggards for each year of teaching experience accumulated.

2. The more innovative the experienced teacher was, the greater the amount of money he was likely to have invested in professional growth.

3. The more innovative the experience teacher was, the greater the number of professional visits to departments of instruction other than vocational agriculture he was likely to make on his own initiative.

4. It was also true that the more innovative the experienced teacher was, the greater the number of purposeful visits to other departments of vocational agriculture he was likely to make on his own initiative.

5. The more innovative the experienced teacher was, the greater the number of non-local professional meetings he was likely to attend. This was true both for meetings attended within the state outside the country

in which the teacher taught and for meetings attended outside the state. The innovators, of all the adopter categories, were the most cosmopolite in meetings attended.

6. The more innovative the experienced teacher was, the greater the degree of opinion leadership which he was likely to hold. This was true both for elective offices held by teachers within the three years prior to the collection of the data and nominations made by fellow teachers as to whom they would go for advice before using a new educational practice and from whom they would be willing to "borrow" a new teaching practice on the strength of the fact that they had observed a teacher using the practice. It was also found that all of the early adopters in the study were named by fellow teachers as being persons from whom they would "borrow" a new practice being used or to whom they would go for advice concerning new educational practices. This was not true of the other categories and bears out previous research that the early adopters are the greatest opinion leaders.

7. The more innovative the experience teacher was, the fewer the number of years of total teaching experience and the fewer the numbers of years of teaching experience in the present school system the teacher was likely to possess. These findings were found to progress directly from the most innovative to the least innovative, but the differences among the different adopter categories were not significant at the .05 level. Innovators had taught 12 years on the average, those in the majority 15.5 years, and laggards 18.4 years. Innovators had taught 8.7 years in the present school system, those in the majority about 10.6 years, and laggards 14.8 years.

8. The more innovative the experienced teacher was, the younger he was likely to be. The mean age of each of the adopter categories increased progressively from the innovator through laggard categories. However, significant differences among the five adopter categories did not exist. The range for all categories was only 5.0 years.

9. Laggards difinitely read fewer professional publications regularly than did the other adopter categories. However, the differences among the other four categories were minor and statistically significant differences among all five categories did not exist. Only 38 per cent of the teacher in the population sampled read their professional journal, The Agricultural Education Magazine, regularly.

10. The more innovative the experienced teacher was, the more likely he was to adopt a complex innovation, such as color dynamics, which had not been actively promoted by state staff personnel. Along this same line, the most commonly cited reason for adopting the five practices investigated was that it was implied by state staff

personnel that this was the thing to do. The second most common reason was that the teacher had observed it being done somewhere else and thought that it was worth doing. Significant differences among adopter categories did not exist at the .05 level when the Chi-square test was applied to the reasons given for adopting the practices investigated. Not being convinced of the value of a practice was the most common reason given for not adopting a particular practice. Again, differences did not exist among categories in this respect.

11. Significant differences among adopter categories did not exist in respect to the length of time from awareness to adoption of the five practices studied. It was true, however, that the more innovative the individual was, the shorter was the period of time lag between awareness and adoption generally speaking.

12. As would be expected, the mean number of innovations adopted by teachers decreased progressively from the most innovative to the least innovative adopter category. However, the differences among the adopter categories in this regard were not statistically significant at the .05 level. The innovators, on the one hand, adopted 23.0 innovations; the laggards had a mean adoption rate of only 10.7 innovations.

13. The more innovative the experienced teacher, the more likely he was to have classes for out-of-school youth and adults in operation. This finding was statistically significant at the .05 level.

14. The more innovative the experienced teacher was, the greater the use he was likely to make of impersonal sources of information.

15. The more innovative the experienced teacher was, the greater the use he was likely to make of sources outside of agricultural education.

16. Significant differences among adopter categories did not exist in regard to the use of non-local sources of information.

17. The more innovative the experienced teacher was, the greater the use he was likely to make of sources of information requiring large personal investments in time and money. The exception, though, was the innovator. He tended to be a "tightwad" in terms of spending his own money to make use of available sources of information.

18. Members of the early majority category spent more personal money on materials for their own instructional programs than did members of the other categories. The laggards spent the least, followed by the innovators, late majority, and early adopters in that order.

19. The level of instruction expenditure per pupil in a school district did not furnish a clue as to where one could expect to find the more innovative or less innovative individuals. No appreciable differences among adopter categories existed.

20. Teachers in all adopter categories possessed little occupational experience outside the teaching field. Differences among adopter categories did not exist which were significant. The mean number of years of experience outside the teaching field for all categories was 1.6 years.

Let us now examine some of the forces and factors affecting the adoption of educational innovations by teachers. For example, it was found that:

1. The different sources providing information influencing the adoption of the five educational innovations studied varied according to the adopter categories to which the teachers belonged but did not reach the .05 level of significance. In analyzing the use of the different sources, a definite progression in frequency of use by adopter categories was revealed in eleven of the twenty-eight sources used. They were as follows:

   a. The more innovative the experienced teacher was, the more likely he was to use university staff members in agricultural education as sources of information.

   b. The more innovative the experienced teacher was, the more likely he was to use university staff members, other than those in agricultural education or education, as sources of information.

   c. The more innovative the experienced teacher was, the less likely he was to use state staff supervisors in agricultural education as sources of information.

   d. The more innovative the experienced teacher was, the more likely he was to use original ideas.

   e. The more innovative the experienced teacher was, the more likely he was to use graduate level courses as sources of information. Not a single laggard reported that a graduate level course furnished information for any stage of adoption of any of the five practices investigated. However, it was not determined if the laggards had been enrolled in courses that would have provided information about the five practices studied.

   f. The more innovative the experienced teacher was, the more likely he was to use publications in professional education as sources of information.

g. The more innovative the experienced teacher was, the more likely he was to use local research as a source of information.

h. The more innovative the experienced teacher was, the more likely he was to use teachers in the local school system, other than teachers of vocational agriculture, as sources of information. The only exception was that of the innovators; none of them reported using this source.

i. The more innovative the experienced teacher was, the less likely he was to use the annual conference for teachers of vocational agriculture as a source of information.

j. The more innovative the experienced teacher was, the more likely he was to use cooperating teachers he had known or with whom he had worked as sources of information. The more innovative 50 per cent of the teachers used this source four times more often than did the least innovative 50 per cent.

k. The more innovative the experienced teacher was, the more likely he was to use local farmers as sources of information.

Other findings concerning the use of different sources which influenced the adoption of innovations revealed that:

a. Popular publications such as magazines and newspapers were used by members of the late majority as sources of information than by any other category.

b. With the exception of the laggard, the less innovative the teacher was, the more likely he was to use non-credit workshops, including district meetings, as sources of information. Members of the late majority used such sources 2.6 times more frequently than did the laggards.

c. With the exception of the innovator, the more innovative the teacher was, the less likely he was to use other teachers of vocational agriculture as sources of information. The innovator, though, used teachers other than vo-ag teachers twice as often as did the early adopters.

d. Experienced teachers in the two majority categories used administrators or supervisors in the local school system as sources of information twice as much as did the other three categories.

e. Teachers in the early majority used in-service workshops or clinics in the local school system as sources of information more than did the two adjacent categories. Neither innovators nor laggards reported using this source.

2. Experienced teachers of vocational agriculture are influenced by different sources at the awareness stage, the interest stage, and the adoption stage in the innovation-adoption process. Sources of information which were more important in making teachers aware of new practices than in providing additional information or influencing teachers to adopt the practices were:

   a. Teachers in the local school system, other than vocational-agriculture teachers

   b. Cooperating teachers known by the teacher

   c. Local sales, business, and service people

   d. Visits to other departments of vocational agriculture

   e. Popular publications such as magazines and newspapers

   f. Graduate level courses

   g. Annual conference of teachers of vocational agriculture

   h. University staff members in agricultural education

   i. University staff members other than in education or agricultural education

   j. Undergraduate courses

   k. Childhood teachers

   Those sources which were of most importance in providing additional information or interest in a given practice were administrators or supervisors in the local school system, local farmers, published results of educational research, commercial publications and advertisements, non-credit workshops for teachers of vocational agriculture, including district meetings, other teachers of vocational agriculture, and state staff supervisors in agricultural education.

   Those sources of information which were most influential in causing teachers to adopt educational innovations were local research, publications in professional education, and in-service workshops or clinics in the local school system.

3. Eight of the nine most frequently used sources of information as reported by teachers were directly associated with the field of agricultural education. These sources made up 76.5 per cent of all sources of information used. In descending order of frequency of use, the

sources were state staff supervisors in agricultural education, department of agricultural education staff members, annual vocational agricultural teachers' conference, other teachers of vocational agriculture, non-credit workshops for vocational agricultural teachers including district meetings, visits to other vocational agricultural departments, graduate level courses, and cooperating teachers. The one source of information not directly associated with agricultural education, but ranked fifth in importance, was that of administrators or supervisors in the local school system.

All nine of these sources just mentioned were used by members of all adopter categories. In addition, four other sources of information were used by members of all adopter categories. They were commercial publications and advertisements, university staff members other than those in education or agricultural education, local farmers, and local research. It was interesting to note that commercial publications and advertisements were used almost twice as often as publications in professional education for sources of information.

4. Something else was found when considering age and opinion leadership among the teachers investigated. Two structures were found to exist. A small group of thirteen younger teachers in the total sample of 101 existed who did not consider as opinion leaders those persons so considered by the majority of the teachers. Instead, those persons were considered more cautious or conservative and these thirteen "young Turks" with an average age of 30 years went to peers their own age for advice.

5. Another factor affecting the adoption of educational innovations by teachers was that those who entered the teaching profession after a practice was no longer being actively promoted and made highly visible by several different sources of information or influences simultaneously were less likely to adopt that particular practice.

6. Then, too, it was found that the more innovative the teachers were, the more likely they were to recognize that they were more innovative than their peers. Coupled with this, it was interesting to note that 2.3 times more early adopters than the next highest categories perceived themselves as actively attempting to convince others about new practices in agricultural education. In running this self-perception role down, it was found that 72 per cent of the early adopters told other teachers about a new practice. The question is thus raised, is a person's self-perception of his role a factor which affects the adoption of innovations?

From the material which has been presented thus far, what implications exist for programs of teacher-education and supervision? In the speaker's judgment, the following implications are worthy of consideration.

1. If experienced teachers are influenced by different sources at the awareness stage, the interest stage, and the adoption stage in the innovation-adoption process, state staff personnel cannot afford the luxury of

depending on one or two sources to lead to the adoption of desirable innovations. By identifying all important sources, state staff members can utilize those sources extensively at the time and in the order in which their use will result in the greatest effectiveness and provide the greatest impact in influencing teachers to use new educational innovations. Also, an implication exists that systematic planning needs to be carried out to use these sources most efficiently. Then too, the implication exists that securing change must be considered a continual process involving multiple sources of information and influence.

2. Since the more innovative teachers are likely to use impersonal sources of information, the development of more bulletins, instructional aids, teaching hints, and similar sources of information will be of value in speeding up the adoption process involving the more innovative individuals. A converse implication is that personal contacts cannot be forsaken when working with the less innovative individuals in the late majority and laggard categories.

3. Since the more innovative teacher is likely to make greater use of sources outside of agricultural eduation, persons in the position to do so--school administrators, supervisors, teacher-educators--should provide an opportunity for the more innovative teachers, especially those in the early adopter category, to use and take advantage of such sources. Making it easy for teachers to use such outside sources would facilitate learning about new practices which possibly might be applicable to the school or classroom setting. Since the majority of teachers do not use outside sources, it is important that this means of injecting and diffusing new ideas obtained from outside the profession through the more innovative teachers be kept open. Those in the majority and laggard categories will follow the lead and actions of the more innovative teachers.

   However, because most teachers tend to use overwhelmingly large sources of information within their own field, such sources can serve as the vehicle of change in the change process. Another implication present is that personnel of the joint state staff can concentrate their efforts on purposive change within the framework of agricultural education.

4. The question is not answered whether a person is more innovative because he has more postgraduate education or seeks more education because he is more innovative. But the implication exists that since a correlation exists between the two, a permissive climate should be fostered by school administrators and state staff personnel which encourages teachers to continue their education without placing hurdles in their path. An example of such a hurdle might be a requirement that teachers on twelve month contracts could absent themselves from their job only once in three years for purposes of securing additional education.

Another implication exists that finding out how much education teachers have obtained in a formal, postgraduate program of education will provide some hint as to how the more innovative individuals or the less innovative individuals may be identified. Thus the amount of postgraduate education possessed can serve as a general characteristic of innovativeness.

5. It will be remembered that the more innovative teacher is likely to visit more vocational agriculture departments, other departments of instruction, and attend a greater number of non-local professional meetings than the less innovative teacher. It is readily apparent that the more innovative person does actively expose himself to or seek out those sources of information which are removed from the realm of the day-to-day aspects of his job. Consequently, he is likely to make his teaching more lively and vital. Therefore, an implication exists that it would be wise for school boards and school administrators to establish policies permitting and encouraging short-term professional improvement activities. As an example, school policies might permit such an activity as providing a paid substitute to free a person for a day to observe how a teacher in another school is conducting a specific program.

6. If it can be substantiated by further research that the more innovative teacher is likely to be a younger teacher, the implication is present that if state staff personnel wish to seek out new ways of doing things that are being used in the field, they could consider finding out what the "better" younger teachers are doing.

7. If it can be substantiated by further research that the more innovative teacher is likely to be one with fewer years of total teaching experience than the average, an implication exists that state staff personnel need to give more responsibilities and opportunities for roles in leadership development to the younger teachers, especially those in the early adopter category. For example, some of these teachers could be involved as "demonstrators" at conferences and in the field. Another implication which is present is that, if substantiated by further research, increasing teachers' salaries solely according to length of tenure may not most equitable. Then too, years of teaching experience might be another characteristic which may be useful in identifying innovativeness.

8. It will be recalled that the various sources which provide information that influences the adoption of educational innovations used by teachers tended to vary according to the adopter categories to which those teachers belonged even though the .05 level of significance was not attained. If substantiated by further research, an implication exists that state staff personnel need to determine purposefully the degree of innovativeness held by teachers. This needs to be done in order for state staff members to utilize those sources which can be most effective in bringing about change on the part of teachers in in various adopter categories.

9. It was shown that district supervisors can distinguish the relative degree of innovativeness possessed by teachers provided that they thoroughly understand the concept of innovativeness and its part in the change process and that they are well acquainted with the activities of the teachers within their respective districts. Since this is so, district supervisors could consciously and deliberately use persons in the different adopter categories according to the role they play and the position they hold among their peers to bring about desired, purposeful changes in agricultural education. For example, concentrated efforts could be made to utilize early adopters as cooperating teachers because of the high opinion-leadership role they play. Besides the early adopters, efforts could be made to include key members of the late majority in pilot programs since the latter individuals apparently exert a large degree of influence among their categorical peers as they maintain a larger number of face-to-face contacts within the category than they do with members of the more innovative categories.

10. The more innovative teacher is likely to be influenced by the cooperating teacher under whom he received his experience as a student teacher. Because these more innovative teachers tend to be the opinion leaders within the state, an implication exists that those persons selected as cooperating teachers should be the "pace-setters" for the profession in terms of new practices. In other words, their deeds are likely to be multiplied and to exert influence beyond the face-to-face contacts they have with student teachers working directly with them.

11. It was concluded that opinion-leadership is applicable to a specific age span and does not encompass the complete range of ages of individuals within the professional group. Since younger teachers hold lesser opinions of respect about teachers accepted as opinion leaders by the majority of teachersthan they do of individuals within their own age categories, an implication exists that state staff members should identify these emerging opinion leaders among this younger group of teachers and involve them on committees, in programs of pilot centers, and in other positions or activities where the influence they exert with their own peers can be used to lighten the efforts of the state staff in bringing about change.

12. Experienced teachers in the less innovative categories are influenced by their peers to a greater extent than are more innovative individuals. The implication exists that in attempting to wholesale efforts to create change on focusing attention on and working through opinion leaders in the early adopter categories, state staff personnel should not forget to include key members of the less innovative categories in the framework by which persons are made aware of, given additional information on, and influenced to adopt specific innovations. These less innovative persons need to be involved because of the direct personal influence they exert on peers within their respective adopter categories.

16. It was also concluded that the less innovative the experienced teacher is, the less likely he is to adopt a given practice if he perceives that more training in the use of the practice is needed. One implication present is that for innovations perceived as requiring additional training to be widely adopted, in-service training programs stressing help in the use of such practices need to be implemented, especially for the less innovative teacher. Another implication existing is that state staff personnel should not be too critical of the failure of teachers to adopt certain practices until they have had an opportunity to become familiar with and proficient in the use of that practice.

17. Since, it cannot be assumed that as new teachers enter the field they automatically are likely to adopt an already "established" practice which is considered desirable by state staff personnel, state staff personnel may periodically need to re-emphasize desirable practices by the use of a wide variety of sources of information and influence in order to maintain continual acceptance.

18. It was mentioned earlier that a given practice is most likely to be adopted by experienced teachers because it is implied by state staff personnel that this is the thing to do. Consequently, an implication exists that state staff personnel could be more positive in their recommendations and exert greater leadership in actively attempting to bring about specific change within a state's program of agricultural education. An additional implication exists that "innovational packaging" by state staff personnel could bring about faster rates of adoption. It would seem that through demonstration, preparation of guidelines, concerted effort by both teacher-educators and state supervisors, and other means of visibility that teachers could be made aware of and convinced of the value of a given practice.

19. We have seen that experienced teachers who are opinion leaders among the earlier adopters actively and knowingly attempt to influence other teachers. It would seem, therefore, that state staff personnel could benefit by actively encouraging these teachers to use a given practice. They could be involved in establishing demonstration centers. The actions of these opinion leaders in attempting to convince others could help the attempts of state staff personnel to bring about change through the trickle-down process. Monetary incentives could be provided by state staff personnel to school districts for use in departments of vocational agriculture to encourage teachers to use a given practice.

20. It was found that administrators and supervisors within the local school system exert relatively great influence on the adoption or non-adoption of educational innovations. An implication exists that state staff personnel and local school administrators or supervisors need to understand each other's objectives as well as work together in bringing about desirable practices in a local system if increased effectiveness is to result through the change process. Apparently, this is especially true of the "average" teacher in the majority categories.

21. The annual conference exerts relatively great influence at the awareness stage of the adoption process having been used 1.7 times more often at the awareness stage than at the adoption stage for those practices actually adopted by teachers. Could an implication exist that the real purpose of the annual conference for teachers of vocational agriculture sponsored by the state's supervisory staff may be to make teachers aware of new developments, methods, techniques, and concepts rather than to "train" or "up-grade" them in specific methods or techniques?

22. And lastly, it should be pointed out that the more innovative the experienced teacher is, the more likely he is to use non-mandatory sources of information. For example, because the more innovative teacher tends to use university staff members in agricultural education as sources of information and the less innovative teacher tends to use state supervisors as sources of information more frequently, an implication exists that both groups of personnel should work on promoting or upgrading the use of educational innovations within the state. Because of the visibility that promotion by more than one change agency provides, another implication exists that both groups should work out a planned program for "packaging" the adoption of innovations through simultaneous upgrading, promotion, or in-service education.

In conclusion, it is hoped that these insights into the adoption of educational innovations by teachers of vocational agriculture in one state may provide some food for thought as you work with the teachers in your respective states.

A STRATEGY FOR CHANGE

by
S. S. Sutherland
Emeritus Professor of Agricultural Education
University of California, Davis

Research should have as one of its primary objectives, the pointing of directions for change, and revealing facts and data which document the need for new directions. It would seem fitting, therefore, in the final stages of a seminar devoted to research and development that we turn our attention to ways and means of implementing the changes indicated by our research.

The time relationship between problem-oriented research and the emergence of problems requiring research is an interesting subject in itself, but one which we shall treat only in passing. A short time ago federal legislation suddenly cut off the supply of bracero labor from Mexico which had furnished the crews for harvesting California's huge tomato crop. Almost at once work was begun on developing machines which would take over the harvesting job, and to one of my friends was given the task of designing an entirely new type of tomato that would lend itself to machine harvesting. All he was asked to do was to develop a tomato which had all of the desirable characteristics of the present canning tomato, but also the additional ones which would make possible their being harvested by machine, such as an entirely different shape, a tough skin, and a variety which would all ripen at about the same time. By working night and day, growing two experimental crops of tomatoes a year--one in California in the summer and one in Mexico in the winter--he is finally getting close to his objective. Significant to me, however, is his statement based upon his experience in a situation in which the need for change was evident and accepted before the needed research was done. This was his conclusion--"When you have a situation needing research, it is already too late to research it"! You may not agree with his assessment of the time relationship between research and the need for change, but perhaps most of you would agree that you'd prefer to have the opportunity to do research thoroughly and without pressure rather than in a crisis or crash situation, and to have the pertinent facts and data before initiating change.

With the exception of this one detour, I propose to limit my discussion strictly to the assigned subject--"A Strategy for Change"--and to treat it from the point of view of you who, as leaders, shoulder the responsibility for initiating proposed changes and following them through to fruition and acceptance. In so doing, we shall take a look at the factors which mitigate against change, the feelings and attitudes of people which tend to obstruct change; our clientele--those whom we must persuade to accept change--and, finally, attempt to pull these items together into a procedure for initiating and gaining acceptance of proposals involving change.

My specific assignment for this paper is, and I quote, "From your accumulated experience and wisdom (sic) what suggestions do you have for state staffs in accelerating the speed of needed changes?" Therefore, from this accumulated experience, this alleged but highly questionable wisdom, generously supplemented by gleanings from research reported and conducted by Rogers[1] on diffusion of innovations and Abelson[2] on "Persuasion," I'll proceed with this assignment.

First let us look at obstructions to change, the factors which mitigate against change, the attitudes and feelings which often prevent acceptance of change, and try to relate them to our task of speeding up adjustments in agricultural and vocational education.

A major obstruction to acceptance of change is fear--fear of the unknown, fear of the consequences of change, fear that the changes may affect one adversely. Even a professional person, a district supervisor, a teacher often feels more comfortable in the stable situation he has dealt with and with which he has become familiar and becomes alarmed at the propsect of a new situation and fearful of his ability to cope with it.

Closely related to fear is our dislike of an ambiguous situation--one which is not clearly defined, and one which we do not clearly understand. In contrast to the proponent of the proposed change, the junior staff members, teachers, local administrators to whom he must present his plan will likely have had little opportunity to study intensely or think through his proposal, and perhaps no opportunity to do so. As a result they probably fail to understand it fully, nor do they sense or understand their role in it. Is it any wonder that under these conditions they may not immediately accept it?

A third block is distrust--distrust of the motives back of the proposal and especially distrust of the motives of the one making the proposal--the change agent. People tend to identify the change with the person who is proposing it. If they believe and trust him they are likely to accept; if they distrust and fear him or his motives they tend to transfer this attitude to the proposal with which he is identified.

A fourth inhibitor, of course, is tradition, inertia, an instinctive hesitancy on the part of most people (and educational institutions) to embark on a course which is radically different from that followed by their colleagues. For years the agriculture curricula of most of the land-grant colleges across the country resembled each other so closely that it was almost laughable. Course

---

titles, sequence, prerequisites, even units of credit differed little whether listed in catalogues from the Universities of Minnesota, Texas, California, or Pennsylvania. Now a few intrepid deans are breaking away from the pattern and introducing new curriculum patterns, but those of you who have been involved in such tasks will surely testify to the strength of tradition. We in vocational education are probably not entirely immune to this virus, either.

To these four blocks of resistance, Rogers, as a result of his own research findings and those of others studying innovation, adds another block which must be considered. This is the apparent fact that where there is a wide difference in status between the change agent and his clientele both communication and acceptance are impeded. The implications here, of course, are obvious--that the path of communication and acceptance should follow the so-called chain of command, both down and up; that a state director, for example, rather than going directly to teachers, should work instead with his immediate staff to gain their acceptance and with his immediate superior to gain his.

In addition to these inhibitors, which undoubtedly do not comprise a complete list, there are other pertient facts to be considered and which have a bearing on acceptance of new ideas. For example, it has been stated that educated persons tend to be more receptive to change than those less well educated; that the educated person is likely to change as a result of reason and facts rather than to be swayed by emotion; that we tend to accept milder changes more readily than radical ones, and gradual changes more easily than abrupt ones.

Building on this groundwork, then, what should be our own strategy for change? How can we, when research has identified and documented the need for change, initiate and gain acceptance of proposals to bring this change into being?

There are at least three ways of effecting change: (1) the autocratic, authoritarian; (2) the completely democratic approach; and (3) a middle of the road procedure which combines some of the elements of both the autocratic and the democratic.

The first method consists merely of an executive order that on such and such a date certain specified rules, regulations, and procedures will go into effect and will be followed--period. While most of us dislike this method when applied to us, it has its place, especially when the change is required as a result of new state or federal legislation or policy.

In theory, the democratic approach, in which all of those affected by the change have an opportunity right from the start to think through, discuss, plan, and implement the change together, should be the most effective for it brings into play somewhat equal involvement of the group who are directly concerned. The plan, then, becomes their own

instead of yours. In practice, it has obvious limitations and frustrations. The democratic procedure, excellent as it is, is notoriously slow and laborious, and often frustrating.

Since group planning is such a difficult process the middle of the road procedure often is a good compromise. In this process the planning of the proposal is done either by an individual or a very small group. It is planned as completely as possible, documented by facts, objectives clearly established, arguments pro and con listed, and then presented to the rest of those affected, not necessarily for acceptance or rejection, but for reactions and suggestions. It is important in this procedure that it be made entirely clear that the plan presented is not presented as a finished product, will not necessarily be put into effect in its present form, nor is any time table presented. Rather one must emphasize that the suggestions, additions, deletions agreed upon as a result of these reaction-discussions will be incorporated into the plan before it is put into effect. It should be obvious that this promise must be adhered to strictly and to the letter. A dean emeritus of the College of Agriculture where I labored said in presenting proposals he always made it a point to leave a few "i's" undotted and a few "t's" uncrossed because from his experience people had to find something to criticize, so he gave them a target on purpose and one that wouldn't cause much damage. Finally, when the plan is presented for reactions, suggestions, and criticisms do not defend it. To do so is fatal at this juncture. Simply make sure that there is agreement concerning the suggestions and record them for consideration, and probably incorporation in the plan.

While this should not be construed to be a recommendation of this middle of the road plan of action over the purely democratic or the purely authoritarian, it certainly merits consideration. As Rogers concluded, we as change agents should be more concerned with improving the ability of our client to evaluate new ideas and less with out and out promoting and drum-beating. Furthermore,this method may be used equally well with the four groups with which we must be concerned in a strategy of change; our superiors who have the decision and veto power, our immediate staff of assistant supervisors or teacher educators, local teachers, and local administrators.

Now as to the proposal itself and its essential elements. Whether a plan is presented for immediate concurrence or for evaluation and criticism, the hoped-for outcome, of course, is eventual acceptance. To obtain this acceptance careful consideration must be given to removing or nullifying the roadblocks and inhibitors discussed earlier in this paper. Therefore it should include these elements:

1. The objectives, the outcomes, the hoped-for accomplishments of the change must not only be spelled out clearly, but also must be such as to win the immediate and unquestioned approval of those affected. (Unless your staff and your teachers accept the purpose--the goal, you may be sure they will not accept the change.) If this

step is omitted or not done well, your plan is doomed for failure regardless of how well the rest of it is done. These outcomes should be expressed in terms of accomplishments which will benefit your clients--teachers and assistants--which they value, and for which they can sense the need. Done in this way, it should serve to dispel any distrust of you or your motives and their natural fear of the consequences of the change. Again, this may well be the single most important step in your strategy for change.

2. State and describe the proposed change clearly, present all pertinent facts and data upon which it is based. Use all possible aids to enable your clients to visualize it and to understand it. This should serve in a measure to remove some of the ambiguity implicit to change and enable them to see just exactly what is involved.

3. Present evidence, facts, and arguments, both for and against the proposed change. Really analyze it. This is especially important if you anticipate severe opposition or criticism. Doing so may serve to allay their fears that you and your planning committee may not have considered all aspects and consequences of the proposed change. If critical opposition is not anticipated, arguments against the change may be omitted, but it seems safer to include them, since they should aid your hearers in making a fairer evaluation.

At this stage, if you can show that other states or agencies have already successfully adopted this pattern you may be able to remove still another roadblock.

4. Gear the wording of your proposal to your clientele and their known characteristics, attitudes, opinions, and values. Use their language--not yours.
